Mr Hofmeyr’s Policy.—In 1882 an act was passed in the Cape legislative assembly, empowering members to speak in the Dutch language on the floor of the House, if they so desired. The introduction of this act was a liberal one, but the moment its introduction was inopportune, and its effect was to give an additional stimulus to the policy of the Bond. It was probably also the means of bringing into the House a number of Dutchmen, by no means well educated, who would have been returned had they been obliged to speak English. By this act an increase of influence was given to the Dutch leaders. The head of the Afrikander Bond at this time in Cape Colony, and the leader of Dutch opinion, was Mr J. H. Hofmeyr, a man of undoubted ability and astuteness. Although he was recognized leader of the Dutch party in Cape Colony, he consistently refused to take office, preferring to direct the policy and the action of others from an independent position. Mr Hofmeyr sat in the house of assembly as member for Stellenbosch, a strong Dutch constituency. His influence over the Dutch members was supreme, and in addition to directing the policy of the Bond within the Cape Colony, he supported and defended the aggressive expansion policy of President Kruger and the Transvaal Boers. In 1883, during a debate on the Basutoland Dis-annexation Bill, Rhodes openly charged Mr Hofmeyr in the House with a contradiction in his policy, describing himself as a “British and its flag.” In 1884, Mr Hofmeyr led the Bond in strongly supporting the Transvaal Boers who had invaded Bechuanaland (g.v.), proclaiming that if the Bechuanaland freebooters were not permitted to retain the territories they had seized, in total disregard of the terms of the conventions of 1881 and 1884, there would be rebellion among the Dutch of Cape Colony. Fortunately, however, for the peace of Cape Colony at that time, Sir Charles Warren, sent by the imperial government to maintain British rights, removed the invading Boers from Stellaland and Goshen—two so-called republics set up by the Boer freebooters—in March 1885 and no rebellion occurred. Nevertheless the Bond party was so strong in the House that they compelled the ministry under Sir Thomas Scanlen to resign in 1884. The logical and constitutional course for Mr Hofmeyr to have followed in these circumstances would have been to accept office and himself form a government. This he refused to do. He preferred to put in a nominee of his own who should be entirely dependent on him. Mr Upington, a clever Irish barrister, was the man he selected, and he himself was formed 1885, that will always be known in Cape history as the “Warming-pan” ministry. This action was denounced by many British colonists, who were sufficiently loyal, not only to Great Britain, but also to that constitution which had been conferred by Great Britain upon Cape Colony, to desire to see the man who really wielded political power also acting as the responsible head of the party. It was Mr Hofmeyr’s refusal to accept this responsibility, as well as the nature of his Bond policy, which won for him the political sobriquet of the “Mole.” Open and responsible exercise of a power conferred under the constitution of the country, Englishmen and English colonists would have accepted and even welcomed. But that subterranean method of Dutch policy which found its strongest expression in Pretoria, and which operated from Pretoria to Cape Town, could not but be resented by loyal colonists. From 1885 down to 1898, Mr Hofmeyr practically determined how Dutch members should vote, and also what policy the Bond should adopt at every juncture of its life. In 1885 he rejected his own act of 1884—an action which made his political dictatorship still more remarkable. This influence on Cape politics was a demoralizing one. Other well-known politicians at the Cape subsequently found it convenient to adapt their views a good deal too readily to those held by the Bond. In justice to Mr Hofmeyr, however, it is only fair to say that after the Warren expedition in 1885, which was at least evidence that Great Britain did not intend to renounce her supremacy in South Africa altogether, he adopted a less hostile or anti-British attitude. The views and attitude of Mr Hofmeyr between 1887 and 1884—when even loyal British colonists, looking to the events which followed Majuba, had almost come to believe that Great Britain had little desire to maintain her supremacy—can scarcely be wondered at.
Rhodes and Dutch Sentiment.—Recognizing the difficulties of the position, Cecil Rhodes from the outset of his political career showed a desire to conciliate Dutch sentiment by considerate treatment and regard for Dutch prejudices. Rhodes was first returned as member of the House of Assembly for Barkly West in 1880, and in spite of all vicissitudes this constituency remained loyal to him. He supported the bill permitting Dutch to be used in the House of Assembly in 1882, and early in 1884 he took office, as treasurer-general, under Sir Thomas Scanlen. Rhodes had only held this position for six weeks when Sir Thomas Scanlen resigned, and in August of the same year he was sent by Sir Hercules Robinson to British Bechuanaaland as deputy-commissioner in succession to the Rev. John Mackenzie, the London Missionary Society’s representative at Kuruman, who in the previous May had proclaimed the queen’s authority over the district. Rhodes’s efforts to conciliate the Boers failed—hence the necessity for the Warren mission. In 1885 the territories of Cape Colony were farther extended, and Tembuland, Bovanaland and Gakekaland were formally added to the colony. In 1886 Sir Gordon Sprigg succeeded Sir Thomas Upington as premier of the colony.

South African Customs Union.—The period from 1878 to 1883 in Cape Colony had been one of considerable unrest. In this short time, in addition to the chronic troubles with the Basutos—which led the Cape to hand them over to the imperial authorities—there occurred a series of native disturbances which were followed by the Boer War of 1881, and the Bechuanaland disturbances of 1884. In spite, however, of these drawbacks, the development of the country proceeded. The diamond industry was flourishing. In 1887 a conference was held in London for “promoting a closer union between the various parts of the British empire by means of an imperial tariff of customs.” At this conference it was worthy of note that Mr Hofmeyr proposed a sort of “Zollverein” scheme, in which imperial customs were to be levied independently of the duties payable on all goods entering the empire from abroad. In making the proposition he stated that his objects were “to promote the union of the empire, and at the same time to obtain revenue for the purposes of general defence.” The scheme was not at the time found practicable. But its authorship, as well as the sentiments accompanying it, created a favourable view of Mr Hofmeyr’s attitude. In the year 1888, in spite of the failure of statesmen and high commissioners to bring about political confederation, the members of the Cape parliament set about the establishment of a South African Customs Union. A Customs Union Bill was passed, and in itself constituted a considerable development of the idea of federation. Shortly after the passing of the bill the Orange Free State entered the union. An endeavour was also made then, and for many years afterwards, to get the Transvaal to join. But President Kruger, consistently pursuing his own policy, hoped through the Delagoa Bay railway to make the South African Republic entirely independent of Cape Colony. The endeavour to bring about a customs union which would embrace the Transvaal was also little to the taste of President Kruger’s Hollander advisers, interested as they were in the schemes of the Netherlands Railways to extend their Transvaal and Orange Free State interests.

Diamonds and Railways.—Another event of considerable commercial importance to the Cape Colony, and indeed to South Africa, was the amalgamation of the diamond-mining companies, chiefly brought about by Cecil Rhodes, Alfred Beit and “Barney” Barnato, in 1889. One of the principal and most beneficent results of the discovery and development of the diamond mines was the great impetus which it gave to railway extension. Lines were opened up to Worcester and Beaufort West, to Graham’s Town, Graaff Reinet and Queens-town. Kimberley was reached in 1885. In 1890 the line was extended northwards on the western frontier of the Transvaal as far as Vryburg in Bechuanaaland. In 1895 the Free State entered into an arrangement with the Cape Colony whereby the main trunk railway was extended to Bloemfontein, the Free State receiving half the profits. Subsequently the Free State bought at cost price the portion of the railway in its own territory. In 1891 the Free State railway was still farther extended to Viljoen’s Drift on the Vaal river, and in 1892 it reached Pretoria and Johannesburg.

Rhodes as Prime Minister: Native Policy.—In 1889 Sir Henry Loch was appointed high commissioner and governor of Cape Colony in succession to Sir Hercules Robinson. In 1890 Sir Gordon Sprigg, the premier of the colony, resigned, and a Rhodes government was formed. Prior to the formation of this ministry (see table at end of article), and while Sir Gordon Sprigg was still in office, Mr Hofmeyr approached Rhodes and offered to put him in office as a Bond nominee. This offer was declined. When, however, Rhodes was invited to take office after the downfall of the Sprigg ministry, he asked the Bond leaders to meet him and discuss the situation. His policy of customs and railway unions between the various states, added to the personal esteem in which he was at this time held by many of the Dutchmen, enabled him to undertake and carry on successfully the business of government.

The colonies of Bechuanaeland and Basutoland were now taken into the customs union existing between the Orange Free State and Cape Colony. Pondoland, another native territory, was added to the colony in 1894, and the year was marked by the Glen Grey Act, a departure in native policy for which Rhodes was chiefly responsible. It dealt with the natives residing in certain native reserves, and in addition to providing for their interests and holdings, and in other ways protecting the privileges accorded to them, the principle of the duty of some degree of labour devolving upon every able-bodied native enjoying these privileges was asserted, and a small labour tax was levied. This is in many respects the most statesmanlike act dealing with natives on the statute-book; and in the session of 1895 Rhodes was able to report to the Cape parliament that the act then applied to 160,000 natives. In 1905 the labour clauses of this act, which had fallen into desuetude, were repealed. The clauses had, however, achieved success, in that they had caused many thousands of natives to fulfill the conditions requisite to claim exemption.

In this respect Rhodes’s native policy was marked by combined consideration and firmness. Ever since the granting of self-government the natives had enjoyed the franchise. An act passed in 1892, at the instance of Rhodes, imposed an educational test on applicants for registration, and made other provisions, tending to restrict the acquisition of the franchise by “tribal” natives, the possible danger arising from a large native vote being already obvious (see section Constitution).

Rhodes opposed the native-liquor traffic, and at the risk of offending some of his supporters among the brandy-farmers of the western provinces, he suppressed it entirely on the diamond mines, and restricted it as far as he was able in the native reserves and territories. Nevertheless the continuance of this traffic on colonial farms, as well as to some extent in the native territories and reserves, is a black spot in the annals of the Cape Colony. The Hottentots have been terribly demoralized, and even partially destroyed by it in the western provinces.

Another and little-known instance of Rhodes’s keen insight in dealing with native affairs—an action which had lasting results on the policy of the colony—may be given. After the native territories east of the Kei had been added to Cape Colony, a case of claim to inheritance came up for trial, and in accordance with the law of the colony, the court held that the eldest son of a native was his heir. This decision created the strongest resentment among the people of the territory, as it was in distinct

1 The act enjoined that “every male native residing in the district, exclusive of natives in possession of lands under ordinary quit-rent tenure, and any male native who owns the right of the residence of an occupant is fit for and capable of labour, shall pay to the public revenue a tax of ten shillings per annum unless he can show to the satisfaction of the magistrate that he has been in service beyond the borders of the district for at least three months out of the previous twelve, when he will be exempt from the tax for that year, or unless he can show that he has been employed for a total period of three years, when he will be exempt altogether.”
contradiction to native tribal law, which recognized the great son, or son of the chief wife, as heir. The government were threatened with a native disturbance, when Rhodes telegraphed his assurance that compensation should be granted, and that such a decision should never be given again. This assurance was accepted and tranquility restored. At the close of the next session (that of 1894), after this incident had occurred, Rhodes laid on the table a bill drafted by himself, the shortest the House had ever seen. It provided that all civil cases were to be tried by magistrates, an appeal to lie only to the chief magistrate of the territory with an assessor. Criminal cases were to be tried before judges of supreme court on circuit. The bill was passed, and the effect of it was, inasmuch as the magistrates administered according to native law, that native marriage customs and laws (including polygamy) were legalized in these territories. Rhodes had retrieved his promise, and no one who has studied and lived amongst the Bantu will question that the action taken was both beneficent and wise.

During 1895 Sir Hercules Robinson was reappointed governor and high commissioner of South Africa in succession to Sir Henry Loch, and in the same year Mr Chamberlain became secretary of state for the colonies in the United Kingdom for commercial federation. — With the development of railways, and the extension of trade between Cape Colony and the Transvaal, there had grown up a closer relationship on political questions. Whilst premier of Cape Colony, by means of the customs union and in every other way, Rhodes endeavoured to bring about a friendly measure of at least commercial federation among the states and colonies of South Africa. He hoped to establish both a commercial and a railway union, and a speech which he made in 1894 at Cape Town admirably describes this policy:

"With full affection for the flag which I have been born under, and the flag I represent, I can understand the sentiment and feeling of a republican who has created his independence, and values that better, but I can say fairly that I believe in the future that I can assimilate the system, which I have been connected with, with the Cape Colony, and it is not an impossible idea that the neighbouring republics, retaining their independence, should share with us as to certain general principles. If I might put it to you, I would say the principles of tariffs, the principle of railway connexion, the principle of appeal in law, the principle of coinage, and in fact all those principles which exist at the present moment in the United States, irrespective of the local assemblies which exist in each separate state in that country."

To this policy President Kruger and the Transvaal government offered every possible opposition. Their action in what is known as the Vaal River Drift question will best illustrate the line of action which the Transvaal government believed it expedient to adopt. A difficulty arose at the termination of the agreement in 1894 between the Cape government railway and the Netherlands railway. The Cape government, for the purposes of carrying the railway from the Vaal river to Johannesburg, had advanced the sum of £600,000 to the Netherlands railway and the Transvaal government conjointly; at the same time it was stipulated that the Cape government should have the right to fix the traffic rate until the end of 1894, or until such time as the Delagoa Bay— Pretoria line was completed. These rates were fixed by the Cape government at 2d. per ton per mile, but at the beginning of 1895 the rate for the 52 miles of railway from the Vaal river to Johannesburg was raised by the Netherlands railway to no less a sum than 8d. per ton per mile. It is quite evident from the action which President Kruger subsequently took in the matter that this charge was put on with his approval, and with the object of compelling traffic to be brought by the Transvaal by the Delagoa route, instead of as heretofore by the colonial railways, in order to compete against this very high rate, the merchants of Johannesburg began removing their goods from the Vaal river by waggon. Therupon President Kruger arbitrarily closed the drifts (fords) on the Vaal river, and thus prevented through waggon traffic, causing an enormous block of waggons on the banks of the Vaal. A protest was then made by the Cape government against the action of the Transvaal, on the ground that it was a breach of the London Convention.

President Kruger took no notice of this remonstrance, and an appeal was made to the imperial government; whereupon the latter entered into an agreement with the Cape government, to the effect that if the Cape would bear half the cost of any expedition which should be necessary, assist with troops, and give full use of the Cape railway for military purposes if required, a protest should be sent to President Kruger on the subject. These terms were accepted by Rhodes and his colleagues, of whom Mr W. P. Schreiner was one, and a protest was then sent by Mr Chamberlain stating that the government would regard the closing of the drifts as a breach of the London Convention, and as an unfriendly action calling for the gravest remonstrance. President Kruger at once reopened the drifts, and undertook that he would issue no further proclamation on the subject except after consultation with the imperial government.

On the 29th of December 1895 Dr Jameson (q.v.) made his famous raid into the Transvaal, and Rhodes' complicity in this movement compelled him to resign the premiership of Cape Colony in January 1896, the vacant post being taken by Sir Gordon Sprigg. As Rhodes' complicity in the raid became known, there naturally arose a strong feeling of resentment and dissatisfaction in South Africa, and the Transvaal ministry, who had been kept in complete ignorance of his connexion with any such scheme. Mr Hofmeyr and the Bond were loud in their denunciation of him, nor can it be denied that the circumstances of the raid greatly embittered against us the Dutch element in Cape Colony, and influenced their subsequent attitude towards the Transvaal Boers.

In 1897 a native rising occurred under Galeshwe, a Bantu chief, in Griqualand West. Galeshwe was arrested and the rebellion repressed. On cross-examination Galeshwe stated that Bosman, a magistrate of the Transvaal, had supplied ammunition to him, and urged him to rebel against the government of Cape Colony. There is every reason to suppose that this charge was true, and it is consistent with the intrigues which the Boers from time to time practised amongst the natives.

In 1897 Sir Alfred Milner was appointed high commissioner of South Africa and governor of Cape Colony, in succession to Sir Hercules Robinson, who had been created a peer under the title of Baron Rosmead in August 1895. The idea of commercial federation in South Africa advanced another stage, Natal entering the customs union. A fresh convention was drafted at this time, and under it "a uniform tariff on all imported goods consumed within such union, and an equitable distribution of the duties collected on such goods amongst the parties to such union, and free trade between the colonies and state in respect of all South African products," was arranged. In the same year, too, the Cape parliamentary election occurred, and the result was the return to power of a Bond ministry under Mr W. P. Schreiner. From this time, until June 1900, Mr Schreiner remained in office as head of the Cape government. During the negotiations (see TRANSVAAL) which preceded the war in 1899, feeling at the Cape ran very high, and Mr Schreiner's attitude was very freely discussed. As head of a party, dependent for its position in power on the Bond's support, his position was undoubtedly a trying one. At the same time, as prime minister of a British colony, it was strongly felt by loyal colonists that he should at least have refrained from openly interfering between the Transvaal and the imperial government during the course of most astute negotiations. His public expressions of opinion were hostile in tone to the policy pursued by Mr Chamberlain and Sir Alfred Milner. The effect of them, it was believed, might conceivably be to encourage President Kruger in persisting in his rejection of the British terms. Mr Schreiner, it is true, used directly what influence he possessed to induce President Kruger to adopt a reasonable course. But however excellent his intentions, his publicly expressed disapproval of the Chamberlain-Milner policy probably did more harm than his private influence with Mr Kruger could possibly do good. On the 11th of June 1899, shortly after the Bloemfontein conference, from which Sir Alfred Milner had just returned, Mr Schreiner asked the high
commissioner to inform Mr Chamberlain that he and his colleagues agreed in regarding President Kruger's Bloemfontein proposals as "practical, reasonable and a considerable step in the right direction." Early in June, however, the Transvaal politicians began to realize that President Kruger's attitude was not so reasonable as they had endeavoured to persuade themselves, and Mr Hofmeyr, accompanied by Mr Herholdt, the Cape minister of agriculture, visited Pretoria. On arrival, they found that the Transvaal Volksraad, in a spirit of defiance and even levity, had just passed a resolution offering four new seats in the Volksraad to the mining districts, and fifteen to exclusively burgher districts. Mr Hofmeyr, on meeting the executive, freely expressed indignation at these proceedings. Unfortunately, Mr Hofmeyr's influence was more than counter-balanced by an emissary from the Free State, Mr Abraham Fischer, who, while purporting to be a peacemaker, practically encouraged the Boer executive to take extreme measures.

Mr Hofmeyr's established reputation as an astute diplomatist, and as the trusted leader for years of the Cape Dutch party, made him as powerful a delegate as it was possible to find. If any emissary could accomplish anything in the way of persuading Mr Kruger, it was assuredly Mr Hofmeyr. Much was looked for from his mission by moderate men of all parties, and by none more so, it is fair to believe, than by Mr Schreiner. But Mr Hofmeyr's mission, like every other mission to Mr Kruger, to induce him to take a reasonable and equitable course, proved entirely fruitless. He returned to Cape Town disappointed, but probably not altogether surprised at the failure of his mission. Meanwhile a new proposal was drafted by the Boer executive, which, before it was received in its entirety, or at least before it was clearly understood, elicited from Mr Schreiner a letter on the 7th of July to the South African News, in which, referring to his government, he said:

"While anxious and continually active with good hope in the cause of securing reasonable modifications of the existing representative system of the South African Republic, this government is convinced that no ground whatever exists for active interference in the internal affairs of that republic."

This letter was precipitate and unfortunate. On the 11th of July, after seeing Mr Hofmeyr on his return, Mr Schreiner made a personal appeal to President Kruger to approach the imperial government in a friendly spirit. At this time an incident occurred which raised the feeling against Mr Schreiner to a very high pitch. On the 7th of July 500 rifles and 1,000,000 rounds of ammunition were landed at Port Elizabeth, consigned to the Free State government, and forwarded to Bloemfontein. Mr Schreiner's attention was called to this consignment at the time, and he refused to stop it, alleging as his reason that, inasmuch as Great Britain was at peace with the Free State, he had no right to interdict the passage of arms through the Cape Colony. The British colonist is as capable of a grim jest as the Transvaal Boer, and this action of Mr Schreiner's won for him the nickname "ammunition Bill." At a later date he was accused of delay in forwarding artillery and rifles for the defence of Kimberley, Mafeking and other towns of the colony. The reason he gave for delay was that he did not anticipate war; and that he did not wish to excite unwarrantable suspicions in the minds of the Free State. His conduct in both instances was perhaps technically correct, but it was much resented by loyal colonists.

On the 28th of July Mr Chamberlain sent a conciliatory despatch to President Kruger, suggesting a meeting of delegates to consider and report on his last franchise proposals, which were complex to a degree. Mr Schreiner, on the 3rd of August, telegraphed to Mr Fischer begging the Transvaal to welcome Mr Chamberlain's proposal. At a later date, on receiving an inquiry from the Free State as to the movements of British troops, Mr Schreiner curtly refused any information, and referred the Free State to the high commissioner. On the 28th of August Sir Gordon Sprigg in the House of Assembly moved the adjournment of the debate, to discuss the removal of arms to the Free State. Mr Schreiner, in reply, used expressions which called down upon him the severest censure and indignation, both in the colony and in Great Britain. He stated that, should the storm burst, he would keep the colony aloof with regard both to its forces and its people. In the course of the speech he also read a telegram from President Steyn, in which the president repudiated all contemplated aggressive action on the part of the Free State as absurd. This speech created great sensation in the British press. It was probably forgotten at the time (though Lord Kimberley afterwards publicly stated it) that one of the chief reasons why the Gladstone government had granted the retrocession of the Transvaal after Majuba, was the fear that the Cape Colonial Dutch would join their kinsmen in the war continued. What was a danger in 1881, Mr Schreiner knew to be a still greater danger in 1899. At the same time it is quite obvious, from a review of Mr Schreiner's conduct through the latter half of 1899, that he took an entirely mistaken view of the Transvaal situation. He evinced, as premier of the Cape Colony, the same inability to understand the Uitlanders' grievances, the same futile belief in the eventual fairness of President Kruger, as he had shown when giving evidence before the British South Africa Select Committee into the causes of the Jameson Raid. Actual experience taught him that President Kruger was beyond an appeal to reason, and that the protestations of President Steyn were insincere. War had no sooner commenced with the ultimatum of the Transvaal Republic on the 9th of October 1899, than Mr Schreiner found himself called upon to deal with the conduct of Cape rebels. The rebels joined the invading forces of President Steyn, whose false assurances Mr Schreiner had offered to an indifferent House of Assembly only a few weeks before. The war on the part of the Republics was evidently not to be merely one of self-defence. It was one of aggression and aggravandissement. Mr Schreiner ultimately addressed, as prime minister, a sharp remonstrance to President Steyn for allowing hisburgers to invade the colony. He also co-operated with Sir Alfred Miller, and used his influence to restrain the Bond.

The War of 1899-1902.—The first shot actually fired in the war was at Krupaia, a small railway station within the colony, 40 m. south of Mafeking, a train being derailed, and ammunition intended for Colonel Baden-Powell seized. The effect of this was entirely to cut off Mafeking, the northernmost town in Cape Colony, and it remained in a state of siege for over seven months. On the 16th of October Kimberley was also isolated. Proclamations by the Transvaal and Free State annexing portions of Cape Colony were actually issued on the 18th of October, and included British Bechuanaland and Griqualand West, with the diamond fields. On the 28th of October Mr Schreiner signed a proclamation issued by Sir Alfred Milner as high commissioner, declaring the Boer annexations of territory within Cape Colony to be null and void.

Then came the British reverses at Mafersfontein (on the 11th of December) and Stormberg (on the 10th of December). The effect of these engagements at the very outset of the war, occurring as they did within Cape Colony, was to offer every inducement to a number of the frontier colonial Boers to join their kinsmen of the republics. The Boers were prolific, and their families large. Many younger sons from the colony, with nothing to lose, left their homes with horse and rifle to join the republican forces.

Meanwhile the loyal Cape colonists were chafing at the tardy manner in which they were enrolled by the imperial authorities. It was not until after the arrival of Lord Roberts and Lord Kitchener at Cape Town on the 10th of January 1900 that these invaluables, and many of them experienced, men were freely invited to come forward. So strongly did Lord Roberts feel on the subject, that he at once made Colonel Brabant, a well-known and respected colonial veteran and member of the House of Assembly, a brigadier-general, and started recruiting loyal colonists in earnest. On the 15th of February Kimberley was relieved by General French, and the Boer general, Cronje, evacuated Mafersfontein, and retreated towards Bloemfontein. Cecil Rhodes was shut up in Kimberley during the whole of the siege, and his presence there undoubtedly offered an additional

See also TRANSVAAL.
incentive to the Boers to endeavour to capture the town, but
his unique position and influence with the De Beers workmen
enabled him to render yeoman service, and infused enthusiasm
and courage into the inhabitants. The manufacture of a big
gun, which was able to compete with the Boer “Long Tom,”
at the De Beers workshops, under Rhodes’s orders, and by the
ingenuity of an American, Mr. Labram, who was killed a few days
after its completion, forms one of the most striking incidents of
the period.

With the relief of Mafeking on the 17th of May, the Cape
rebellion ended, and the colony was, at least for a time, delivered
of the presence of hostile forces.

On the 20th of March Mr (afterwards Sir James) Rose-Innes,
a prominent member of the House of Assembly, who for several
years had held aloof from either party, and who also had defended
Mr Schreiner’s action with regard to the passage of arms to the
Free State, addressed his constituents at Claremont in support
of the annexation of both republics; and in the course of an
eloquent speech he stated that in Canada, in spite of rebellions,
loyalty had been secured from the French Canadians by free
institutions. In South Africa they might hope that a similar
policy would attain a similar result with the Boers. In June,
Mr Schreiner, whose recent support of Sir Alfred Milner had
incurred the displeasure of his Bond followers, resigned in consequence
of the refusal of some of his colleagues to support the disfranchise-
ment bill which he was prepared, in accordance with the views
of the home government, to introduce for the punishment of
Cape rebels. The bill certainly did not err on the side of severity,
but disfranchisement for their supporters in large numbers was
more distasteful to the Bond extremists than any stringency
among individuals. Sir Gordon Sprigg, who after a political
crisis of considerable delicacy, succeeded Mr Schreiner and for
the fourth time became prime minister, was able to pass the
Bill with the co-operation of Mr Schreiner and his section.
Towards the end of the year 1900 the war entered on a new
phase, and took the form of guerrilla skirmishes with scattered
forces of marauding Boers. In December some of these bands
entered the Cape Colony and endeavoured to induce colonial
Boers to join them. In this endeavour they met at first with
little or no success; but as the year 1901 progressed and the
Boers still managed to keep the various districts in a ferment, it
was deemed necessary by the authorities to proclaim martial
law over the whole colony, and this was done on the 9th of
October 1901.

On the 4th of January 1901 Sir Alfred Milner was gazetted
governor of the Transvaal and Orange River Colony, being
shortly afterwards created a peer as Lord Milner, and Sir Walter
Hely-Hutchinson, governor of Natal, was appointed his successor
as governor of the Cape Colony. The office of high commissioner
in South Africa was now separated from the governorship of
the Cape and associated with that of the Transvaal—an indication
of the changed conditions in South Africa. The division of the
colonists into those who favoured the Boer states and those
firmly attached to the British connexion was reflected, to the
detriment of the public weal, in the parties in the Cape parliament.
Proposals were made to suspend the constitution, but this
drastic course was not adopted. The Progressive party, the
name taken by those who sought a permanent settlement under
the British flag, lost their leader, and South Africa its foremost
statesman by the death, in May 1902, of Cecil Rhodes, a few
weeks before the end of the war.

After the War—The acknowledgement of defeat by the Boers
in the war enabled the Boers, under the supervision of some 10,000 rebels, did not
weaken the endeavours of the Dutch to obtain political supremacy
in the colony. Moreover, in the autumn of 1902 Sir Gordon
Sprigg, the prime minister, nominally the leader of the Progressives,
sought to maintain his position by securing the support of
the Bond party in parliament. In the early part of 1903
Mr Chamberlain included Cape Town in his visit to South Africa,
and had conferences with the political leaders of all parties.
Reconciliation between the Bond and British elements in
the colony was, however, still impossible, and the two parties con-
centrated their efforts in a struggle for victory at the coming
election. Mr Hofmeyr, who had chosen to spend the greater
part of the war period in Europe, returned to the Cape to re-
organize the Bond. On the other side Dr Jameson came forward
as the leader of the Progressives. Parliament was dissolved
in September 1903. It had passed, since the war, two measures
of importance—one (1902) restricting alien immigration, the
other (1903) ratifying the first customs convention between all
the South African colonies. This convention was notable for its
grant of preferential treatment (in general, a rebate of 25% on
the customs already levied) to imports from the United Kingdom.

The election turned on the issue of British or Bond supremacy.
It was fought on a register purged of the rebel voters, many of
whom, besides being disfranchised, were in prison. The issue
was doubtful, and each side sought to secure the support of
the native voters, who in several constituencies held the balance
of power. The Bondsmen were more lavish than their opponents
in their promises to the natives and even invited a Kaffir jour-
nalist (who declined) to stand for a seat in the Assembly. In view
of the agitation then proceeding for the introduction of Chinese
coolies to work on the mines on the Rand, the Progressives declared
their intention, if returned, to exclude them from the colony,
and this declaration gained them some native voters. The polling
showed that 48,552 votes were cast in favour of the Bondsmen,
while 45,236 went to the Progressives. It was agreed that two of
five in a house of 95 members. The rejected candidates
included prominent Bond supporters like Mr Merriman and Mr Sauer,
and also Sir Gordon Sprigg and Mr A. Douglass, another
member of the cabinet. Mr W. P. Schreiner, the ex-premier,
who stood as an Independent, was also rejected.

The Jameson Ministry.—On the 18th of February Sir Gordon
Sprigg resigned and was succeeded by Dr L. S. Jameson,
who formed a ministry wholly British in character. The first
task of the new government was to introduce (on the 4th of March)
an Additional Representation Bill, to rectify—in part—the
disparity in electoral power of the rural and urban districts.
Twelve new seats in the House of Assembly were divided among
the larger towns, and three members were added to the legislative
council. The town voter being mainly British, the bill met with
the bitter opposition of the Bond members, who declared that
its object was the extinction of their parliamentary power.
In fact, the bill was called for by the glaring anomalies in the
distribution of seats by which a minority of voters in the country
districts returned a majority of members, and it left the towns
better represented than the rural areas by two to three or four
or three Dutch members, who were the object of violent attack
by the Bondsmen. It became law, and the elections for the additional
seats were held in July, after the close of the session.
They resulted in strengthening the Progressive majority both in
the House of Assembly and in the legislative council—where
the Progressives previously had a majority of one only.

At the outset of its career the Jameson ministry had to face
a serious financial situation. During the war the supply of the
army in the field had caused an artificial inflation of trade, and
the Sprigg ministry had pursued a policy of extravagant expendi-
ture not warranted by the finances of the colony. The slow
recovery of the gold-mining and other industries in the Transvaal
after the war was reflected in a great decline in trade in Cape
Colony during the last half of 1903, the distress being aggravated
by severe drought. When Dr Jameson assumed office he found
an empty treasury, and considerable temporary loans had to be
raised. Throughout 1904, moreover, revenue continued to
shrink—compared with 1903 receipts dropped from £1,710,000
in 1902 to £67,000 in 1904. The government, besides cutting down official
salaries and exercising stringent economy, contracted (July 1904) a loan for
£3,000,000. It also passed a bill imposing a graduated tax (6d. to 1s. in the £) on all incomes over £1,000. A substantial
excise duty was placed on spirits and beer, measures of relief
for the brandy-farmers being taken at the same time. The result
was that while there was a deficit on the budget of 1904–
1905 of £731,000, the budget of 1905–1906 showed a surplus
of £5161. This small surplus was obtained notwithstanding
a further shrinkage in revenue.
Dr Jameson’s programme was largely one of material development. In the words of the speech opening the 1905 session of parliament, “without a considerable development of our agricultural and pastoral resources our position as a self-sustaining colony cannot be assured.” This reliance on its own resources was the more necessary for the Cape because of the keen rivalry of Natal and Delagoa Bay for the carrying trade of the Transvaal. The opening up of backward districts by railways was vigorously pursued, and in other ways great efforts were made to assist agriculture. These efforts to help the country districts met with cordial recognition from the Dutch farmers, and the release, in May 1904, of all rebel prisoners was another step towards reconciliation. On the exclusion of Chinese from the colony the Bond party were also in agreement with the ministry. An education act passed in 1905 established school boards on a popular franchise and provided for the gradual introduction of compulsory education. The cultivation of friendly relations with the neighbouring colonies was also one of the leading objects of Dr Jameson’s policy. The Bond, on its side, sought to draw closer to Het Volk, the Boer organization in the Transvaal, and similar bodies, and at its 1906 congress, held in May at Capetown at a convention in which that aim were secured, the design being to unify, in accordance with the original conception of the Bond, Dutch sentiment and action throughout South Africa.

Native affairs proved a source of considerable anxiety. In January 1905 an inter-colonial native affairs commission reported on the native question as it affected South Africa as a whole, proposals being made for an alteration of the laws in Cape Colony respecting the franchise exercised by natives. In the opinion of the commission the possession of the franchise by the Cape natives under existing conditions was sure to create in time an intolerable situation, and was an unsafe and dangerous thing. (The registration of 1905 showed that there were over 23,000 coloured voters in the colony.) The commission proposed separate voting by natives only for a fixed number of members of the legislature—the plan adopted in New Zealand with the Maori voters. The privileged position of the Cape native was seen to be an obstacle to the federation of South Africa. The discussion which followed, based partly on the reports that the ministry contemplated disfranchising the natives, led, however, to no immediate result. A disturbing factor in connexion with native affairs was the revolt of the Hottentots and Hereros in German South-West Africa (q.v.). In 1904 and the following years large numbers of refugees, including some of the most important chiefs, fled into British territory, and charges were made in Germany that sufficient control over these refugees was not exercised by the Cape government. This trouble, however, came to an end in September 1907. In that month Morenga, a chief who had been interned by the colonial authorities, but had escaped and recommenced hostilities against the Germans, was once more on the British side of the frontier and, refusing to surrender, was pursued by the Cape Mounted Police and killed after a smart action. The revolt in the German protectorate had been, nearly a year before the death of Morenga, the indirect occasion of a “Boer raid” into Cape Colony. In November 1906 a small party of Transvaal Boers, who had been employed by the Germans against the Hottentots, entered the colony under the leadership of a man named Ferreira, and began raiding farms and forcibly enrolling recruits. Within a week the filibusters were all captured. Ferreira and two companions were shot for murder and convicted, February 1907, the death sentences being commuted to terms of penal servitude.

As the result of an inter-colonial conference held in Pietermaritzburg in the early months of 1906, a new customs convention of a strongly protective character came into force on the 1st of June of that year. At the same time the rebate on goods from Great Britain and reciprocating colonies was increased. The session of parliament which sanctioned this change was notable for the attention devoted to irrigation and railway schemes. But one important measure of a political character was passed in 1906, namely an amnesty act. Under its provisions over 7000 ex-rebels, who otherwise would have had no vote at the ensuing general election, were readmitted to the franchise in 1907.

While the efforts made to develop the agricultural and mineral resources of the country proved successful, the towns continued to suffer from the inflation—over-buying, over-building and over-speculation—which marked the war period. As a consequence, imports further declined during 1906–1907, and receipts being largely dependent on customs the result was a considerably diminished revenue. The accounts for the year ending 30th of June 1907 showed a deficit of £640,455. The decline in revenue, £4,400,000 in four years, while not a true reflection of the economic condition of the country—yearly becoming more self-supporting by the increase in home produce—caused general discontent and injuriously affected the position of the ministry. In the session of 1907 the Opposition in the legislative council brought on a crisis by refusing to grant supplies voted by the lower chamber. Dr Jameson contested the constitutional right of the council so to act, and on his advice the governor dissolved parliament in September. Before its dissolution parliament passed an act imposing a profit tax of 10% on diamond- and copper-mining companies, making over £50,000 per annum, and another act establishing an agricultural credit bank.

Mr Merriman Premier.—The elections for the legislative council were held in January 1908 and resulted in a Bond victory. Its supporters, who called themselves the South African party, the Progressives being renamed Unionists, obtained 17 seats out of a total of 26. Dr Jameson thereupon resigned (31st of January), and a ministry was formed with Mr J. X. Merriman as premier and treasurer, and Mr J. W. Sauer as minister of public works. Neither of these politicians was a member of the Bond, and both had held office under Cecil Rhodes and W. P. Schreiner. They had, however, been the leading parliamentary exponents of Bond policy for a considerable time. The elections for the legislative assembly followed in April and, partly in consequence of the re-enfranchisement of the ex-rebels, resulted in a decisive majority for the Merriman ministry.

There were returned 69 members of the South African party, 33 Unionists and 5 Independents, among them the ex-premiers Sir Gordon Sprigg and Mr Schreiner. The change of ministry was not accompanied by any relief in the financial position. While the country districts remained fairly prosperous (agricultural and pastoral products increasing), the transit trade and the urban industries continued to decline. The depression was accentuated by the financial crisis in America, which affected adversely the wool trade, and in a more marked degree the diamond trade, leading to the partial stoppage of the Kimberley mines. (The “slump” in the diamond trade is shown by a comparison of the value of diamonds exported from the Cape in the years 1907 and 1908; in 1907 they were valued at £8,917,148, in 1908 at £4,796,655.) This seriously diminished the revenue returns, and the public accounts for the year 1907–1908 showed a deficit of £966,600, and a prospective deficit for the ensuing year of an almost equal amount. To balance the budget, Mr Merriman proposed drastic remedies, including the suspension of the sinking fund, the reduction of salaries of all civil servants, and taxes on incomes of £50 per annum. Partly in consequence of the serious economic situation the renewed movement for the closer union of the various South African colonies, formally initiated by Dr Jameson in 1904, received the support of the Cape in 1908 and a National convention decided upon unification, and in 1910 the Union of South Africa was established (see SOUTH AFRICA: History).

Leading Personalities.—The public life of Cape Colony has produced many men of singular ability and accomplishments. The careers of Cecil Rhodes, of Jan Hendrik Hofmeyr, and of Dr L. S. Jameson have been sufficiently indicated (see also their separate biographies). Sir Gordon Sprigg, four times premier, was associated with the Cape parliament from 1873 to 1904, and was once more elected to that assembly in 1908. In and out of office his zeal was unflagging, and if he lacked those
qualities which inspire enthusiasm and are requisite in a great leader, he was at least a model of industry. Among other prominent politicians were Sir James Rose-Innes, Mr. J. X. Merriman and Mr. W. P. Schreiner. The two last named both held the premiership; their attitude and views have been indicated in the historical sketch. Sir James Rose-Innes, a lawyer whose intellectual gifts and patriotism have never been impugned, was not a “party man,” and this made him, on more than one occasion, a somewhat difficult political ally. On the native question he held a consistently strong attitude, defending their rights, and uncompromisingly opposing the native liquor traffic. In 1901 he went to the Transvaal as chief justice of that colony. Sir Thomas Fuller, a Cape Town representative, though he remained outside office, gave staunch support to every enlightened liberal and progressive measure which was brought forward. A man of exceptional culture and eloquence, he made his influence felt, not only in politics, but in journalism and the best social life of the Cape peninsula. From 1902 to 1908 he held the office of agent-general of the colony in London.

In literature, the colony has produced at least two authors whose works have taken their place among those of the best English writers of their day. The History of South Africa, by Mr. G. McCall Theal, will remain a classic work of reference. The careful industry and the lucidity which characterize Mr. Theal’s work stamp him as a historian of whom South Africa may well be proud. In fiction, Olive Schreiner’s (Mrs. Crownwright-Schreiner) produced, while still in her teens, the Story of an African Farm, a work which gave great promise of original literary genius. Unfortunately, she, in common with the rest of South Africa, was subsequently swept into the seething vortex of contemporary politics and controversy. In music and painting there have been artists of talent in the Cape Colony, but the country is still too young, and the conditions of life too disturbed, to allow such a development as has already occurred in Australia.

GOVERNORS AT THE CAPE SINCE INTRODUCTION OF RESPONSIBLE GOVERNMENT

1870. Sir Henry barkly.
1877. Sir Bartle Frere.
1878. Sir Harry Robinson.
1889. Sir Harry Loch.
1895. Sir Harry Robinson (Lord Rosmead).
1897. Sir Alfred Milner.
1901. Sir Walter Hely-Hutchinson.

PRIME MINISTERS

1872. Mr. J. C. Molteno.
1875. Mr. J. Gordon Sprigg.
1877. Mr. R. W. Paton.
1884. Mr. Upington.
1886. Sir J. Gordon Sprigg.
1890. Mr. C. J. Rhodes.
1896. Sir J. Gordon Sprigg.
1898. Mr. W. P. Schreiner.
1900. Sir J. Gordon Sprigg.
1904. Dr. L. S. Jameson.
1905. Sir Harry Gordon.
1907. Mr. J. X. Merriman.

ADEMBU:

BIBLIOGRAPHY—The majority of the books concerning Cape Colony deal also with South Africa as a whole (see South Africa: Bibliography). The following list gives books specially relating to the Cape. For bibliography see the works mentioned under Bushmen, Hottentots, Kaffirs and Bechuana.

(a) Descriptive accounts, geography, commerce and economics. The best early accounts of the colony are found in de la Caille’s Journal historique du voyage fait au Cap de Bonne Espérance (Paris, 1763), the Nouvelle Description du Cap de Bonne Espérance (Amsterdam, 1668); F. le Vaillant’s Voyage dans l’Intérieur de l’Afrique (Paris, 1790), and Second Voyage (Paris, an III. 1794–1795); C. P. Thunberg’s “Account of the Cape of Good Hope” in vol. xvi. of Pinkerton’s Travels (London, 1814): A. Sparrman’s Voyage to the Cape of Good Hope (trans. into English from the Swedish, London, 1785)—an excellent work; and W. Paterson’s A Narrative of Four Journeys ... 1777–1779 (London, 1789).

P. Kolbe or Kolben’s Present State of the Cape of Good Hope (English translation from the German, London, 1731) is less trustworthy. Sir John Barrow’s Narrative of a Tour into Southern Africa in 1797–1798 (2 vols., London, 1801–1804); H. Lichtenstein’s Travels in Southern Africa in 1803–1806 (translated from the German, 2 vols., London, 1812–1815), and W. J. Burchell’s Travels in the Interior of Southern Africa (2 vols., London, 1822–1824) are standard works. Burchell’s book contains the best map of the Cape published up to that time. W. P. Gesnwell’s Geography of Africa south of the Zambesi (Oxford, 1895) deals specially with Cape Colony; the Illustrated Official Handbook of the Cape and South Africa (Cape Town, 1893) includes chapters on the zoology, flora, productions and resources of the colony. A. R. Burton, Cape Colony To-day (Cape Town, 1907), a useful guide to the country and its resources. A Statistical Register is issued yearly by the Cape government. The Census of the Colony, 1904: General Report (Cape Town, 1905) and previous censuses reports contain much valuable matter.

(c) History. H. C. L. Leithbrandt, Precis of the Archives of the Cape of Good Hope (15 vols., v. vii. contain van Riebeck’s Journal, Cape Town, 1866–1902); The Rebellion of 1815, generally known as Slatter’s Nek (Cape Town, 1902); G. M. Theal, Chronicles of Cape Commanders ... 1517–1607 ... (Cape Town, 1882), and Records, Historical, Vol. I, from the Colony’s First Mas, in the Record Office, London (36 vols., Cape Town, 1897–1905); History of South Africa under the Administration of the Dutch East India Company, 1652 to 1795 (2 vols., London, 1897); History of South Africa under the British East India Company, 1795 to 1820 (London, 1897); History of South Africa under the British East India Company, 1820 to 1877 (London, 1905); E. C. H Aston, Three Lectures on the Cape under the Dutch East India Company (Cape Town, 1857); A. Wilmot and J. C. Chase, History of the ... Cape from its Discovery to ... 1805 (Cape Town, 1899); Lady Anne Barnard, South Africa a Hundred Years Ago: Letters from the Cape, 1797–1801 (London, 1901), a vivid picture of social life, &c.; Mrs. A. F. Trotter, Old Cape Colony ... Her Men and Houses from 1652 to 1860 (London, 1903); C. T. Campbell, British South Africa, 1705–1852 (London, 1897), the story of the British settlers in South Africa; “The Life of Sir Bartle Frere,” in the papers, London, 1905); A. Wilmot’s Life of Sir Richard Burton (London, 1900); E. C. H. Aston, The History of Sir Richard Burton (London, 1907). W. Borsford’s Life of Sir Richard Burton (London, 1906), largely concerned with Cape politics. For Blue-books, &c., relating to the colony published by the British parliament, see the Colonial Office List, yearly.

CAPEFIGUE, JEAN-BAPTISTE HONORÉ RAYMOND (1801–1872), French historian and biographer, was born at Marseilles in 1801. At the age of twenty he went to Paris to study law; but giving up his law profession he became a journalist. He became editor of the Quotidiene, and was afterwards connected, either as editor or leading contributor, with the Temps, the Mercure des Chambres, the Révolution de 1848 and other papers. During the ascendancy of the Bourbons he held a post in the foreign office, to which is due the royalism of some of his newspaper articles. Indeed all Capefigue’s works receive their colour from his legitimist politics; he preaches divine right and non-resistance, and finds polite words even for the profanity of Louis XV. and the worthless of his mistresses. He wrote biographies of Catherine and Marie de’ Medici, Anne and Maria Theresa of Austria, Catherine II. of Russia, Elizabeth of England, Diana of Poitiers and Agnes Sorel—for he delighted in passing from “queens of the right hand” to “queens of the left.” His historical works, besides histories of the Jews from the fall of the Maccabees to the author’s time, of the first four centuries of the Christian church, and of European diplomats, extend over the whole range of French history. He died at Paris in December 1872.

The general catalogue of printed books for the Bibliothèque Nationale contains no fewer than seventy-seven works (145 volumes) published by Capefigue. Among the best of his books are the Histoire de Philippe-Auguste (4 vols., 1829) and the Histoire de la réforme, de la ligue et du regne de Henri IV (8 vols., 1834–1835) perhaps deserve still to be remembered. For Capefigue’s style bear evident marks of haste, and although he had access to an exceptionally large number of sources of information, including state papers, neither his accuracy nor his judgment was to be trusted.

CAPEL (OR HADHAM), ARTHUR CAPEL, BARKER (fl. 1642–1649), English royalist, son of Sir Henry Capel of Rayne Hall,
Essex, and of Theodosia, daughter of Sir Edward Montagu of Broughton, Northampshorne, was elected a member of the Short and Long Parliaments in 1642 for Hertfordshire. He at first supported the opposition to Charles's arbitrary government, but soon allied himself with the king's cause, on which side his sympathies were engaged, and was raised to the peerage by the title of Baron Capel of Hadham on the 6th of August 1642. On the outbreak of the war he was appointed lieutenant-general of Shropshire, Cheshire and North Wales, where he rendered useful military services, and later was made one of the prince of Wales's councillors, and a commissioner at the negotiations at Uxbridge in 1645. He attended the queen in her flight to France in 1646, but disapproved of the prince's journey thither, and retired to Jersey, subsequently aiding in the king's escape to the Isle of Wight. He was one of the chief leaders in the second Civil War, but met with no success, and on the 27th of August, together with Lord Norwich, he surrendered to Fairfax at Colchester on promise of quarter for life. This assurance, however, was afterwards interpreted as not binding the civil authorities, and his fate for some time hung in the balance. He succeeded in escaping from the Tower, but was again captured, was condemned to death by the new "high court of justice" on the 8th of March 1649, and was beheaded together with the duke of Hamilton and Lord Holland the next day. He married Elizabeth, daughter and heir of Sir Charles Morrison of Cassiobury, Hertfordshire, through whom that estate passed into his family, and by whom besides four daughters he had five sons, the eldest Arthur being created earl of Essex at the Restoration. Lord Capel, who was much beloved, and who was a man of deep religious feeling and exemplary life, wrote Daily Observations or Meditations: Divine, Morall, published with some of his letters in 1654, and reprinted, with a short life of the author, under the title Excellent Contemplations, in 1683.

CAPEL, EDWARD (1713-1781), English Shakespearian critic, was born at Troston Hall in Suffolk on the 11th of June 1713. Through the influence of the duke of Grafton he was appointed to the office of deputy-inspector of plays in 1737, with a salary of £200 per annum, and in 1745 he was made grooms of the privy chamber through the same influence. In 1760 appeared his Prologus, or Select Pieces of Ancient Poetry, a collection which included Edward III., placed by Capell among the doubtful plays of Shakspeare. Shocked at the inaccuracy which had crept into Sir Thomas Hanmer's edition of Shakespeare, he projected an entirely new edition, to be carefully collated with the original copies. After spending three years in collecting, and comparing scarce folio and quarto editions, he published his own edition in 10 vols. 8vo (1768), with an introduction written in a style of extraordinary quaintness, which was afterwards appended to Johnson's and Steevens's editions. Capell published the first part of his commentary, which included notes on nine plays with a glossary, in 1774. This he afterwards recalled, and the publication of the complete work, Notes and Various Readings of Shakespeare (1770-1783), the third volume of which bears the title of The School of Shakespeare, was completed, under the superintendence of John Collins, in 1783, two years after the author's death. It contains the results of his unremitting labour for thirty years, and throws considerable light on the history of the times of Shakespeare, as well as on the sources from which he derived his plots. Collins asserted that Steevens had stolen Capell's notes for his own edition, the story being that the printers had been bribed to show Steevens the sheets of Capell's edition while it was passing through the press. Besides the works already specified, he published an edition of Antony and Cleopatra, adapted for the stage with the help of David Garrick in 1758. His edition of Shakespeare passed through many editions (1768, 1771, 1793, 1799, 1803, 1813). Capell died in the Temple on the 24th of February 1781.

CAPELLA, MARTIANUS MINNEUS FELIX, Latin writer, according to Cassiodorus a native of Madaura in Africa, flourished during the 5th century, certainly before the year 430. He appears to have practised as a lawyer at Carthage and to have been in easy circumstances. His curious encyclopaedic work, entitled Satyricon, or De Nuptiis Philologiae et Mercuri, is an elaborate allegory in nine books, written in a mixture of prose and verse, after the manner of the Metamorphoses. Its style is heavy and involved, loaded with metaphor and bizarre expressions, and verbose to excess. The first two books contain the allegory proper—the marriage of Mercury to a nymph named Philologia. The remaining seven books contain expositions of the seven liberal arts, which then comprehended all human knowledge. Book iii. treats of grammar, ii. of dialectics, v. of rhetoric, vi. of geometry, vii. of arithmetic, viii. of astronomy, ix. of music. These abstract discussions are linked on to the original allegory by the device of personifying each science as a courtier of Mercury and Philologia. The work was a complete encyclopaedia of the liberal culture of the time, and was in high repute during the middle ages. The author's chief sources were Varro, Pliny, Solinus, Aquila Romanus, and Ariostes Quintilius. His prose resembles that of Apuleius (also a native of Madaura), but is even more difficult. The verse portions, which are on the whole correct and classically constructed, are in imitation of Varro and are less ancient.

Passage in book viii. contains a very clear statement of the heliocentric system of astronomy. It has been supposed that Copernicus, who quotes Capella, may have received from this work some hints towards his own new system.

Editio princeps, by F. Vitalis Bodianus, 1499; the best modern edition is that of F. Eysenhardt (1866); for the relation of Martianus Capella to Ariostes Quintilius see H. Deiters, Studien zu den griechischen Musken (1881). In the 11th century the German monk Notker Labeo translated the first two books into Old High German.

CAPE MAY, a city and watering-place of Cape May county, New Jersey, U.S.A., on the Atlantic coast, 2 m. E.N.E. of Cape May, the S. extremity of the state, and about 80 m. S. by E. of Philadelphia. Pop. (1890) 2136; (1900) 2257; (1910) 3006; (1910) 2471. Cape May is served by the Maryland, Delaware & Virginia (by ferry to Lewes, Delaware), the West Jersey & Seashore (Pennsylvania system), and the Atlantic City (Reading system) railways, and, during the summer, by Steamer Atlanta to Philadelphia. The principal part of the city is on a peninsula (formerly Cape Island) between the ocean and Cold Spring Inlet, which has been dredged and is protected by jetties to make a suitable harbour. The further improvement of the inlet and the harbour was authorized by Congress in 1907. On the ocean side, along a hard sand beach 5 m. long, is the Esplanade. There are numerous hotels and handsome cottages for summer visitors, who come especially from Philadelphia, from New York, from the South and from the West. Cape May offers good bathing, yachting and fishing, with driving and hunting in the wooded country inland from the coast. At Cape May Point is the Cape May Lighthouse, 145 ft. high, built in 1800 and rebuilt in 1859. In the city are canneries of vegetables and fruit, glass-works and a gold-beating establishment. Fish and oysters are exported. Cape May was named by Cornelis Jacobsen Mey, director of the Prince Hendrick (Delaware) river for the West India Company of

1 Gardiner's Hist. of the Civil War. iv. 206; cf. article on Fairfax by C. H. Frith in the Dict. of Nat. Biog.
CAPENA—CAPERCALLY

Holland, who took possession of the river in 1623, and planted the short-lived colony of Fort Nassau 4 m. below Philadelphia, near the present Gloucester City, N.J. Cape May was settled about 1669, —a previous attempt to settle here made by Samuel Blommaert in 1631 was unsuccessful. It was an important whaling port early in the 18th century, and became prominent as a watering-place late in that century. It was incorporated as the borough of Cape Island in 1848, and chartered as the city of Cape Island in 1851; in 1869 the name was changed to Cape May.

CAPENA, an ancient city of southern Etruria, frequently mentioned with Veii and Falerii. Its exact site is, however, uncertain. According to Cato it was a colony of the former, and in the wars between Veii and Rome it appears as dependent upon Veii, after the fall of which town, however, it became subject to Rome. Out of its territory the tribus Stellatina was formed in 367 B.C. In later republican times the city itself is hardly mentioned, but under the empire a municipium Capenatium foederatum is frequently mentioned in inscriptions. Of these several were found upon the hill known as Civitucola, about 4 m. north-east of the post station of ad Viciissimum on the ancient Via Flaminia, a site which is well adapted for an ancient city. It lies on the north side of a dried-up lake, once no doubt a volcanic crater. Remains of buildings of the Roman period also exist there, while, in the sides of the hill of S. Martino which lies on the north-east, rock-cut tombs belonging to the 7th and 6th centuries B.C. but used in Roman times for fresh burials, were excavated in 1850-1864, and again in 1904. Inscriptions in early Latin and in local dialect were also found (W. Henzen, Bullettino dell' Istituto, 1864, 143; R. Paribeni, Notizie degli Scavi, 1905, 301). Similar tombs have also been found on the hills south of Civitucola. G. B. de Rossi, however, supposed that the games of which records (fragments of the fasti lidorum) were also discovered at Civitucola, were those which were celebrated from time immemorial at the Lukus Feroniae, with which he therefore proposed to identify this place, placing Capena itself at S. Oreste, on the south-eastern side of Mount Soracte. But there are difficulties in the way of this assumption. It is more probable that the Lukus Feroniae was sought at or near Nazzano, where, in the excavation of a circular building which some conjecture to have been the actual temple of Feronia, inscriptions relating to a municipality were found. Others, however, propose to place Lukus Feroniae at the church of S. Abbondio, 1 m. east of Rignano and 4 m. north north-west of Civitucola, which is built out of ancient materials. On the Via Flaminia, 26 m. from Rome, near Rignano, is the Christian cemetery of Theodora.

See R. Lanciani, Bullettino dell' Istituto, 1870, 32; G. B. de Rossi, Annali dell' Istituto, 1883, 254; Bullettino Cristiano, 1883, 115; G. Dennis, Cities and Cemeteries of Etruria (London, 1883), i. 131; E. H. Pliny, Corpus Inscriptionum Latinarum (Berlin, 1888) s. v. 571; H. Nissen, Italiche Landeskunde (Berlin, 1902), ii. 359; R. Paribeni, in Monumenti dei Lincei, xvi. (1906), 277 seq. (T. As.)

CAPER, FLAVIU, Latin grammarians, flourished during the 2nd century. He devoted special attention to the early Latin writers, and is highly spoken of by普iscian. Caper was the author of two works—De Lingua Latina and De Dubiis Generibus. These works in their original form are lost; but two short treatises entitled De Orthographia and De Verbis Dubiis have come down to us under his name, probably excerpts from the original works, with later additions by an unknown writer.

See F. Osann, De Flavio Cepro (1849), and review by W. Christ in Philologia (1863), i. 133. The most recent and important grammarians are noticed; G. Keil, De Flavio Grammatico, in Dissertatones Halenses, x. (1889); text in H. Keil's Grammatici Latinii, vii.

CAPERCALLY, or Caperkally, a bird's name commonly derived from the Gaelic capull, a horse (or, more properly, a

1 Some writers wrongly speak as though the two hills were identical.

2 This is the spelling of the old law-books, as given by Pennant, the zoologist, who, on something more than mere report, first included this bird among the British fauna. The only one of the "Scots Acts," however, in which the present writer has been able to ascertain that the bird is named is No. 30 of James VI. (1621), which was passed to protect "pawtie, partricks, moore foules, blakocks, gray hennis, termigants, quailies, capercasities," &c.

3 Not to be confounded with the bird so named previously by Prof. Nilsson, which is a hybrid.
of the law, for the so-called sportsman stealthily to draw nigh, and with well-armed gun to murder the principal performer in the scene. The hen makes an artless nest on the ground, and lays therein from seven to nine or even more eggs. The young are able to fly soon after they are hatched, and towards the end of summer and beginning of autumn, from feeding on the fruit and leaves of the bilberries and other similar plants, which form the undercovert of the forests, get into excellent condition and become good eating. With the first heavy falls of snow they betake themselves to the trees, and then, feeding on the pine-leaves, their flesh speedily acquires so strong a flavour of turpentine as to be distasteful to most palates. The usual method of pursuing this species on the continent of Europe is by encouraging a trained dog to range the forest and spring the birds, which then perch on the trees; while he is baying at the foot their attention is so much attracted by him that they permit the near approach of his master, who thus obtains a more or less easy shot. A considerable number, however, are also snared. Hybrids are very frequently produced between the capercally and the black grouse (T. tetrix), and the offspring has been described by some authors under the name of T. medius, as though a distinct species.

CAPERN, EDWARD (1819-1894), English poet, was born at Tiverton, Devonshire, on the 21st of January 1819. From an early age he worked in a lace factory, but owing to failing eyesight he had to abandon this occupation in 1847 and he was in dire distress until he secured an appointment to be "the Rural Postman of Bideford," by which name he is usually known. He occupied his leisure in writing occasional poetry which struck the popular fancy. Collected in a volume and published by subscription in 1856, it received the warm praise of the reviewers and many distinguished people. Poems, by Edward Capern, was followed by Ballads and Songs (1858), The Devonshire Melodist (a collection of the author's songs, some of them to his own music) and Wayside Warbles (1865), and resulted in a civil list pension being granted him by Lord Palmerston. He died on the 4th of June 1894.

CAPERNAUM (Καπερναοῦμ; probably, "the village of Naùnum"), an ancient city of Galilee. More than any other place, it was the home of Jesus after he began his mission; there he preached, there he taught, there he worked miracles, yet without meeting with much response from the inhabitants, over whom he pronounced the heavy denunciation:—"And thou, Capernaum, which art exalted unto heaven, shalt be brought down to hell." The site of the city has been a matter of much dispute,—one party, headed by Dr E. Robinson, maintaining an identification with Khan Minyeh at the north-west corner of the Sea of Galilee, and another, represented especially by Sir C. W. Wilson, supporting the claims of Tell Hum, midway between Khan Minyeh and the mouth of the Jordan. Khan Minyeh is beautifully situated in a "fertile plain formed by the retreat of the mountains about the middle of the western shore" of the Sea of Galilee. Its ruins are not very extensive, though they may have been despoiled for building the great Saracenic Khan from which they take their name. In the neighbourhood is a watersource, Ain et-Tahbighah, an Arabic corruption of Hepatpegon or Seven Springs (referred to by Josephus as being near Capernaum). Tell Hum lies about 3 m. north of Khan Minyeh, and its ruins, covering an area of "half a mile long by a quarter wide," prove it to have been the site of the town itself. It must be admitted that if it be not Capernaum it is impossible to say what ancient place it represents. But it is doubtful whether Tell Hum can be considered as a corruption of Kofer Naùnum, the Semitic name which the Greek represents: and there is not here, as at Khan Minyeh, any spring that can be equated to the Hepatpegon of Josephus. On the whole the probabilities of the two sites seem to balance, and it is practically impossible without further discoveries to decide between them. The sites of the neighbouring cities of Bethsaida and Chorazin are probably to be sought respectively at El-Bateh, a grassy plain in the north-east corner of the lake, and at Keraze, 2 m. north of Tell Hum. According to the so-called Pseudo-Methodius there was a tradition that Antichrist would be born at Chorazin, educated at Bethsaida and rule at Capernaum—hence the curse of Jesus upon these cities.

CAPERS, the unexpanded flower-buds of Capparis spinosa, prepared with vinegar for use as a pickle. The caper plant is a trailing shrub, belonging to the Mediterranean region, resembling in habit the common bramble, and having handsome flowers of a pinkish white, with four petals, and numerous long tassel-like stamens. The leaves are simple and ovate, with spiny stipules. The plant is cultivated in Sicily and the south of France; and in commerce capers are valued according to the period at which the buds are gathered and preserved. The finest are the young tender buds called "nonpareil," after which, gradually increasing in size and lessening in value, come "superfine," "fine," "capucin" and "capot." Other species of Capparis are similarly employed in various localities, and in some cases the fruit is pickled.

CAPET, the name of a family to which, for nearly nine centuries, the kings of France, and many of the rulers of the most powerful dominion that country, belonged, and which mingled with several of the other royal races of Europe. The origin of the name remains in dispute, but the first of the family to whom it was applied was Hugh, who was elected king of the Franks in 987. The real founder of the house, however, was Robert the Strong (q.v.), who received from Charles the Bald, king of the Franks, the countships of Anjou and Blois, and who is sometimes called duke, as he exercised some military authority in the district between the Seine and the Loire. According to Aimoin of Saint-Germain-des-Prés, and the chronicle, Richer, he was a Saxon, but historians question this statement. Robert's two sons, Odo or Eudes, and Robert II., succeeded their father successively as dukes, and, in 887, some of the Franks chose Odo as their king. A similar step was taken, in 922, in the case of Robert II., this too marking the increasing irritation felt at the weakness of the Carolingian kings. When Robert died in 923, he was succeeded by his brother-in-law, Rudolph, duke of Burgundy, and not by his son Hugh, who is known in history as Hugh the Great, duke of France and Burgundy, and whose domain extended from the Loire to the frontiers of Picardy. When Louis V., king of the Franks, died in 987, the Tancred, son of the great Tancred, passed over his brother Charles, and elected Hugh Capet, son of Hugh the Great, as their king, and crowned him at Reims. Avoiding the pretensions which had been made by the Carolingian kings, the Capetian kings were content, for a time, with a more modest position, and the story of the growth of their power belongs to the history of France. They had to combat the feudal nobility, and later, the younger branches of the royal house established in the great duchies, and the main reason for the permanence of their power was, perhaps, the fact that there were few minorities among them. The direct line ruled in France from 987 to 1328, when, at the death of King Charles IV., it was succeeded by the younger, or Valois, branch of the family. Philip VI., the first of the Valois kings, was a son of Charles I., count of Valois and grandson of King Philip III. (see VALOIS). The Capetian-Valois dynasty lasted until 1498, when Louis, duke of Orleans, became king as Louis XII., on the death of King Charles VIII. (see Orleans). Louis XII., dying childless, the house of Valois-Angoulême followed from Francis I. to the death of Henry III. in 1589 (see ANGOULÊME), when the last great Capetian family, the Bourbons (q.v.), mounted the throne.

Scarcely second to the royal house is the branch to which belonged the dukes of Burgundy. In the 10th century the duchy of Burgundy fell into the hands of Hugh the Great, father of Hugh Capet, on whose death in 956 it passed to his son Otto, and, in 962, to his son Henry. In 1032, Robert, second son of Robert the Pious, king of the Franks, and grandson of Hugh Capet, founded the first ducal house, which ruled until 1361. For two years the duchy was in the hands of the crown, but in 1363, the second ducal house, also Capetian, was founded by Philip the Bold, son of John II., king of France. This branch
CAPE TOWN

of the Capetians is also distinguished by its union with the Habsburgs, through the marriage of Mary, daughter of Charles the Bold, duke of Burgundy, with Maximilian, afterwards the emperor Maximilian I. Of great importance also was the house of the counts of Anjou, which was founded in 1246, by Charles, son of the French king Louis VIII., and which, in 1360, was raised to the dignity of a duchedom (see Anjou). Members of this family sat upon the thrones of two kingdoms. The counts and dukes of Anjou were kings of Naples from 1265 to 1442.

In 1308 Charles Robert of Anjou was elected king of Hungary, his claim being based on the marriage of his grandfather Charles II., king of Naples and count of Anjou, with Maria, daughter of Stephen V., king of Hungary. A third branch formed the house of the counts of Artois, which was founded in 1238 by Robert, son of King Louis VIII. This house merged in that of Valois in 1383, by the marriage of Margaret, daughter of Louis, count of Artois, with Philip the Bold, duke of Burgundy. The throne of Navarre was also filled by the Capetians. In 1284 Jeanne, daughter and heiress of Henry I., king of Navarre, married Philip IV., king of France, and the two kingdoms were united until Philip of Valois became king of France as Philip VI. in 1380, when Jeanne's daughter, of King Louis X., and heiress of Navarre, married Philip, count of Evreux (see Navarre).

In the 13th century the throne of Constantinople was occupied by a branch of the Capetians. Peter, grandson of King Louis VI., obtained that dignity in 1217 as brother-in-law of the two previous emperors, Baldwin, count of Flanders, and his brother Henry. Peter was succeeded successively by his two sons, Robert and Baldwin, from whom in 1261 the empire was recovered by the Greeks.

The counts of Dreux, for two centuries and a half (1132–1377), and the counts of Evreux, from 1307 to 1425, also belonged to the family of the Capets.—other members of which worthy of mention are the Dunois and the Longuevilles, illegitimate branches of the house of Valois, which produced many famous warriors and courtiers.

CAPE TOWN, the capital of the Cape Province, South Africa, in 33° 56' S., 18° 28' E. It is at the north-west extremity of the Cape Peninsula on the south shore of Table Bay, is 6181 m. by sea from London and 977 by rail south-west of Johannesburg. Few cities are more magnificently situated. Behind the bay the massive wall of Table Mountain, 2 m. in length, rises to a height of over 3500 ft., while on the east and west projecting mountains enclose the plain in which the city lies. The mountain to the east, 3300 ft. high, which projects but slightly seawards, is the Devil's Peak, that to the west the Lion's Head (over 2000 ft. high), with a lesser height in front called the Lion's Rump or Signal Hill. The city, at first confined to the land at the head of the bay, has extended all round the shores of the bay and to the lower spurs of Table Mountain.

The purely Dutch aspect which Cape Town preserved until the middle of the 19th century has disappeared. Nearly all the stucco-fronted brick houses, with flat roofs and cornices and wide spreading stoeps, of the early Dutch settlers have been replaced by shops, warehouses and offices in styles common to English towns. Of the many fine public buildings which adorn the city scarcely any date before 1860. The mixture of races among the inhabitants, especially the presence of numerous Malays, who on all festive occasions appear in gorgeous raiment, gives additional animation and colour to the street scenes. The mosques with their cupolas and minarets, and houses built in Eastern fashion contrast curiously with the Renaissance style of most of the modern buildings, the medieval aspect of the castle and the quaint appearance of the Dutch houses still standing.

Chief Public Buildings.—The castle stands near the shore at the head of the bay. Begun in 1666 its usefulness as a fortress has long ceased, but it serves to link the city to its past. West of the castle is a large oblong space, the Parade Ground. A little farther west, at the foot of the central jetty is a statue of Van Riebeeck, the first governor of the Cape. In a line with the jetty is Adderley Street, and its continuation Government Avenue. Adderley Street and the avenue make one straight road a mile long, and at its end are "the Gardens," as the suburbs built on the rising ground leading to Table Mountain are called. The avenue itself is fully half a mile long and is lined on either side with fine oak trees. In Adderley Street are the customs house and railway station, the Standard bank, the general post and telegraph offices, with a tower 120 ft. high, and the Dutch Reformed church. The church dates from 1609 and is the oldest church in South Africa. Of the original building only the clock tower (sent from Holland in 1727) remains. Government Avenue contains, on the east side, the Houses of Parliament, government house, a modernized Dutch building, and the Jewish synagogue; on the west side are the Anglican cathedral and grammar schools, the public library, botanic gardens, the museum and South African college. Many of these buildings are of considerable architectural merit, the material chiefly used in their construction being granite from the Paarl and red brick. The botanic gardens cover 14 acres, contain over 8000 varieties of trees and plants, and afford a magnificent view of Table Mountain and its companion heights. In the gardens, in front of government house is a statue of Sir George Grey, governor of the Cape from 1854 to 1861. The most valuable portion of the library is the 5000 volumes presented by Sir George Grey. In Queen Victoria Street, which runs along the west side of the gardens, are the Cape University buildings (begun in 1896), the law courts, City club and Huguenot memorial hall. The Anglican cathedral, begun in 1901 to replace an unpretentious building on the same site, is dedicated to St. George. It lies between the library and St. George's Street, in which are the chief newspaper offices, and premises of the wholesale merchants. West of St. George's Street is Greenmarket Square, the centre of the town during the Dutch period. From the balcony of the town house, which overlooks the square, proclamations were read to the burghers, summoned to the spot by the ringing of the bell in the small-domed tower. Still farther west, in Riebeek Square, is the old slave market, now used as a church and school for coloured people.

Facing the north side of the Parade Ground are the handsome municipal buildings, completed in 1906. The most conspicuous feature is the clock tower and belfry, 200 ft. high. The hall is 130 ft. by 62, and 55 ft. high. Opposite the main entrance is a statue of Edward VII. by William Goscombe John, unveiled in 1905. The opera house occupies the north-west corner of the Parade Ground. Plein Street, which leads south from the Parade Ground, is noted for its cheap shops, largely patronized on Saturday nights by the coloured inhabitants. In Sir Lowry Road, the chief eastern thoroughfare, is the large vegetable and fruit market. Immediately west of the harbour are the convict station and Somerset hospital. They are built at the town end of Greenpoint Common, the open space at the foot of Signal Hill. Cape Town is provided with an excellent water supply and an efficient drainage system.

The Suburbs.—The suburbs of Cape Town, for natural beauty of position, are among the finest in the world. On the west they extend about 3 m., by Green Point to Sea Point, between the sea and the foot of the Lion's Rump; on the east they run round the Devil's Peak, by Woodstock, Mitchell's plain and Bishop's, to Newlands, Claremont &c., a distance of 7 m. Though these are managed by various municipalities, there is practically no break in the buildings for the whole distance. All the parts are connected by the suburban railway service, and by an electric tramway system. A tramway also runs from the town over the Kloof, or pass between Table Mountain and the Lion's Head, to Camp's Bay, on the west coast south of Sea Point, to which place it is continued, the tramway thus completely circling the Lion's Head and Signal Hill. Of the suburbs mentioned, Green Point and Sea Point are seaside resorts, Woodstock being both a business and residential quarter. Woodstock covers the ground on which the British, in 1866, defeated the Dutch, and contains the house in which the articles of capitulation were signed. Another seaside suburb is Milnerton on the north-east shores of Table Bay at the mouth of the Diep river. Near Maitland, and 3 m. from the city, is the Cape Town observatory, built in
CAPE VERDE ISLANDS

The Cape Verde Islands (Ilhas do Cabo Verde), an archipelago belonging to Portugal, off the West African coast, between 17° 13' and 14° 47' N. and 22° 40' and 25° 22' W. Pop. (1905) 33,000; area, 1,475 sq. m. The archipelago consists of ten islands:—Santo Antão (commonly miswritten St Antonio), São Vicente, Santa Luzia, São Nicolau, Sal, Boa Vista, Maio, São Thiago (the St Jago of the English), Fogo, and Brava, besides four uninhabited islets. It forms a sort of broken crescent, with the concavity towards the west. The last four islands constitute the leeward (Sotavento) group and the other six the windward (Barlavento). The distance between the coast of Africa and the nearest island (Boa Vista) is about 300 m. The islands derive their name, frequently but erroneously written "Cape Verd," or "Cape de Verdad" Islands, from the African promontory off which they lie, known as Cape Verde, or the Green Cape. The entire archipelago is of volcanic origin, and on the island of Fogo there is an active volcano. No serious eruption has taken place since 1650, and the craters from which the streams of basalt issued have lost their outline.

Inhabitants of the city proper 44,203 were white (1904). Of the coloured inhabitants 6,651 were Malays; the remainder being chiefly of mixed blood. The most populous suburbs in 1904 were Woodstock with 28,000 inhabitants, and Wynberg with 18,477.

History and Local Government.—Cape Town was founded in 1652 by settlers sent from Holland by the Netherlands East India Co., under Jan van Riebeeck. It came definitely into the possession of Great Britain in 1806. Its political history is indistinguishable from that of Cape Colony (q.v.). The town was granted municipal institutions in 1836. (Among the councillors returned at the election of 1904 was Dr Abdurrahman, a Mahomedan and a graduate of Edinburgh, this being, it is believed, the first instance of the election of a man of colour to any European representative body in South Africa.) The municipality owns the water and lighting services. The municipal rating value was, in 1880 £2,054,204, in 1901 £4,475,260, in 1908 (when the rate levied was 3d. in the £) £14,129,430. The total rateable value of the suburbs, not included in the above figures, is over £8,000,000. Rates are based on capital, not annual, value. The control of the port is vested in the Harbour and Railway Board of the Union.

Cape Town is the seat of the legislature of the Union of South Africa, of the provincial government, of the provincial division of the Supreme Court of South Africa, and of the Cape University; also of an archbishop of the Anglican and a bishop of the Roman Catholic churches.

1820 and maintained by the British government. Rondebosch, 5 m. from the city, contains some of the finest of the Dutch mansions in South Africa. Less than a mile from the station is Groote Schuur, a typical specimen of the country houses built by the Dutch settlers in the 17th century. The house was the property of Cecil Rhodes, and was bequeathed by him for the use of the prime minister of Federated South Africa. The grounds of the estate extend up the slopes of Table Mountain. At Newlands is Bishop's Court, the home of the archbishop of Cape Town. More distant suburbs to the south-east are Constantia, with a famous Dutch farm-house and wine farm, and Muizenberg and Kalk Bay, the two last villages on the shore of False Bay. At Muizenberg Cecil Rhodes died, 1902. Facing the Atlantic is Hout's Bay, 10 m. south-west of Wynberg. Most of the suburbs and the city itself are exposed to the south-east winds which, passing over the flats which join the Cape Peninsula to the mainland, reach the city sand-laden. From its bracing qualities this wind, which blows in the summer, is known as the "Cape Doctor." During its prevalence Table Mountain is covered by a dense whitish-grey cloud, overlapping its side like a tablecloth.

The Harbour.—Table Bay, 20 m. wide at its entrance, is fully exposed to north and north-west gales. The harbour works, begun in 1860, afford sheltered accommodation for a large number of vessels. From the west end of the bay a breakwater extends north-east for some 4,000 ft. East of the breakwater and parallel to it for 2,700 ft. is the South pier. From breakwater and pier arms project laterally. In the area enclosed are the Victoria basin, covering 64 acres, the Alfred basin of 82 acres, a graving dock 520 ft. long and a patent slip for vessels up to 1,500 tons. There is good anchorage outside the Victoria basin under the lee of the breakwater, and since 1904 the foreshore east of the south pier has been reclaimed and additional wharfage provided. Altogether there are 21 m. of quay walls, the wharfs being provided with electrical craneage. Cargo can be transferred direct from the ship into railway trucks. Vessels of the deepest draught can enter into the Victoria basin, the depth of water at low tide ranging from 24 to 36 ft.

Trade and Communication.—The port has a practical monopoly of the passenger traffic between the Cape and England. Several lines of steamers—chiefly British and German—maintain regular communication with Europe, the British mail boats taking sixteen days on the journey. By its railway connexions Cape Town affords the quickest means of reaching, from western Europe, every other town in South Africa. In the import trade Cape Town is closely rivalled by Port Elizabeth, but its export trade, which includes diamonds and bar gold, is fully 70% of that of the entire colony. In 1888, the year before the beginning of the Anglo-Boer war, the volume of trade was:—Imports £5,128,292, exports £15,881,052. In 1904, two years after the conclusion of the war the figures were:—imports £9,070,757; exports £17,471,760. In 1907 during a period of severe and prolonged trade depression the imports had fallen to £5,263,930, but the exports owing entirely to the increased output of gold from the Rand mines had increased to £37,994,658; gold and diamonds represented over £17,000,000 of this total. The tonnage of ships entering the harbour in 1889 was 801,033. In 1904 it had risen to 4,846,012 and in 1907 was 4,671,146. The trade of the port in tons was 1,276,330 in 1899 and 1,413,471 in 1904. In 1907 it had fallen to 658,721.

Defence.—Cape Town, being in the event of the closing of the Suez Canal on the main route of ships from Europe to the East, is of considerable strategic importance. It is defended by several batteries armed with modern heavy guns. It is garrisoned by Imperial and local troops, and is connected by railway with the naval station at Simon's Town on the east of the Cape Peninsula.

Population.—The Cape electoral division, which includes Cape Town, had in 1865 a population of 50,064, in 1875 57,310, in 1891 97,238, and in 1904 213,167, of whom 120,475 were whites. Cape Town itself had a population in 1875 of 33,000, in 1891 of 51,251, and in 1904 of 77,008. Inclusive of the nearer suburbs the population was 78,866 in 1891 and 170,083 in 1904. Of the
Climate.—The atmosphere of the islands is generally hazy, especially in the direction of Africa. With occasional exceptions, during the summer and autumn, the north-east trade is the prevailing wind, blowing most strongly from November to May. The rainy season is during August, September and October, when there is a thunder and a light variable wind from south-east or south-west. The Harmattan, a very dry east wind from the African continent, occasionally makes itself felt. The heat of summer is high, the thermometer ranging from 80° to 90° Fahr. near the sea. The unhealthy season is the period during and following the rains, when vegetation springs up with surprising rapidity, and there is much stagnant water, poisoning the air on the lower grounds. Remittent fevers are then common. The people of all the islands are subject in May to an endemic of a bilious nature called locally lepétias, but the cases rarely assume a dangerous form, and recovery is usually attained in three or four days without medical aid. On some of the islands rain has occasionally not fallen for three years. The immediate consequence is a failure of the crops, and this is followed by the death of great numbers from starvation, or the epidemics which usually break out afterwards.

Owing largely to the widespread destruction of timber for fuel, and to the frequency of drought, the flora of the islands is poor when compared with that of the Canaries, the Azores or Madeira. It is markedly tropical in character; and although some seventy wild-flowers, grasses, ferns, &c., are peculiar to the archipelago, the majority of plants are those found on the neighbouring African littoral. Systematic afforestation has not been attempted, but the Portuguese have introduced a few trees, such as the baobab, eucalyptus and dragon-tree, besides many plants of economic value. Coffee-growing, an industry dating from 1790, is the chief resource of the people of Santo Antão, Fogo and São Tiago; maize, millet, sugar-cane, manioc, excellent oranges, pumpkins, sweet potatoes, and, to a less extent, tobacco and cotton are produced. On most of the islands coco-nut and date palms, tamarinds and bananas may be seen; orchid is gathered; and indigo and castor-oil are produced. Of considerable importance is the physic-nut (Jatropha curcas), which is exported.

Pauna.—Quails are found in all the islands; rabbits in Boa Vista, São Tiago and Fogo; wild boars in São Tiago. Both black and grey rats are common. Goats, horses and asses are reared, and goatskins are exported. The neighbouring sea abounds with fish, and coral fisheries are carried on by a colony of Neapolitans in São Tiago. Turtles come from the African coast to lay their eggs on the sandy shores. The Ilheu Branco, or White Islet, between São Nicolau and Santa Luzia, is remarkable as containing a variety of puffin unknown elsewhere, and a species of large lizard (Macroscinclus cociel) which feeds on plants.

Inhabitants.—The first settlers on the islands imported negro slaves from the African coast. Slavery continued in full force until 1854, when the Portuguese government freed the public slaves, and ameliorated the conditions of private ownership. In 1857 arrangements were made for the gradual abolition of slavery, and by 1876 the last slave was legally emancipated. The transportation of convicts from Portugal, a much-dreaded punishment, was continued until the closing years of the 19th century. It was the coexistence of these two forms of servitude, even more than the climate, which prevented any large influx of Portuguese colonists. Hence the blacks and mulattoes far outnumber the white inhabitants. They are, as a rule, taller than the Portuguese, and of fine physique, with regular features but woolly hair. Slavery and the ever-varying climate have left their mark on the habits of the people, whose indolence and fatalism are perhaps their most obvious qualities. Their language is a bastard Portuguese, known as the língua creola. Their religion is Roman Catholicism, combined with a number of pagan beliefs and rites, which are fostered by the curandeiros or medicine men. These superstitions tend to disappear gradually before the advance of education, which has progressed considerably since 1867, when the first school, a lyceum, was opened in Ribeira Brava, the capital of São Nicolau. On all the inhabited islands, except Santa Luzia, there are churches and primary schools, conducted by the government or the priests. The children of the wealthier classes are sent to the government schools.

Government.—The archipelago forms one of the foreign provinces of Portugal, and is under the command of a governor-in-chief appointed by the crown. There are two principal judges, one for the windward and another for the leeward group, the former with his residence at São Nicolau, and the latter at Praia; and each island has a military commandant, a few soldiers, and a number of salaried officials, such as police, magistrates and custom-house directors. There is also an ecclesiastical establishment, with a bishop, dean and canons.

Industries.—The principal industries, apart from agriculture, are the manufacture of sugar, spirits, salt, cottons and straw hats and fish-curing. The average yearly value of the exports is about £40,000; that of the imports (including £50,000 for coal), about £53,000. The most important of the exports are coffee, physic-nuts, millet, sugar, spirits, salt, live animals, skins and fish. This trade is principally carried on with Lisbon and the Portuguese possessions on the west coast of Africa, and with Madeira, and a very small quantity passes to the United States, particularly to New York.

Santo Antão (pop. 25,000), at the extreme north-west of the archipelago, has an area of 265 sq. m. Its surface is very rugged and stony; the scenery on the north-western side is interspersed with narrow, steep-sided valleys, in which the highest peak is the Topoda Coroa (7300 ft.), also known as the Sugar-loaf. Mineral springs exist in many places. The island is the most picturesque, the healthiest, and, on its north-western slope, the best watered and timbered of the group. The island is also very rich in water, being sited in a moistly fertile district, which is the result of the prevailing trade-winds, which have an entirely different appearance, black rocks, white pumice and red clay being its most characteristic features. Santo Antão produces large quantities of sugar and coffee, and has a sugar-mill at the port of Mindel. Its climate is, however, very unhealthy, as it is situated at the foot of the scarp facing the wind. The only harvest of the island is the crop of pumice, a rock of volcanic origin, which is used in the manufacture of glass. There are many small, isolated volcanic cones on the island, and its most striking feature is the beautiful Tarrafal Bay, on the south-west coast, and the most frequented Ponta do Sol, on the north-east, 18 m. from the capital. Ribbons of coral, a species of blue sponge, and a species of sponge (Pachymnesia) are found in the neighbourhood. In 1789 the slaves on Santo Antão were declared free, but this decree was not carried out. About the same time many white settlers, chiefly from the Canaries, entered the island, and introduced the cultivation of tobacco.

São Vicente, or St Vincent (8600), lies to the north-east of Santo Antão, and has an area of 75 sq. m. Its highest point is Monte Verde (2400 ft.). The whole island is arid and sterile as the south-eastern half of Santo Antão, and for the same reason. It was practically uninhabited until 1755; in 1829 its population numbered about 100. Its harbour, an extinct crater on the north coast, with an entrance eroded by the sea, affords complete shelter from every wind. An English seacap founded a coaling station here in 1851, and the town of Mindelo, also known as Porto Grande or St Vincent, grew up rapidly, and became the commercial centre of the archipelago. Most of the business is in English hands, and nine-tenths of the inhabitants understand English. Foodstuffs, wood and water are imported from Santo Antão, and the water is stored in a large reservoir at Mindelo. São Vicente has a station for the submarine cable from Lisbon to Pernambuco in Brazil.

Santa Luzia, about 5 m. south-east, has an area of 18 sq. m., and is the most fertile and best watered of the group. Its capital, Pilos, has a fine and sheltered anchorage, and is the residence of the family of the proprietor. Its highest point is 885 ft. above sea-level. On the south-west it has a good harbour, visited by whaling and fishing boats. Much orchil was formerly gathered, and there is a sulphur fountain from which sulphur is obtained. Little to the south are the uninhabited islets of Branco and Razo.

São Nicolau, or Nicolau (12,000), a long, narrow, crescent-shaped island with an area of 126 sq. m., lies farther east, near the middle of the archipelago. Its capital, Praia, is a large and pretty town, surrounded by a strong fortification, and is the port of entry of the island; the other, Monte Gordo, is near the west end, and has a height of 4280 ft. All the other islands of the group can be seen from São Nicolau in clear weather. Vessels frequently enter Praia, or Freshwater Bay, near the south-east extremity of the island, for water and fresh provisions; and the custom-house is here. The island was one of the first colonized; in 1774 its inhabitants numbered 15,500, but famine subsequently caused a great decrease. The first capital, Lapa, at the end of a promontory on the south,
was abandoned during the period of Spanish ascendency over Portugal (1580–1640) in favour of Ribeira Brava (1500), on the north coast, a town which now has a considerable trade.

Sal (750), in the north-east of the archipelago, has an area of 73 sq. m. It is the seat of a bishop and an island of volcanic origin, forming a flattish, larger part of its surface. It derives its modern name from a natural salt-spring, but most of the salt produced here is now obtained from artificial salt-pans. Towards the close of the 17th century, more salt was produced by the inhabitants of Sal than by the inhabitants of all Madeira, and the salt was exported to the surrounding islands as well as to other parts of the world.

In 1705 it was entirely abandoned, owing to drought and consequent famine; and only in 1808 was the manufacture of salt resumed. A railway, the first built in Portuguese territory, was completed from Sal to Ribeira Brava in 1863. The railway was closed for a time nearly destroyed the salt-trade. Whales, turtles and fish are abundant, and dairy-farming is a prosperous industry. There are many small harbours, which render every part of the island easily accessible.

Boa Vista (2600), the most easterly island of the archipelago, has an area of 235 sq. m. It was named São Christopher by its discoverers in the 15th century. Its modern name, meaning "fair," is singularly inappropriate, for with the exception of a coal deposit, little of economic value seems to exist.

The interior is a flat plateau, broken by low ridges, with a few small streams. There are no large towns, but Ribeira Brava, settled in 1503, was the first settlement made on Boa Vista. It was abandoned in 1705 and has since been reoccupied. The island has a good harbour, but is otherwise unimportant.

In 1911, a railway was completed from Ribeira Brava to Boa Vista, and a telegraph line was laid across the island. The island is now a popular resort for tourists.

Maio (1000), an area of 70 sq. m. It is the most populous and the largest of the Cape Verde Islands, having an area of 350 sq. m. It is also one of the most unhealthy, except among the mountains over 2000 ft. high.

The interior is a mass of volcanic peaks, formed of basalt covered with yellowish sand and clay, and cut through by numerous streams. The island is divided into north and south, and contains a large town, known as the capital, Porto Sal Rei, on the western side (pop. about 1000).

A chain of heights, flanked by lower ranges, traverses the middle of Maio, culminating in Monte Gallego (1301 ft.), towards the west. In the north-western part of the island is a large salt-pan, measuring 620 sq. m., which is inundated with water during the rainy season; and there are extensive salt-pans, where the sea-water is evaporated by the heat of the sun. Salt and orchard are exported. A good deal of salt is also taken from the coast and supplies the impoverished islanders with much of their food.

São Tiago (63,000) is the most populous and the largest of the Cape Verde Islands, having an area of 350 sq. m. It is also one of the most unhealthy, except among the mountains over 2000 ft. high.

other English Henries are transferred from various well-known chroniclers. The *Chronicle* was edited for the “Rolls” Series by Francis Charles Hingeston (London, 1858); the *Liber de illustribus Henricis* was edited (London, 1858) for the same series by F. C. Hingeston, who published an English translation the same year. The editing of both the works is very uncritical and bad.

**CAP HAITIEN, CAPE HAITIEN OR HAITIEN, a seaport of Haiti, West Indies. Pop. about 15,000. It is situated on the north coast, 90 m. N. of Port au Prince, in 10° 46′ N. and 72° 14′ W. Its original Indian name was Guarico, and it has been known, at various times, as Cabo Santo, Cap Français and Cape Henri, while throughout Haiti it is always called Le Cap. It is the most picturesque town in the republic, and the second in importance. On three sides it is hemmed in by lofty mountains, while on the fourth it overlooks a safe and commodious harbour. Under the French rule it was the capital of the colony, and its splendid, wealth and luxury earned for it the title of the *Paris of Haiti.* It was then the seat of an archbishop and possessed a large and flourishing university. The last remains of its former glory were destroyed by the earthquake of 1842 and the British bombardment of 1865. Although now but a collection of brown and wooden huts with here and there a small hut warehouse, it is the centre of a thriving district and does a large export trade. It was founded by the Spaniards about the middle of the 17th century, and in 1687 received a large French colony. In 1695 it was taken and burned by the British, and in 1791 it suffered the same fate at the hands of Toussaint L’Ouverture. It then became the capital of King Henri Christophe’s dominions, but since his fall it has suffered severely in numerous revolutions.

**CAPILLARY ACTION.** A tube, the bore of which is so small that it will only admit a hair (Lat. *capilla*), is called a capillary tube. When such a tube of glass, open at both ends, is placed vertically with its lower end immersed in water, the water is observed to rise in the tube, and to stand within the tube at a higher level than the water outside. The action between the capillary tube and the water has been called capillary action, and the name has been extended to many other phenomena which have been found to depend on properties of liquids and solids similar to those which cause water to rise in capillary tubes.

The forces which are concerned in these phenomena are those which act between neighbouring parts of the same substance, and which are called forces of a solid nature. It is well understood that, unlike the actions between two portions of different kinds, which are called forces of adhesion. These forces are quite insensible between two portions of matter separated by any distance which we can directly measure. It is only when the distance becomes exceedingly small that these forces become perceptible. G. H. Quincke (Pogg. Ann. cxxxvii. p. 402) made experiments to determine the greatest distance at which the effect of these forces is sensible, and he found for various substances distances about the twenty-thousandth part of a millimetre.

**Historical.**—According to J. C. Poggendorff (Pogg. Ann. ci. p. 551), Leonardo da Vinci must be considered as the discoverer of capillary phenomena, but the first accurate observations of the capillary action of tubes and glass plates were made by Francis Hawksbee (Physico-Mechanical Experiments, London, 1700, pp. 139-169; and Phil. Trans., 1711 and 1712), who ascribed the action to an attraction between the glass and the liquid. He observed that the effect was the same in thick tubes as in thin, and concluded that only those particles of the glass which are very near the surface have any influence on the phenomenon. Dr James Jurin (Phil. Trans., 1718, p. 730, and 1719, p. 1083) showed that the height at which the liquid is sustained depends on the section of the tube at the surface of the liquid, and is independent of the form of the lower part of the tube. He considered that the suspension of the liquid is due to "the attraction of the periphery or section of the surface of the tube, to which the upper surface of the water is contiguous and coheres." From this he showed that the rise of the liquid in tubes of the same substance is inversely proportional to their radium. Sir Isaac Newton devoted the 31st query in the last edition of his *Opticks* to molecular forces, and instanced several examples of the cohesion of liquids, such as the suspension of mercury in a barometer tube at more than double the height at which it usually stands. This arises from its adhesion to the tube, and the upper part of the mercury sustains a considerable tension, or negative pressure, without the separation of its parts. He considered the capillary phenomena to be of the same kind, but his explanation is not sufficiently explicit with respect to the nature and the limits of the action of the attractive force.

It is to be observed that, while these early speculators ascribed the phenomena to attraction, they do not distinctly assert that this attraction is sensible only at insensible distances, and that for all distances which we can directly measure the force is altogether insensible. The idea of such forces, however, had been distinctly formed by Newton, who gave the first example of the calculation of the effect of such forces in his theorem on the alteration of the path of a light-corpuscle when it enters or leaves a dense body.

Alain Claude Clairaut (Théorie de la figure de la terre, Paris, 1750, pp. 105, 149) appears to have been the first to show the necessity of taking account of the attraction between the parts of the fluid itself in order to explain the phenomena. He did not, however, recognize the fact that the distance at which the attraction is sensible is not only small but altogether insensible. J. A. von Segner (Comment. Soc. Reg. Göthing. i. (1751) p. 301) introduced the very important idea of the surface-tension of liquids, which he ascribed to attractive forces, the sphere of whose action is so small "ut nullo adhuc sensu percipi poterint." In attempting to calculate the effect of this surface-tension in determining the form of a drop of the liquid, Segner took account of the curvature of a meridian section of the drop, but neglected the effect of the curvature in a plane at right angles to this section.

The idea of surface-tension introduced by Segner had a most important effect on the subsequent development of the theory. We may regard it as a physical fact established by experiment in the same way as the laws of the elasticity of solid bodies. We may investigate the forces which act between finite portions of a solid, and determine the effect of these forces acting between finite portions of a solid. The experiments on solids lead to certain laws of elasticity expressed in terms of coefficients, the values of which can be determined only by experiments on each particular substance. Various attempts have also been made to deduce these laws from particular hypotheses as to the action between the molecules of the elastic substance. We may therefore regard the theory of elasticity as consisting of two parts. The first part establishes the laws of the elasticity of a finite portion of the solid subjected to a homogeneous strain, and deduces from these laws the equations of the equilibrium and motion of a body subjected to any forces and displacements. The second part endeavours to deduce the facts of the elasticity of a finite portion of the substance from hypotheses as to the motion of its constituent molecules and the forces acting between them. In like manner we may by experiment ascertain the general fact that the surface of a liquid is in a state of tension similar to that of a membrane stretched equally in all directions, and prove that this tension depends only on the nature and temperature of the liquid and not on its form, and we may deduce a principle of surface tension which we may call the principle of the phenomena of capillary action. This is one step of the investigation. The next step is to deduce this surface-tension from a hypothesis as to the molecular constitution of the liquid and of the bodies that surround it. The scientific importance of this step is to be measured by the degree of insight which it affords or promises into the molecular constitution of real bodies by the suggestion of experiments by which we may discriminate between rival molecular theories.

1 In this revision of James Clerk Maxwell’s classical article in the ninth edition of the *Encyclopaedia Britannica*, additions are marked by square brackets.
In 1756 J. G. Leidenfrost (De aquae communis nonnullis qualitatis tractatus, Duisburg) showed that a soap-bubble tends to contract, so that if the tube with which it was blown is left open the bubble will diminish in size and will expel through the tube the air which it contains. He attributed this force, however, not to any general property of the surfaces of liquids, but to the fatty part of the soap which he supposed to separate itself from the other constituents of the solution, and to form a thin skin on the outer face of the bubble.

In 1787 Gaspard Monge (Mémoires de l’Acad. des Sciences, 1787, p. 506) asserted that “by supposing the adherence of the particles of a fluid to have a sensible effect only at the surface itself and in the direction of the surface it would be easy to determine the curvature of the surfaces of fluids in the neighbourhood of the solid boundaries which contain them; that these surfaces would be *limitariae* of which the tension, constant in all directions, would be everywhere equal to the adherence of two particles, and the phenomena of capillary tubes would then present nothing which could not be determined by analysis.” He applied this principle of surface-tension to the explanation of the apparent attraction of the fluid between two solid bodies.

In 1802 John Leslie (Phil. Mag., 1802, vol. xiv. p. 103) gave the first correct explanation of the rise of a liquid in a tube by considering the effect of the attraction of the solid on the very thin stratum of the liquid in contact with it. He did not, like the earlier speculators, suppose this attraction to act in an upward direction so as to support the fluid directly. He showed that the attraction is everywhere normal to the surface of the solid. The direct effect of the attraction is to increase the pressure of the stratum of the fluid in contact with the solid, so as to make it greater than the pressure in the interior of the fluid. The result of this pressure if unopposed is to cause this stratum to spread itself over the surface of the solid as a drop of water is observed to do when placed on a clean horizontal glass plate, and this even when gravity opposes the action, as when the drop is placed on the under surface of the plate. Hence a glass tube plunged into water would become wet all over were it not that the ascending liquid film carries up a quantity of other liquid which coheres to it, so that when it has ascended to a certain height the weight of the column balances the force by which the film is thrown itself over the glass. This explanation of the action of the solid is equivalent to that by which Gauss afterwards supplied the defect of the theory of Laplace, except that, not being expressed in terms of mathematical symbols, it does not indicate the mathematical relation between the attraction of individual particles and the final result. Leslie’s theory was afterwards treated according to Laplace’s mathematical methods by James Ivory in the article on capillary action, under “Fluids, Elevation of,” in the supplement to the fourth edition of the *Encyclopaedia Britannica*, published in 1819.

In 1804 Thomas Young (Essay on the “Coherence of Fluids,” Phil. Trans., 1805, p. 65) founded the theory of capillary phenomena on the principle of surface-tension. He also observed the constancy of the angle of contact of a liquid surface with a solid, and showed how from these two principles to deduce the phenomena of capillary action. His essay contains the solution of a great number of cases, including most of those afterwards solved by Laplace, but his methods of demonstration, though always correct, and often extremely elegant, are sometimes rendered obscure by his scrupulous avoidance of mathematical symbols. Having applied the secondary principle of surface-tension to the various particular cases of capillary action, Young proceeded to deduce this surface-tension from uterior principles. He supposed the particles to act on one another with two different kinds of forces, one of which, the attractive force of cohesion, extends to particles at a greater distance than those to which the repulsive force is confined. He further supposed that the attractive force is constant throughout the minute distance to which it extends, but that the repulsive force increases rapidly as the distance diminishes. He thus showed that at a curved part of the surface, a superficial particle would be urged towards the centre of curvature of the surface, and he gave reasons for concluding that this force is proportional to the sum of the curvatures of the surface in two normal planes at right angles to each other.

The subject was next taken up by Pierre Simon Laplace (Mécanique céleste, supplement to the tenth book, pub. in 1806). His results are in many respects identical with those of Young, but his methods of arriving at them are very different, being conducted entirely by mathematical calculations. The form into which he threw his investigation seems to have deterred many able physicists from the inquiry into the ulterior cause of capillary phenomena, and induced them to rest content with deriving them from the fact of surface-tension. But for those who wish to study the molecular constitution of bodies it is necessary to study the effect of forces which are sensible only at insensible distances; and Laplace has furnished us with an example of the method of this study which has never been surpassed. Laplace investigated the force acting on the fluid contained in an infinitely slender canal normal to the surface of the fluid arising from the attraction of the parts of the fluid outside the canal. He expressed for the pressure at a point in the interior of the fluid an expression in the form

$$p = K + H \left( \frac{1}{r} + \frac{1}{r'} \right),$$

where K is a constant pressure, probably very large, which, however, does not influence capillary phenomena, and therefore cannot be determined from observation of such phenomena; H is another constant on which all capillary phenomena depend; and R and R’ are the radii of curvature of any two normal sections of the surface at right angles to each other.

In the first part of our own investigation we shall adhere to the symbols used by Laplace, as we shall find that an accurate knowledge of the physical interpretation of these symbols is necessary for the further investigation of the subject. In the *Supplement to the Theory of Capillary Action*, Laplace deduced the equation of the surface of the fluid from the condition that the resultant force on a particle at the surface must be normal to the surface. His explanation, however, of the rise of a liquid in a tube is based on the assumption of the constancy of the angle of contact for the same solid and fluid, and of this he has nowhere given a satisfactory proof. In this supplement Laplace gave many important applications of the theory, and compared the results with the observations of Lesly in the *Figures de Gay Lussac*.

The next great step in the treatment of the subject was made by C. F. Gauss (Principia generalia Theoriae Figurem Fluidorum in statu Aquilibr cum, Götttingen, 1830, or Werke, v. 29, Götttingen, 1867). The principle which he adopted is that of virtual velocities, a principle which under his hands was gradually transforming itself into what is now known as the principle of the conservation of energy. Instead of calculating the direction and magnitude of the resultant force on each particle arising from the action of neighbouring particles, he formed a single expression which is the aggregate of all the potentials arising from the mutual action between pairs of particles. This expression has been called the force-function. With its sign reversed it is now called the potential energy of the system. It consists of three parts, the first depending on the action of gravity, the second on the mutual action between the particles of the fluid, and the third on the action between the particles of the fluid and the particles of a solid or fluid in contact with it.

The condition of equilibrum is that this expression (which we may for the sake of distinction call the potential energy) shall be a minimum. This condition with the subject out gives not only the equation of the free surface in the form already established by Laplace, but the conditions of the angle of contact of this surface with the surface of a solid.

Gauss thus supplied the principal defect in the great work of Laplace. He also pointed out more distinctly the nature of the assumptions which we must make with respect to the law of action of the particles in order to be consistent with observed phenomena. He did not, however, enter into the explanation of particular phenomena, as this had been done already by Laplace, but he pointed out to physicists the advantages of the
method of Segner and Gay Lussac, afterwards carried out by Quincke, of measuring the dimensions of large drops of mercury on a horizontal or slightly concave surface, and those of large bubbles of air in transparent liquids resting against the under side of a horizontal plate of a substance wetted by the liquid.

In 1831 Simon Denis Poisson published his Nouvelle Théorie de l’action capillaire. He maintained that there is a rapid variation of density near the surface of a liquid, and he gave very strong reasons, which have been only strengthened by subsequent discoveries, for believing that this is the case. He proceeded to an investigation of the equilibrium of a fluid on the hypothesis of uniform density, and arrived at the conclusion that on this hypothesis none of the observed capillary phenomena would take place, and that, therefore, Laplace’s theory, in which the density is supposed uniform, is not only insufficient but erroneous. In particular he maintained that the constant pressure K, which occurs in Laplace’s theory, and which on that theory is very large, must be in point of fact very small, but the equation of equilibrium from which he concluded this is itself defective. Laplace assumed that the liquid has uniform density, and that the attraction of its molecules extends to a finite though insensible distance beyond these; these are certain, and are confirmed by the independent method of Gauss, so that the objections raised against them by Poisson fall to the ground. But whether the assumption of uniform density be physically correct is a very different question, and Poisson rendered good service to science in showing how to carry on the investigation on the hypothesis that the density very near the surface is different from that in the interior of the fluid.

The result, however, of Poisson’s investigation is practically equivalent to that already obtained by Laplace. In both theories the equation of the liquid surface is the same, involving a constant H, which can be determined only by experiment. The only difference is in the manner in which this quantity H depends on the law of the molecular forces and the law of density near the surface of the fluid, and as these laws are unknown to us we cannot obtain any test to discriminate between the two theories.

We have now described the principal forms of the theory of capillary action during its earlier development. In more recent times the method of Gauss has been modified so as to take account of the variation of density near the surface, and its language has been translated in terms of the modern doctrine of the conservation of energy.1

J. A. F. Plateau (Statique expérimentale et théorique des liquides), who made elaborate study of the phenomena of surface-tension, adopted the following method of getting rid of the effects of gravity. He formed a mixture of alcohol and water of the same density as olive oil, and then introduced a quantity of oil into the mixture. It assumes the form of a sphere under the action of surface-tension alone. He then, by means of rings of iron-wire, disks and other contrivances, altered the form of certain parts of the surface of the oil. The free portions of the surface then assume new forms depending on the equilibrium of surface-tension. In this way he produced a great many of the forms of equilibrium of a liquid under the action of surface-tension alone, and compared them with the results of more modern investigations. He also greatly facilitated the study of liquid films by showing how to form a liquid, the films of which will last for twelve or even for twenty-four hours. The debt which science owes to Plateau is not diminished by the fact that, while investigating these beautiful phenomena, he never himself saw them, having lost his sight in about 1840.

of the phenomena of surface-tension, and showed their connexion with the experiments of Charles Tomlinson on the figures formed by oils dropped on the clean surface of water.

Athanase Dupré in his 5th, 6th and 7th Memoirs on the Mechanical Theory of Heat (Ann. de Chimie et de Physique, 1866–1868) applied the principles of thermodynamics to capillary phenomena, and the experiments of his son Paul were exceedingly ingenious and well devised, tracing the influence of surface-tension in a great number of very different circumstances, and deducing from independent methods the numerical value of the surface-tension. The experimental evidence which Dupré obtained bearing on the molecular structure of liquids must be very valuable, even if our present opinions on this subject should turn out to be erroneous.

F. H. R. Lüdtke (Pogg. Ann. cxxxix. p. 620) experimented on liquid films, and showed how a film of a liquid of high surface-tension is replaced by a film of lower surface-tension. He also experimented on the effects of the thickness of the film, and came to the conclusion that the thinner a film is, the greater is its tension. This result, however, was tested by Van der Mensbrugge, who found that the tension is the same for the same mixture and whatever be the thickness, as long as the film does not burst. [The continued coincidence of Dupré’s and Lussac’s results, as evidenced by the colours in the same film, affords an instantaneous proof of this conclusion.] The phenomena of very thin liquid films deserve the most careful study, for it is in this way that we are most likely to obtain evidence by which we may test the theories of the molecular structure of liquids.

Sir W. Thomson (afterwards Lord Kelvin) investigated the effect of the curvature of the surface of a liquid on the thermal equilibrium between the liquid and the vapour in contact with it. He also calculated the effect of surface-tension on the propagation of waves on the surface of a liquid, and determined the minimum velocity of a wave, and the velocity of the wind when it is just sufficient to disturb the surface of still water.

Theory of Capillary Action

When two different fluids are placed in contact, they may either diffuse into each other or remain separate. In some cases diffusion takes place to a limited extent, after which the resulting mixtures do not mix with each other. The same substance may be able to exist in two different states at the same temperature and pressure, as when water and its saturated vapour are contained in the same vessel. The conditions under which the thermal and mechanical equilibrium of two fluids, two mixtures, or the same substance in two physical states in contact with each other, is possible, belong to thermodynamics. All that we have to observe at present is that, in the cases in which the fluids do not do mix of themselves, the potential energy of the system must be greater when the fluids are mixed than when they are separate.

It is found by experiment that it is only very close to the bounding surface of a liquid that the forces arising from the mutual action of its parts have any resultant effect on one of its particles. The experiments of Quincke and others seem to show that the extreme range of the forces which produce capillary action lies between a thousandth and a twenty-thousandth part of a millimetre.

We shall use the symbol $\epsilon$ to denote this extreme range, beyond which the action of these forces may be regarded as insensible. If $\chi$ denotes the potential energy of unit of mass of the substance, we may treat $\chi$ as sensibly constant except within a distance $\epsilon$ of the bounding surface of the fluid. In the interior of the fluid it has the uniform value $\chi_0$. In like manner the density, $\rho$, is sensibly equal to the constant quantity $\rho_0$, which is its value in the interior of the liquid, except within a distance $\epsilon$ of the bounding surface. Hence if $V$ is the volume of a mass $M$ of liquid bounded by a surface whose area is $S$, the integral

$$M = \iiint_{\epsilon} \rho \, d\mathbf{x} \, d\mathbf{y} \, d\mathbf{z} = \ldots \ldots \ldots (1)$$

where the integration is to be extended throughout the volume
Adding these expressions, and dividing the second member by 2, we obtain for the tension of the surface of contact of the two liquids

$$T_{12} = \frac{1}{2} \left( \sigma _{1} + \sigma _{2} \right) + \frac{1}{2} \int (\chi_1 - X_0) \, d\alpha V \rho_2 .$$

If this quantity is positive, the surface of contact will tend to contract, and the liquids will remain distinct. If, however, it were negative, the displacement of the liquids which tends to enlarge the surface of contact would be aided by the molecular forces, so that the liquids, if kept separate by gravity, would at length become thoroughly mixed. Now, however, of a phenomenon of this kind has been discovered, for those liquids which mix of themselves do so by the process of diffusion, which is a molecular motion, and not by the spontaneous puckering and replication of the bounding surface as would be the case if there were negative.

It is probable, however, that there are many cases in which the integral belonging to the less dense fluid is negative. If the denser body be solid we can often demonstrate this; for the liquid tends to spread itself over the surface of the solid, as to increase the area of the surface of contact, even although in so doing it is obliged to increase the free surface in opposition to the surface-tension. Thus water spreads itself out on a clean surface of glass. This shows that the 

$$\int (x - x_0) \, d\alpha$$

must be negative for water in contact with glass.

**On the Tension of Liquid Films.** — The method already given for the investigation of the surface-tension of a liquid, all whose dimensions are sensible, fails in the case of a liquid film such as a soap-bubble. In such a film it is possible that no part of the liquid may be so far from the surface as to have the potential and density corresponding to what we have called the interior of a liquid mass, and measurements of the tension of the film when drawn out to different degrees of thinness may possibly lead to an estimate of the range of the molecular forces, or at least of the depth within a liquid mass, at which its properties become sensibly uniform. We shall therefore indicate a method of investigating the tension of such films.

Let $S$ be the area of the film, $M$ its mass, and $E$ its energy; $\sigma$ the energy of unit of area; then

$$M = S \sigma ,$$

$$E = S \sigma .$$

Let us now suppose that by some change in the form of the boundary of the film its area is changed from $S$ to $S + dS$. If its mass is $T$ the work required to effect this increase of surface will be $T dS$, and the energy of the film will be increased by this amount. Hence

$$T dS = E dS + S dE .$$

But since $M$ is constant,

$$dM = S dE + E dS = 0 .$$

Eliminating $dS$ from equations (13) and (14), and dividing by $S$, we find

$$T = E dE .$$

In this expression $T$ denotes the mass of unit area of the film, and $E$ the energy of unit of area.

If we take the axis of $z$ normal to either surface of the film, the radius of curvature of which we suppose to be very great compared with its thickness $\epsilon$, and if $\rho$ is the density, and $\chi$ the energy of unit of mass at depth $z$, then

$$\sigma = \int_0^\infty d\alpha .$$

and

$$\sigma = \int_0^\infty d\alpha .$$

Both $\rho$ and $\chi$ are functions of $z$, the value of which remains the same when $z$ is substituted for $z$. If the thickness of the film is greater than $2\epsilon$, then the thickness $\epsilon$ is divided equally in the middle of the film, within which the values of $\rho$ and $\chi$ will be $\rho_0$ and $\chi_0$. In the two strata on either side of this the law, according to which $\rho$ and $\chi$ depend on the depth, will be the same as in a liquid mass of large dimensions. Hence in this case

$$\sigma = (c - 2\epsilon) \rho_0 + \frac{1}{2} \chi_0 \rho_0^2 ,$$

$$\sigma = (c - 2\epsilon) \rho_0 + \frac{1}{2} \chi_0 \rho_0^2 .$$

Hence the tension of a thick film is equal to the sum of the tensions of its two surfaces as already calculated (equation 7). On the hypothesis of uniform density we shall find that this is true for films whose thickness exceeds $\epsilon$.

The symbol $\chi$ is defined as the energy of unit of mass of the substance. A knowledge of the absolute value of this energy is not required, since in every expression in which it occurs it is under the
form $\chi - \chi_0$, that is to say, the difference between the energy in two different states. The only cases, however, in which we have experimental values of this quantity are when the substance is either liquid and surrounded by similar liquid, or gaseous and surrounded by the same gas. It is impossible to make direct measurements of the properties of particles of the substance within the insensible distance $\varepsilon$ of the bounding surface.

When a liquid is in thermal and dynamical equilibrium with its vapour, then if $\rho$ and $x$ are the values of $\rho$ and $x$ in the vapour, and $\rho_0$ and $\chi_0$ those for the liquid,

$$x - \chi_0 = -p(L1/\rho_0 - 1/\rho),$$

where $L$ is the dynamical equivalent of heat, $T$ is the latent heat of unit of mass of the vapour, and $p$ is the pressure. At points in the liquid very near its surface it is probable that $\chi$ is greater than $\chi_0$, and at points in the gas very near the surface it is probable that $\chi$ is less than $\chi_0$, but this has not as yet been ascertained experimentally. We shall therefore endeavour to apply to this subject the methods used in Thermodynamics, and where these fail we shall have recourse to the hypotheses of molecular physics.

We have next to determine the value of $\chi$ in terms of the action between one particle and another. Let us suppose that the force between two particles $m$ and $m'$ at the distance $f$ is

$$F = m'm\phi(f) + Cm'^2,$$

being reckoned positive when the force is attractive. The actual force between the particles arises in part from their mutual gravitation, which is inversely as the square of the distance. This force is expressed by $m'm\phi(f)$. It is easy to show that a force subject to this law would not account for capillary action. We shall, therefore, in what follows, consider only that part of the force which depends on $\phi(f)$, where $\phi(f)$ is a function of $f$ which is insensible for all sensible values of $f$, but which becomes sensible and even enormously great when $f$ is exceedingly small.

If we next introduce a new function $f$ and write

$$\int f\phi(f)df = \Pi(f),$$

then $m'm\Pi(f)$ will represent $(1)$ The work done by the attractive force on the particle $m$, while it is brought from an infinite distance from $m'$ to the distance $f$ from $m'$; or $(2)$ The attraction of a particle $m$ on a narrow straight rod resolved in the direction of the length of the rod, one extremity of the rod being at a distance $f$ from $m$, and the other at an infinite distance, the mass of unit of length of the rod being $m'$. The function $\Pi(f)$ is also insensible for sensible values of $f$, but for insensible values of $f$ it may become sensible and even very great.

If we next write

$$\int f'\Pi(f)df = \phi(s),$$

then $2m'm\phi(s)$ will represent $(1)$ The work done by the attractive force while a particle $m$ is brought from an infinite distance to a distance $s$ from an infinitely thin stratum of the substance whose mass per unit of area is $s$; $(2)$ The attraction of a particle $m$ placed at a distance $s$ from the plane surface of an infinite solid whose density is $s$.

Let us examine the case in which the particle $m$ is placed at a distance $s$ from a curved stratum of the substance, whose principal radii of curvature are $R_1$ and $R_2$. Let $P$ (fig. 2) be a particle and $PQ$ a normal to the surface. Let the plane of the paper be a normal section of the surface of the stratum at the point $B$, making an angle $\omega$ with the section whose radius of curvature is $R_1$.

Let $PO = \theta$, $PO = r$, $PO = f$, $BP = s$, $f = u\sin\omega - 2\cos\omega \sin \theta$. \hspace{1cm} (25)

The element of the stratum at $Q$ may be expressed by $u\sin\omega \sin \theta dh$, or expressing $dh$ in terms of $df$ by (26),

$$2\sin\omega \sin \theta df.$$

Multiplying this by $m$ and by $\phi(f)$, we obtain for the work done by the attraction of this element when $m$ is brought from an infinite distance to $P$,

$$m\phi(f)\Pi(f)df.$$

Integrating with respect to $f$ from $f = \infty$ to $f = a$, where $a$ is a line very great compared with the extreme range of the molecular force, but very small compared with either of the radii of curvature, we obtain for the work

$$m\phi(f)\Pi(f)df,$$

and since $\phi(s)$ is an insensible quantity we may omit it. We may also write

$$ur^2 = 1 + zr^2 + \&c.$$

since $z$ is very small compared with $u$, and expressing $u$ in terms of $\omega$ by (25), we find

$$\int_0^{\infty} \phi(z)\Pi(z)dz = 2m\phi(\infty),$$

This then represents the work done by the attractive forces when a particle $m$ is brought from an infinite distance to the point $P$ at a distance $x$ from a stratum whose surface density is $x$, and whose principal radii of curvature are $R_1$ and $R_2$.

To find the work done when $m$ is brought to the point $P$ in the neighbourhood of a solid body, the density of which is a function of the depth $x$ below the surface, we have only to write instead of $\phi(f)$, and to integrate

$$2m\phi(\infty)\Pi(z)dz,$$

where, in general, we must suppose $\rho$ a function of $z$. This expression, when integrated, gives $(1)$ the work done on a particle $m$ while it is brought from an infinite distance to the point $P$, or $(2)$ the attraction on a long slender column normal to the surface and terminating at $P$, the mass of unit of length of the column being $m$. In the form of the theory given by Laplace, the density of the liquid was supposed to be uniform. Hence if we write

$$K = \int_0^{\infty} \phi(z)\Pi(z)dz,$$

the pressure of a column of the fluid itself terminating at the surface will be

$$p = \frac{K}{z} + \frac{1}{z} + \frac{1}{z},$$

and the work done by the attractive forces when a particle $m$ is brought to the surface of the fluid from an infinite distance will be

$$2m\phi(\infty)\Pi(z)dz.$$

If we write

$$\int_0^{\infty} \phi(z)\Pi(z)dz = \theta(s),$$

then $2m\phi(\infty)\Pi(z)dz$ will express the work done by the attractive forces, while a particle $m$ is brought from an infinite distance to a distance $s$ from the plane surface of a mass of the substance of density $\rho$ and infinitely thick. The function $\theta(s)$ is insensible for all sensible values of $s$. For sensible values it may become sensible, but it must remain finite even when $s = 0$, in which case $\theta(s) = K$.

If $\Pi(z)$ is the potential energy of unit of mass of the substance in vapour, then at a distance $s$ from the plane surface of the liquid

$$K = \int_0^{\infty} \phi(z)\Pi(z)dz = \theta(z).$$

At the surface

$$\chi = \chi' - 4\pi\phi(0).$$

If the liquid forms a stratum of thickness $c$, then

$$\chi = \chi' - 4\pi\phi(0) + 2\pi\phi(c).$$

The density-stratum of this system is $\chi' = \chi' = c$. The energy per unit area is

$$e = \int_0^{\infty} \phi(z)\Pi(z)dz = \theta(z)ds = 2\pi\int_0^{\infty} \theta(c)ds dz.$$

Since the two sides of the stratum are similar the last two terms are equal,

$$e = \int_0^{\infty} \phi(z)\Pi(z)dz = \theta(z)ds.$$

Differentiating with respect to $c$, we find

$$\frac{de}{dc} = \int_0^{\infty} \phi(z)\Pi(z)dz = \theta(c) + 4\pi\phi(c).$$

Hence the surface-tension

$$T = -\frac{de}{dc} = 4\pi\int_0^{\infty} \phi(z)\Pi(z)dz.$$

Integrating the first term within brackets by parts, it becomes

$$\theta(c) - 4\pi\int_0^{\infty} \phi(z)\Pi(z)dz.$$

Remembering that $\theta(0)$ is a finite quantity, and that $\frac{de}{dc} = -\phi(0)$, we find

$$T = 4\pi\int_0^{\infty} \phi(z)\Pi(z)dz.$$

When $c$ is greater than $\varepsilon$ this is equivalent to $2\varepsilon$ in the equation of Laplace. Hence the tension is the same for all films thicker than $\varepsilon$, the range of the molecular forces. For thinner films

$$\frac{de}{dc} = 4\pi\phi(0).$$

Hence if $\phi(0)$ is positive, the tension and the thickness will increase together. Now $2m\phi(c)$ represents the attraction between a particle $m$ and the plane surface of an infinite mass of the liquid, when the distance of the particle outside the surface is $c$. Now, the force between the particle and the liquid is certainly, on the whole, attractive; but if between any two small values of $c$ it should be repulsive, then films whose thickness lies between these values the tension will increase as the thickness diminishes, but for all other cases the tension will diminish as the thickness diminishes.

We have given several examples in which the density is assumed to be uniform, because Poisson has asserted that capillary
phenomena would not take place unless the density varied rapidly
near the surface. In this assertion we think he was mathematically
wrong, though in his own hypothesis that the density does actually
vary, he was probably right. In fact, the quantity $4\pi \rho$, which
we may call with van der Waals the molecular pressure, is so
small for most liquids (5000 atmospheres for water), that in the parts
near the surface, where the molecular pressure varies rapidly, we
may expect considerable variation of density, even when we take into
account the smallness of the compressibility of liquids.

The pressure at any point of the liquid arises from two causes,
the external pressure $P$ to which the liquid is subjected, and the
pressure arising from the mutual attraction of its molecules. If we
suppose that the number of molecules within a sphere of radius $r$
varies as $r^n$ and that the area of a given molecule is very large, the part
of the pressure arising from attraction will be proportional to the square
of the number of molecules in unit of volume, that is, to the square of the
density. Hence we may write

$$p = P + \rho^2$$

where $A$ is a constant (equal to Laplace's intrinsic pressure $K$. But
this equation is applicable only at points in the interior, where $\rho$
is not varying.)

The intrinsic pressure and the surface-tension of a uniform mass
are perhaps more easily found by the following process. The former
may be found at once by calculating the mutual attraction of the
parts of a large mass which lie on opposite sides of an imaginary
plane interface. If $\rho$ be the density of the liquid, and $\zeta$ the
distance of an element of a plane from the other distant plane.
The pressure due to the liquid on a portion of area $A$ is

$$p = \int A \rho(z) \, dz$$

and the attraction between two parallel plates is

$$A \rho(z) \, dz$$

where $\rho(z)$ is the density at a distance $z$ from the plane of
the surface. The work required to produce the separation in question is thus

$$2\pi r^2 \rho(z) \, dz$$

and for the tension of a liquid of density $\rho$ we have

$$T = 2\pi r^2 \rho(z) \, dz$$

The form of this expression may be modified by integration by parts.
For

$$\int_0^z \rho(z) \, dz = \rho(z) \cdot z - \int \frac{\rho'(z)}{2} \, dz$$

Since $\rho(0)$ is finite, proportional to $K$, the integrated term vanishes
at both limits, and we have simply

$$\int_0^z \rho(z) \, dz = \int_0^z \rho'(z) \, dz$$

and

$$T = 2\pi r^2 \rho(z) \, dz$$

In Laplace's notation the second member of (34), multiplied by $2\pi r$
is represented by $11$.

As Laplace has shown, the values for $K$ and $T$ may also be expressed
in terms of the function $\phi$, with which we started. Integrating by
parts, we get

$$\int_0^z \rho(z) \, dz = \phi(z) + \frac{1}{2} K \int_0^z \phi(z) \, dz$$

so that

$$K = \frac{2\pi r^2}{3 \int_0^z \phi(z) \, dz}$$

A few examples of these formulae will promote an intelligent
comprehension of the subject. One of the simplest suppositions
open to us is that

$$\phi(z) = c \beta'$$

From this we obtain

$$\Delta(T) = -\frac{2\pi r^2}{3 \int_0^z \phi(z) \, dz}$$

for the attractive force is mathematically infinite, but practically
of the order $\frac{1}{3}$, and we see that $T$ is of higher order in this
small quantity than $K$. That $K$ is in all cases of the fourth order
and $T$ of the fifth order in the range of the forces is obvious from (37)
without integration.

An apparently simple example would be to suppose $\phi(z) = z$.

We get

$$\Delta(T) = -\frac{2\pi r^2}{3 \int_0^z \phi(z) \, dz}$$

The intrinsic pressure will thus be infinite whatever $\beta$ may be.
If $\frac{1}{3} \beta$ is positive, the attraction of the distant parts contributes
to the result; while if $\frac{1}{3} \beta$ be negative, the parts in immediate
contiguity act with infinite power. For the transition case, discussed
by William Sutherland (Phil. Mag. xxiv. p. 113, 1887), of $\frac{1}{3} \beta = 0$,
and $K$ is also infinite. It seek this therefore that nothing satisfactory can
be arrived at under this head. As a third example, we will take the law proposed by Young, viz.

$$\phi(z) = 1 \text{ from } 0 \text{ to } z = a; \quad \phi(z) = 0 \text{ from } z = a \text{ to } z = \infty;$$

and corresponding thereto in the attractive force as operative in one
direction only. For further calculations on Laplace's principles, see

ON SURFACE-TENSION

Definition.—The tension of a liquid surface across any line
drawn on the surface is normal to the line, and is the same for all
directions of the line, and is measured by the force across an element
of the line divided by the length of that element.

Experimental Laws of Surface-Tension.—1. For any given
liquid surface, as the surface which separates water from air,
or oil from water, the surface-tension is the same at every point
of the surface and in every direction. It is also practically
independent of the curvature of the surface, although it appears
from the mathematical theory that there is a slight increase of
tension where the mean curvature of the surface is concave,
and a slight diminution where it is convex. The amount of this
increase or diminution is too small to be directly measured,
though it has a certain theoretical importance in the explanation
of the equilibrium of the superficial layer of the liquid where it
is inclined to the horizon.

2. The surface-tension diminishes as the temperature rises,
and when the temperature reaches that of the critical point
at which the distinction between the liquid and its vapour ceases,
it has been observed by Andrews that the capillary action also
vanishes. The early writers on capillary action supposed that
the diminution of capillary action was due simply to the change
of density corresponding to the rise of temperature, and, therefore,
assuming the surface-tension to vary as the square of the
density, they deduced its variations from the observed dilatation of the liquid by heat. This assumption, however, does not appear to be verified by the experiments of Brunner and Wolff on the rise of water in tubes at different temperatures.

3. The tension of the surface separating two liquids which do not mix cannot be deduced by any known method from the tensions of the surfaces of the liquids when separately in contact with air.

When the surface is curved, the effect of the surface-tension is to make the pressure on the concave side exceed the pressure on the convex side by a force equal to \( \frac{1}{T} \) (the tension of the surface). This force is called the curvature of the surface.

When three fluids which do not mix are in contact with each other, the three surfaces of separation meet in a line, straight or curved. Let O (fig. 3) be a point in this line, and let the plane of the paper be supposed to be normal to the line at the point O. The three angles between the tangent planes to the three surfaces of separation meet at the point O are completely determined by the tensions of the three surfaces. For if in the triangle abc the side ab is taken so as to represent on a given scale the tension of the surface of contact of the fluids a and b, and if the other sides bc and ca are taken so as to represent on the same scale the tensions of the surfaces between b and c and between c and a respectively, then the condition of equilibrium at O for the corresponding tensions R, P and Q is that the angleROP shall be the supplement of abc, POQ of bca, and, therefore, QOR of cab. Thus the angles at which the surfaces of separation meet are the same at all parts of the line of concourse of the three fluids. When three films of the same liquid meet, their tensions are equal, and, therefore, they make angles of 120° with each other. The froth of soap-soaps or beaten-up eggs consists of a multitude of small films which meet each other at angles of 120°.

If four fluids, \( a, b, c, d \), meet in a point O, and if a tetrahedron ABCD is formed so that its edge AB represents the tension of the surface of contact of the liquids a and b, BC that of b and c, and so on; then if we place this tetrahedron so that the face ABC is normal to the tangent at O to the line of concourse of the fluids ab, and turn it so that the edge AB is normal to the tangent plane at O to the surface of contact of the fluids a and b, then the other three faces of the tetrahedron will be normal to the tangent planes at O to the other three lines of concourse of the liquids, and the other five edges of the tetrahedron will be normal to the tangent planes at O to the other five surfaces of contact.

If six films of the same liquid meet in a point the corresponding tetrahedron is a regular tetrahedron, and each film, where it meets the others, has an angle whose cosine is \(-\frac{1}{2}\). Hence if we take two nets of wire with hexagonal meshes, and place one on the other so that the point of concourse of three hexagons of one net coincides with the middle of a hexagon of the other, and if we then, after dipping them in Plateau's liquid, place them horizontally, and gently raise the upper one, we shall develop a system of plane laminae arranged as the walls and floors of the cells are arranged in a honeycomb. We must not, however, raise the upper net too much, or the system of films will become unstable.

When a drop of one liquid, B, is placed on the surface of another, A, the phenomenon which takes place depends on the relative magnitude of the three surface-tensions corresponding to the surface between A and air, between B and air, and between A and B. If one of these tensions is greater than the sum of the other two, the drop will assume the form of a lens, the angles which the upper and lower surfaces of the lens make with the free surface of A and with each other being equal to the external angles of the triangle of forces. Such lenses are often seen formed by drops of fat floating on the surface of hot water, soup or gravy. But when the surface-tension of A exceeds the sum of the tensions of the surfaces of contact of B with air and with A, it is impossible to construct the triangle of forces, so that equilibrium becomes impossible. The drop is drawn out by the surface-tension of A with a force greater than the sum of the tensions of the two surfaces of the drop. The drop, therefore, spreads itself out, with great velocity, over the surface of A till it covers an enormous area, and is reduced to such extreme tenuity that it is not probable that it retains the same properties of surface-tension which it has in a large mass. Thus a drop of train oil will spread itself over the surface of the sea till it shows the colours of thin plates. These rapidly descend in Newton's scale and at last disappear, showing that the thickness of the film is less than the tenth part of the length of a wave of light. But even when thus attenuated, the film may be proved to be present, since the surface-tension of the liquid is considerably less than that of pure water. This may be shown by placing another drop of oil on the surface. This drop will not spread out like the first drop, but will take the form of a flat lens with a distinct circular edge, showing that the surface-tension of what is still apparently pure water is now less than the sum of the tensions of the surfaces separating oil from air and water.

The spreading of drops on the surface of a liquid has formed the subject of a very extensive series of experiments by Charles Tomlinson; van der Mensbrugge has also written a very complete memoir on this subject (Sur la tension superficielle des liquides, Bruxelles, 1873).

When a solid body is in contact with two fluids, the surface of the solid cannot alter its form, but the angle at which the surface of contact of the two fluids meets the surface of the solid depends on the values of the three surface-tensions. If \( a \) and \( b \) are the two fluids and \( c \) the solid then the equilibrium of the tensions at the point O depends only on that of thin components parallel to the surface, because the surface-tensions normal to the surface are balanced by the resistance of the solid. Hence if the angle ROQ (fig. 4) at which the surface of contact OP meets the solid is denoted by \( \alpha \),

\[
T_a - T_b - T_a \cos \alpha = 0,
\]

Whence

\[
\cos \alpha = \frac{T_a - T_a}{T_b}.
\]

As an experiment on the angle of contact only gives us the difference of the surface-tensions at the solid surface, we cannot determine their actual value. It is theoretically probable that they are often negative, and may be called surface-pressures.

The constancy of the angle of contact between the surface of a fluid and a solid was first pointed out by Dr Young, who states that the angle of contact between mercury and glass is about 140°. Quincke makes it 138° 59′.

If the tension of the surface between the solid and one of the fluids exceeds the sum of the other two tensions, the point of contact will not be in equilibrium, but will be dragged towards the side on which the tension is greatest. If the quantity of the first fluid is small it will stand in a drop on the surface of the solid without wetting it. If the quantity of the second fluid is small it will spread itself over the surface and wet the solid. The angle of contact of the first fluid is 180° and that of the second is zero.

If a drop of alcohol be made to touch one side of a drop of oil on a glass plate, the alcohol will appear to chase the oil over the plate, and if a drop of water and a drop of bisulphide of carbon be placed in contact in a horizontal capillary tube, the bisulphide of carbon will chase the water along the tube. In both cases the liquids move in the direction in which the surface-pressure at the solid is least.

In order to express the dependence of the tension at the interface of two bodies in terms of the forces exercised by the bodies upon themselves and upon one another, we cannot do better than follow the method of Dupré. If \( T_a \) denote the interfacial tension, the energy corresponding to unit area of the interface
is also $T_{13}$, as we see by considering the introduction (through a fine tube) of one body into the interior of the other. A comparison with another method of generating the interface, similar to that previously employed when but one body was in question, will now allow us to evaluate $T_{13}$.

The work required to cleave asunder the parts of the first fluid which lie on the two sides of an ideal plane passing through the interior, is per unit of area $2T_{13}$, and the free surface produced is two units in area. So for the second fluid the corresponding work is $2T_{23}$. This having been effected, let us now suppose that each of the units of area of free surface of fluid (1) is allowed to approach normally a unit area of (2) until contact is established. In this process work is gained which we may denote by $4T_{12} + 2T_{13}$ for each pair. On the whole, then, the work expended in producing two units of interface is $2T_{13} + 2T_{12} - 4T_{13}$, and this, as we have seen, may be equated to $2T_{12}$. Hence

$$T_{13} = T_{12} - 2T_{13}. \quad \ldots \ldots \ldots \ldots \ldots (47)$$

If the two bodies are similar, $T_{13} = T_{12} = T'_{12}$; and $T_{13} = 0$, as it should do.

Laplace does not treat systematically the question of interfacial tension, but he gives incidentally in terms of his quantity $H$ a relation analogous to (47).

If $2T_{12} > T_{13} + T_{12}$, would be negative, so that the interface would of itself tend to increase. In this case the fluids must mix. Conversely, if two fluids mix, it would seem that $T_{12}$ must exceed the mean of $T_{13}$ and $T_{12}$; otherwise work would have to be expended to effect a close alternate stratification of the two bodies, such as we may suppose to constitute a first step in the process of mixture (Dupré, Théorie mécanique de la chaleur, p. 322; Kelvin, Popular Lectures, p. 53).

The value of $T_{13}$ has already been calculated (32). We may write

$$T_{12} = \sigma_{1} + \sigma_{2} = \sigma_{1} + \sigma_{2}, \quad \ldots \ldots \ldots \ldots \ldots (48)$$

and in general the functions $\theta$, or $\phi$, must be regarded as capable of assuming different forms. Under these circumstances there is no limitation upon the values of the interfacial tensions for three fluids, which we may denote by $T_{13}$, $T_{23}$, $T_{12}$.

If the three fluids can remain in contact with one another, the sum of any two of the quantities must exceed the third, and by Neumann's rule the directions of the interfaces at the common edge must be parallel to the sides of a triangle, taken proportional to $T_{13}$, $T_{23}$, $T_{12}$.

If the above-mentioned condition be not satisfied, the triangle is imaginary, and the three fluids cannot rest in contact, the two weaker tensions, even if acting in full concert, being incapable of balancing the strongest. For instance, if $T_{12} > T_{13} + T_{23}$, the second fluid spreads itself infinitely upon the interface of the first and third fluids.

The experimenters who have dealt with this question, C. G. M. Marangoni, van der Memsbridge, Quincke, have all arrived at results inconsistent with the reality of Neumann's triangle. Thus Marangoni says (Pogg. Annalen, cxxiii. p. 348, 1871): "Die gemeinschaftliche Oberfläche zweier Flüssigkeiten hat eine geringere Oberflächenspannung als die Differenz der Oberflächenspannung der Flüssigkeiten selbst (mit Ausnahme des Quecksilbers)." Three pure bodies (of which one may be air) cannot accordingly remain in contact. If a drop of oil stands in lenticular form upon a surface of water, it is because the water-surface is already contaminated with a greasy film.

On the theoretical side the question is open until we introduce some limitation upon the generality of the functions. By far the simplest supposition open to us is that the functions are the same in all cases, the attractions differing merely by coefficients analogous to densities in the theory of gravitation. This hypothesis was suggested by Laplace, and may conveniently be named after him. It was also tacitly adopted by Young, in connexion with the still more special hypothesis which Young probably had in view, namely that the force in each case was constant within a limited range, the same in all cases, and vanished outside that range.

As an immediate consequence of this hypothesis we have from (28)

$$K = K_{0}^{T}, \quad \ldots \ldots \ldots \ldots \ldots (49)$$

$$T = T_{0}^{T}. \quad \ldots \ldots \ldots \ldots \ldots (50)$$

where $K_{0}$, $T_{0}$ are the same for all bodies.

But the most interesting results are those which Young (Works, vol. i. p. 463) deduced relative to the interfacial tensions of three bodies. By (37), (48),

$$T_{12} = \sigma_{1} + \sigma_{2}, \quad \ldots \ldots \ldots \ldots \ldots (51)$$

so that by (47), (50),

$$T_{12} = (\sigma_{1} - \sigma_{2})T_{0} \quad \ldots \ldots \ldots \ldots \ldots (52)$$

According to (52), the interfacial tension between any two bodies is proportional to the square of the difference of their densities. The densities $\sigma_{1}$, $\sigma_{2}$ being in descending order of magnitude, we may write

$$T_{12} = (\sigma_{1} - \sigma_{2})^{2}T_{0}, \quad \ldots \ldots \ldots \ldots \ldots (53)$$

so that $T_{12}$ necessarily exceeds the sum of the other two interfacial tensions. We are thus led to the important conclusion that according to this hypothesis Neumann's triangle is necessarily imaginary, that one of three fluids will always spread upon the interface of the other two.

Another point of importance may be easily illustrated by this theory, viz. the dependency of capillarity upon abruptness of transition. "The reason why the capillary force should disappear when the transition between two liquids is sufficiently gradual will now be evident. Suppose that the transition from $o$ to $\sigma$ is made in two equal steps, the thickness of the intermediate layer of density $\frac{1}{2}$ being large compared to the range of the molecular forces, but small in comparison with the radius of curvature. At each step the difference of capillary pressure is only one quarter of that due to the sudden transition from $o$ to $\sigma$, and thus altogether half the effect is lost by the impregnation of the layer. If there were three equal steps, the effect would be reduced to one-third, and so on. When the number of steps is infinite, the capillary pressure disappears altogether." ("Laplace's Theory of Capillarity," Rayleigh, Phil. Mag., 1883, p. 315.)

According to Laplace's hypothesis the whole energy of any number of contiguous strata of liquids is least when they are arranged in order of density, so that this is the disposition favoured by the attractive forces. The problem is to make the sum of the interfacial tensions a minimum, each tension being proportional to the square of the difference of densities of the two contiguous liquids in question. If the order of stratification differ from that of densities, we can show that each step of approximation to this order lowers the sum of tensions. To this end consider the effect of the abolition of a stratum $\sigma_{n+1}$, contiguous to $\sigma_{n}$ and $\sigma_{n+2}$. Before the change we have $(\sigma_{n} - \sigma_{n+1})^{2} + (\sigma_{n+1} - \sigma_{n+2})^{2}$, and afterwards $(\sigma_{n} - \sigma_{n+2})^{2}$. The second minus the first, or the increase in the sum of tensions, is thus

$$2(\sigma_{n} - \sigma_{n+1})(\sigma_{n+1} - \sigma_{n+2}).$$

Hence, if $\sigma_{n+1}$ be intermediate in magnitude between $\sigma_{n}$ and $\sigma_{n+2}$, the sum of tensions is increased by the abolition of the stratum; but, if $\sigma_{n+1}$ be not intermediate, the sum is decreased. We see, then, that the removal of a stratum from between neighbours where it is out of order and its introduction between neighbours where it will be in order is doubly favourable to the reduction of the sum of tensions; and since by a succession of such steps we may arrive at the order of magnitude throughout, we conclude that this is the disposition of minimum tensions and energy.

So far the results of Laplace's hypothesis are in marked accordance with experiment; but if we follow it out further, discordances begin to manifest themselves. According to (52)

$$V_{12} = V_{13} + V_{23}, \quad \ldots \ldots \ldots \ldots \ldots (53)$$

a relation not verified by experiment. What is more, (52) shows that according to the hypothesis $T_{13}$ is necessarily positive;
so that, if the preceding argument be correct, no such thing as a mixture of two liquids could ever take place.

There are two apparent exceptions to Marangoni's rule which call for a word of explanation. According to the rule, water, which has the lower surface-tension, should spread upon the surface of mercury; whereas the universal experience of the laboratory is that drops of water standing upon mercury retain their compact form without the least tendency to spread. To Quincke belongs the credit of dissipating the apparent exception. He found that mercury specially prepared behaves quite differently from ordinary mercury, and that a drop of water deposited thereon spreads over the entire surface. The ordinary behaviour is evidently the result of a film of grease, which adheres with great obstinacy.

The process described by Quincke is somewhat elaborate; but there is little difficulty in repeating the experiment if the mistake be avoided of using a free surface already contaminated, as almost inevitably happens when the mercury is poured from an ordinary bottle. The mercury should be drawn from underneath, for which purpose an arrangement similar to a chemical wash bottle is suitable, and it might be poured into watch-glasses, previously dipped into strong sulphuric acid, rinsed in distilled water, and dried over a Bunsen flame. When the glasses are cool, they may be charged with mercury, of which the first part is rejected. Operating in this way there is no difficulty in obtaining surfaces upon which a drop of water spreads, although from causes that cannot always be traced, a certain proportion of failures is met with. As might be expected, the grease which produces these effects is largely volatile. In many cases a very moderate preliminary warming of the watch-glasses makes all the difference in the behaviour of the drop.

The behaviour of a drop of carbon bisulphide placed upon clean water is also, at first sight, an exception to Marangoni's rule. So far from spreading over the surface, as according to its lower surface-tension it ought to do, it remains suspended in the form of a lens. Any dust that may be lying upon the surface is not driven away to the edge of the drop, as would happen in the case of oil. A simple modification of the experiment suffices, however, to clear up the difficulty. If after the deposition of the drop, a little lycopodium be scattered over the surface, it is seen that a circular space surrounding the drop, of about the size of a shilling, remains bare, and this, however often the dusting be repeated, so long as any of the carbon bisulphide remains. The interpretation can hardly be doubtful. The carbon bisulphide is really spreading all the while, but on account of its volatility it is unable to reach any considerable distance. Immediately surrounding the drop there is a film moving outwards at a high speed, and this carries away almost instantaneously any dust that may fall upon it. The phenomenon above described requires that the water-surface be clean. If a very little grease be present, there is no outward flow and dust remains undisturbed in the immediate neighbourhood of the drop.

On the Rise of a Liquid in a Tube.—Let a tube (fig. 6) whose internal radius is \( r \), made of a solid substance \( c \), be dipped into a liquid \( a \). Let us suppose that the angle of contact for this liquid with the solid \( c \) is an acute angle. This implies that the tension of the free surface of the solid \( c \) is greater than that of the surface of contact of the solid with the liquid \( a \). Now consider the tension of the free surface of the liquid \( a \). All round its edge there is a tension \( T \) acting at an angle \( \alpha \) with the vertical. The circumference of the edge is \( 2\pi r \); so that the resultant of this tension is a force \( 2\pi r T \cos \alpha \) acting vertically upwards on the liquid. Hence

\[ h = \frac{T}{\rho g} \]

the liquid will rise in the tube till the weight of the vertical column between the free surface and the level of the liquid in the vessel balances the resultant of the surface-tension. The upper surface of this column is not level, so that the height of the column cannot be directly measured, but let us assume that \( h \) is the mean height of the column, that is to say, the height of a column of equal weight, but with a flat top. Then if \( r \) is the radius of the tube at the top of the column, the volume of the suspended column is \( \pi rh \), and its weight is \( \pi T r \cos \alpha \), when \( \rho \) is its density and \( g \) the intensity of gravity. Equating this force with the resultant of the tension

\[ \pi T r \cos \alpha = \rho g h \]

Hence the mean height to which the fluid rises is inversely as the radius of the tube. For water in a clean glass tube the angle of contact is zero, and

\[ h = \frac{T}{\rho g} \]

For mercury in a glass tube the angle of contact is \( 128^\circ 52' \), the cosine of which is negative. Hence when a glass tube is dipped into a vessel of mercury, the mercury within the tube stands at a lower level than outside it.

Rise of a Liquid between Two Plates.—When two parallel plates are placed vertically in a liquid the liquid rises between them. If we now suppose fig. 6 to represent a vertical section perpendicular to the plates, we may calculate the rise of the liquid. Let \( l \) be the breadth of the plates measured perpendicularly to the plane of the paper, then the length of the line which bounds the wet and the dry parts of the plates inside \( l \) for each surface, and on this the tension \( T \) acts at an angle \( \alpha \) to the vertical. Hence the resultant of the surface-tension is \( 2T \cos \alpha \). If the distance between the inner surfaces of the plates is \( a \), and if the mean height of the film of fluid which rises between them is \( h \), the height of fluid raised is \( pg h a \). Equating the forces

\[ pg h a = 2T \cos \alpha \]

whence

\[ h = \frac{T}{\rho g} \]

This expression is the same as that for the rise of a liquid in a tube, except that instead of \( r \), the radius of the tube, we have \( a \) the distance of the plates.

Form of the Capillary Surface.—The form of the surface of a liquid acted on by gravity is easily determined if we assume that near the part considered the line of contact of the surface of the liquid with that of the solid bounding it is straight and horizontal, as it is when the solids which constrain the liquid are bounded by surfaces formed by horizontal and parallel generating lines. This will be the case, for instance, near a flat plate dipped into the liquid. If we suppose these generating lines to be normal to the plane of the paper, then all sections of the solids parallel to this plane will be equal and similar to each other, and the section of the surface of the liquid will be of the same form for all such sections.

Let us consider the portion of the liquid between two parallel sections distant one unit of length. Let \( C_1 \), \( C_2 \) (fig. 7) be two points of the surface; \( \theta \), \( \phi \), \( \varphi \), \( \psi \), the inclinations of the surface to the horizon at \( P_1 \) and \( P_2 \); \( y_1, y_2 \), the heights of \( P_1 \) and \( P_2 \) above the level of the liquid at a distance from all solid bodies. The pressure at any point of the liquid which is above this level is negative unless another fluid as, for instance, the air, presses on the upper surface, but it is only the difference of pressures with which we have to do, because two equal pressures on opposite sides of the surface produce no effect.

We may, therefore, write for the pressure at a height \( y \)

\[ p = -\rho g y \]
where \( \rho \) is the density of the liquid, or if there are two fluids the excess of the density of the lower fluid over that of the upper one.

The forces acting on the portion of liquid \( P_1P_2A_2A_1 \) are—first, the horizontal pressures, \(-\theta \rho g y^2\) and \( \theta \rho g y^2\); second, the surface-tension \( T \) acting at \( P_1 \) and \( P_2 \) in directions inclined \( \theta \) and \( \theta \) to the horizontal. Resolving horizontally we find—

\[
T(\cos \theta - \cos \theta) + \frac{1}{2} \rho g y^2 - \frac{1}{2} \rho g y^2 = 0,
\]

whence

\[
\cos \theta - \cos \theta + \frac{1}{2} \rho g y^2 - \frac{1}{2} \rho g y^2 = 0.
\]

or if we suppose \( P_1 \) fixed and \( P_2 \) variable, we may write

\[
\cos \theta = \text{constant} - \frac{1}{2} \rho g y^2/T.
\]

This equation gives a relation between the inclination of the curve to the horizon and the height above the level of the liquid.

Resolving vertically we find that the weight of the liquid raised above the level must be equal to \( T(\sin \theta - \sin \theta) \), and therefore equal to the area \( P_1P_2A_2A_1 \) multiplied by \( \rho g \). The form of the capillary surface is identical with that of the "elastic curve," or the curve formed by a uniform spring originally straight, when its ends are acted on by equal and opposite forces applied either to the ends themselves or to solid pieces attached to them. Drawings of the different forms of the curve may be found in Thomson and Tait’s *Natural Philosophy*, vol. i. p. 455.

We shall next consider the rise of a liquid between two plates of different materials for which the angles of contact are \( a_1 \) and \( a_2 \), the distance between the plates being \( a \), a small quantity. Since the plates are very near one another we may use the following equation of the surface as an approximation:

\[
y = h_1 + Ax + Be^2, \quad h_1 = h_1 + Ax + Be^2,
\]

whence

\[
\cot a_1 = -A, \quad \cot a_2 = A + 2Ba, \quad T(\cos a_1 + \cos a_2) = \rho g a(1 + \frac{1}{2}Aa + 1Ba^2),
\]

whence we obtain

\[
h_1 = \frac{T}{\rho g a}(\cos a_1 + \cos a_2) + \frac{1}{2}(2 \cot a_1 - \cot a_2)
\]

and

\[
h_2 = \frac{T}{\rho g a}(\cos a_1 + \cos a_2) + \frac{1}{2}(2 \cot a_2 - \cot a_1).
\]

Let \( X \) be the force which must be applied in the horizontal direction to either plate to keep it from approaching the other, then the forces acting on the first plate are \( T + X \) in the negative direction, and \( T \sin a_1 + \frac{1}{2} \rho g h_1^2 \) in the positive direction. Hence

\[
X = \frac{1}{2} \rho g h_1^2 - T(1 - \sin a_1).
\]

For the second plate

\[
X = \frac{1}{2} \rho g h_2^2 - T(1 - \sin a_2).
\]

Hence

\[
X = \frac{1}{2} \rho g (h_1^2 + h_2^2) - T(1 - \frac{1}{2}(\sin a_1 + \sin a_2)),
\]

or, substituting the values of \( h_1 \) and \( h_2 \)

\[
X = \frac{1}{2} \rho g a(\cos a_1 + \cos a_2)^2
\]

\[ - T(1 - \frac{1}{2}(\sin a_1 + \sin a_2)) - \frac{1}{2}(\cos a_1 + \cos a_2)(\cot a_1 + \cot a_2),
\]

the remaining terms being negligible when \( a \) is small. The force, therefore, with which the two plates are drawn together consists first of a positive part, or in other words an attraction, varying inversely as the square of the distance, and second, of a negative part of repulsion independent of the distance. Hence in all cases except that in which the angles \( a_1 \) and \( a_2 \) are supplementary to each other, the force is attractive when \( a \) is small enough, but when \( \cos a_1 \) and \( \cos a_2 \) are of different signs, as when the liquid is raised by one plate, and depressed by the other, the first term may be so small that the repulsion indicated by the second term comes into play. The fact that a pair of plates which repel one another at a certain distance may attract one another at a smaller distance was deduced by Laplace from theory, and verified by the observations of the abbé Haixy.

A Drop between Two Plates.—If a small quantity of a liquid which wets glass be introduced between two glass plates slightly inclined to each other, it will run towards that part where the glass plates are nearest together. When the liquid is in equilibrium it forms a thin film, the outer edge of which is all of the same thickness. If \( d \) is the distance between the plates at the edge of the film and \( \Pi \) the atmospheric pressure, the pressure of the liquid in the film is \( \Pi = \frac{T \cos a}{d} \), and if \( A \) is the area of the film between the plates and \( B \) its circumference, the plates will be pressed together with a force

\[
\frac{2T \cos a + BT \sin a}{d},
\]

and this, whether the atmosphere exerts any pressure or not. The force thus produced by the introduction of a drop of water between two plates is enormous, and is often sufficient to press certain parts of the plates together so powerfully as to bruise them or break them. When two blocks of ice are placed loosely together so that the superfluous water which melts from them may drain away, the remaining water draws the blocks together with a force sufficient to cause the blocks to adhere by the process called *Regulation*.

An effect of an opposite character may be observed when the fluid is mercury in place of water. When two pieces of flat glass are pressed together under moderate force they cohere, the mercury leaving the narrow crevasses, even although the alternative is a vacuum. The course of events is more easily followed if one of the pieces of glass constitutes the bottom, or a side, of the vessel containing the mercury.

In many experiments bodies are floated on the surface of water in order that they may be free to move under the action of slight horizontal forces. Thus Sir Isaac Newton placed a magnet in a floating vessel and a piece of iron in another in order to observe their mutual action, and A.M. Ampère floated a voltaic battery in a vessel with a coil of wire in its circuit in order to observe the effects of the earth’s magnetism on the electric circuit. When such floating bodies come near the edge of the vessel they are drawn up to it, and are apt to stick fast to it. There are two ways of avoiding this inconvenience. One is to grease the float round its water-line so that the water is depressed round it. This, however, often produces a worse disturbing effect, because a thin film of grease spreads over the water and increases its surface-viscosity. The other method is to fill the vessel with water till the level of the water stands a little higher than the rim of the vessel. The float will then be repelled from the edge of the vessel. Such floats, however, should always be made so that the section taken at the level of the water is as small as possible.

The Size of Drops.—The relation between the diameter of a tube and the weight of the drop which it delivers appears to have been first investigated by Thomas Tate (*Phil. Mag. vol. xxvii. p. 175, 1864*), whose experiments led him to the conclusion that "other things being the same, the weight of a drop of liquid is proportional to the diameter of the tube in which it is formed."

Sufficient time must of course be allowed for the formation of the drops; otherwise no simple results can be expected. In Tate’s experiments the period was never less than 40 seconds.

The magnitude of a drop delivered from a tube, even when the formation up to the phase of instability is infinitely slow, cannot be calculated a priori. The weight is sometimes equated to the product of the capillary tension (\( T \)) and the circumference of the tube (\( \pi a \)), but with little justification. Even if the tension at the circumference of the tube acted vertically, and the whole of the liquid below this level passed into the drop, the calculation would still be vitiated by the assumption that the internal pressure at the level in question is atmospheric.

It would be necessary to consider the curvatures of the fluid surface at the edge of attachment. If the surface could be treated as a cylindrical prolongation of the tube (radius of the pressure would be \( T/a \), and the resulting force acting downwards upon the drop would amount to one-half (\( \pi T \)) of the direct upward pull of the tension along the circumference. At this
rate the drop would be but one-half of that above reckoned. But the truth is that a complete solution of the statical problem for all forms up to that at which instability sets in, would not suffice for the present purpose. The detachment of the drop is a dynamical effect, and it is influenced by collateral circumstances. For example, the bore of the tube is no longer a matter of indifference, even though the attachment of the drop occurs entirely at the outer edge. It appears that when the external diameter exceeds a certain value, the weight of a drop of water is sensibly different in the two extreme cases of a very small and of a very large bore.

But although a complete solution of the dynamical problem is impracticable, much interesting information may be obtained from the principle of dynamical similarity. The argument has already been applied by Dupré (Théorie mécanique de la chaleur, Paris, 1869, p. 328), but his presentation of it is rather obscure. We will assume that when, as in most cases, viscosity may be neglected, the mass (M) of a drop depends only upon the density (a), the capillary tension (T), the acceleration of gravity (g), and the linear dimension of the tube (a). In order to justify this assumption, the formation of the drop must be sufficiently slow, and certain restrictions must be imposed upon the shape of the tube. For example, in the case of water delivered from a glass tube, which is cut off square and held vertically, a will be the external radius; and it will be necessary to suppose that the ratio of the internal radius to a is constant, the cases of a ratio infinitely small or, infinitely near unity, being included. But if the fluid be mercury, the flat end of the tube remains unwetted, and the formation of the drop depends upon the internal diameter only.

The "dimensions" of the quantities on which M depends are:

\[ \sigma = (\text{Mass}) (\text{Length})^{-1} \]

\[ T = (\text{Force}) (\text{Length})^{-1} = (\text{Mass}) (\text{Time})^{-1} \]

\[ g = \text{Acceleration} = (\text{Length}) (\text{Time})^{-2} \]

of which M, a mass, is to be expressed as a function. If we assume

\[ M \propto T^a g^a \sigma^a \]

we have, considering in turn length, time and mass,

\[ y - 3z + u = 0, \quad 2x + 2y = 0, \quad x + z = 1; \]

so that

\[ y = -z, \quad x = 1 - z, \quad u = 3 - 2x \]

Accordingly

\[ M \propto \frac{T^a g^a}{\sigma^a} \]

Since \( x \) is undetermined, all that we can conclude is that M is of the form

\[ M = \frac{T^a g^a}{\sigma^a} \]

where F denotes an arbitrary function.

Dynamical similarity requires that \( T/ga^2 \) be constant; or, if \( g \) be supposed to be so, that \( a^2 \) varies as \( T/\sigma \). If this condition be satisfied, the mass (or weight) of the drop is proportional to T and to \( a^2 \).

If Tate's law be true, that \textit{ceteris paribus} \( M \) varies as \( a \), it follows from (1) that \( F \) is constant. For all fluids and for all similar tubes similarly wetted, the weight of a drop would then be proportional not only to the diameter of the tube, but also to the superficial tension, and it would be independent of the density.

Careful observations with special precautions to ensure the cleanliness of the water have shown that over a considerable range, the departure from Tate's law is not great. The results give material for the determination of the function F in (1).

In the preceding table, applicable to thin-walled tubes, the first column gives the values of \( T/ga^2 \), and the second column those of \( gM/Ta \). All the quantities concerned being in C.G.S. measure, or other consistent system. From this the weight of a drop of any liquid of which the density and surface tension are known, can be calculated. For many purposes it may suffice to treat \( F \) as a constant, say 3.8. The formula for the weight of a drop is then simply

\[ Mg = 3.8Ta \]

in which 3.8 replaces the \( \sigma \) of the faulty theory alluded to earlier (see Rayleigh, Phil. Mag., Oct. 1891.)

\textbf{Phenomena arising from the Variation of the Surface-tension.}

Pure water has a higher surface-tension than that of any other substance liquid at ordinary temperatures except mercury. Hence any other liquid if mixed with water diminishes its surface-tension. For example, if a drop of alcohol be placed on the surface of water, the surface-tension will be diminished from 80, the value for pure water, to 25, the value for pure alcohol. The surface of the liquid will therefore no longer be in equilibrium, and a current will be formed and near the surface from the alcohol to the surrounding water, and this current will go on as long as there is more alcohol at one part of the surface than at another. If the vessel is deep, these currents will be balanced by counter currents below them, but if the depth of the water is only two or three millimetres, the surface-current will sweep away the whole of the water, leaving a dry spot where the alcohol was dropped in. This phenomenon was first described and explained by James Thomson, who also explained a phenomenon, the converse of this, called the "tears of strong wine."

If a wine-glass be half-filled with port wine the liquid rises a little up the side of the glass as other liquids do. The wine, however, contains alcohol and water, both of which evaporate, but the alcohol faster than the water, so that the superficial layer becomes more watery. In the middle of the vessel the superficial layer recovers its strength by diffusion from below, but the film adhering to the side of the glass becomes more watery, and therefore has a higher surface-tension than the surface of the stronger wine. It therefore creeps up the side of the glass dragging the strong wine after it, and this goes on till the quantity of fluid dragged up collects into a drop and runs down the side of the glass.

The motion of small pieces of camphor floating on water arises from the gradual solution of the camphor. If this takes place more rapidly on one side of the piece of camphor than on the other side, the surface-tension becomes weaker where there is most camphor in solution, and the lump, being pulled unequally by the surface-tensions, moves off in the direction of the strongest tension, namely, towards the side on which least camphor is dissolved.

If a drop of ether is held near the surface of water the vapour of ether condenses on the surface of the water, and surface-currents are formed flowing in every direction away from under the drop of ether.

If we place a small floating body in a shallow vessel of water and wet one side of it with alcohol or ether, it will move off with great velocity and skim about on the surface of the water, the part of the body being always in the strongest tension, and the surface-tension of the liquid being altered by slight changes in the state of the surface. The surface-tension of pure mercury is so great that it is very difficult to keep it clean, for every kind of oil or grease spreads over it at once.

But the most remarkable effects of change of surface-tension are those produced by what is called the electric polarization of the surface. The tension of the surface of contact of mercury and dilute sulphuric acid depends on the electromotive force acting between the mercury and the acid. If the electromotive force is from the acid to the mercury the surface-tension increases; if it is from the mercury to the acid, it diminishes. Faraday observed that a large drop of mercury, resting on the flat bottom of a vessel containing dilute acid, changes its form in a remarkable way when connected with one of the electrodes of a battery, the other electrode being placed in the acid. When the mercury
is made positive it becomes dull and spreads itself out; when it is made negative it gathers itself together and becomes bright again. O. Lippmann, who has made a careful investigation of the subject, finds that exceedingly small variations of the electromotive force produce sensible changes in the surface-tension. The effect of one of a Daniell's cell is to increase the tension from 30-4 to 40-6. He has constructed a capillary electrometer by which differences of electric potential less than 0-01 of that of a Daniell's cell can be detected by the difference of the pressure required to force the mercury to a given point of a fine capillary tube. He has also constructed an apparatus in which this variation in the surface-tension is made to do work and drive a machine. He has also found that this action is reversible, for when the area of the surface of contact of the acid and mercury is made to increase, an electric current passes from the mercury to the acid, the amount of electricity which passes while the surface increases by one square centimetre being sufficient to decompose 600013 grammes of water.

The movements of camphor scrapings referred to above afford a useful test of the condition of a water surface. If the contamination exceeded a certain limit, the scrapings remain quite dead. In a striking form of the experiment, the water is contained, to the depth of perhaps one inch, in a large flat dish, and the operative part of the surface is limited by a flexible hoop of thin sheet brass lying in the dish and rising above the water-level. If the hoop enclose an area of (say) one-third of the maximum, and if the water be clean, camphor fragments floating on the interior enter with vigorous movements. A touch of the finger will then often reduce them to quiet; but if the hoop be expanded, the included grease is so far attenuated as to lose its effect. Another method of removing grease is to immerse and remove strips of paper by which the surface available for the contamination is in effect increased.

The thickness of the film of oil adequate to check the camphor movements can be determined with fair accuracy by depositing a weighed amount of oil (such as 8 mg.) upon the surface of water in a large dish. Calculated as if the density were the same as in a normal state, the thickness of the film is found to be about two millionths of a millimetre. Small as is the above amount of oil, the camphor test is a comparatively coarse one. Conditions of a contaminated surface may be distinctly observed, upon all of which camphor fragments spin vigorously. Thus, a shallow tin vessel, such as the lid of a biscuit box, may be levelled and filled with tap-water through a rubber hose. Upon the surface of the water a little sulphur is dusted. An application of the finger for 20 or 30 seconds to the under surface of the vessel will then generate enough heat to lower appreciably the surface-tension, as is evidenced by the opening out of the dust and the formation of a bare spot perhaps 1/4 in. in diameter. When, however, the surface is but very slightly greased, a spot can no longer be cleared by the warmth of the finger, or even of a spirit lamp, held underneath. And yet the greasing may be so slight that camphor fragments move with apparently unabated vigour.

The varying degrees of contamination to which a water surface is subject are the cause of many curious phenomena. Among these is the superficial viscosity of Plateau. In his experiments a long compass needle is mounted so as to swing in the surface of the liquid under investigation. The cases of ordinary clean water and alcohol are strongly contrasted, the motion of the needle upon the former being comparatively sluggish. Moreover, a different behaviour is observed when the surfaces are slightly dusted over. In the case of water the whole of the surface in front of the needle moves with it, while on the other hand the dust floating on alcohol is scarcely disturbed until the needle actually strikes it. Plateau attributed these differences to a special quality of the liquids, named by him "superficial viscosity." It has been proved, however, that the question is one of contamination, and that a water surface may be prepared so as to behave in the same manner as alcohol.

Another consequence of the tendency of a moderate contamination to distribute itself uniformly is the calming effect of oil, investigated by B. Franklin. On pure water the propagation of waves would be attended by temporary extensions and contractions of the surface, but these, as was shown by O. Reynolds, are resisted when the surface is contaminated.

Indeed the possibility of the continued existence of films, such as constitute foam, depends upon the properties now under consideration. If, as is sometimes stated, the tension of a vertical film were absolutely the same throughout, the middle parts would of necessity fall with the acceleration of gravity. In reality, the tension adjusts itself automatically to the weight to be supported at the various levels.

Although throughout a certain range the surface-tension varies rapidly with the degree of contamination, it is remarkable that, as was first fully indicated by Miss Pockells, the earlier stages of contamination have little or no effect upon surface-tension. Lord Rayleigh has shown that the fall of surface-tension begins when the quantity of oil is about the half of that required to stop the camphor movements, and he suggests that this stage may correspond with a complete coating of the surface with a single layer of molecules.

On the Forms of Liquid Films which are Figures of Revolution.—A soap bubble is simply a small quantity of soap-suds spread out so as to expose a large surface to the air. The bubble, in fact, has two surfaces, an outer and an inner surface, both exposed to the air. It has, therefore, a certain amount of surface-energy depending on the area of these two surfaces. Since in the case of thin films the outer and inner surfaces are approximately equal, we shall consider the area of the film as representing either of them, and shall use the symbol T to denote the energy of unit area of the film, both surfaces being taken together. If T' is the energy of a single surface of the liquid, T the energy of the film is $2T'$. When by means of a tube we blow air into the inside of the bubble we increase its volume and therefore its surface, and at the same time we do work in forcing air into it, and thus increase the energy of the bubble.

That the bubble has energy may be shown by leaving the end of the tube open. The bubble will contract, forcing the air out, and the current of air blown through the tube may be made to deflect the flame of a candle. If the bubble is in the form of a sphere of radius r this material surface will have an area

$$S = 4\pi r^2 \quad (1)$$

If T be the energy corresponding to unit area of the film the surface-energy of the whole bubble will be

$$ST' = 4\pi r^2 T \quad (2)$$

The increment of this energy corresponding to an increase of the radius from r to $r + dr$ is therefore

$$Tds = 8\pi r dr \quad (3)$$

Now this increase of energy was obtained by forcing air at a pressure greater than the atmospheric pressure, and thus increasing the volume of the bubble.

Let $P$ be the atmospheric pressure and $P + \rho$ the pressure of the air within the bubble. The volume of the sphere is

$$V = \frac{4}{3}\pi r^3 \quad (4)$$

and the increment of volume is

$$dV = 4\pi r^2 dr \quad (5)$$

Now if we suppose a quantity of air already at the pressure $P + \rho$, the work done in forcing it into the bubble is $\rho dV$. Hence the equation of work and energy is

$$\rho dV = Tds \quad (6)$$

or

$$4\pi r^2 \rho dr = 8\pi r dr T \quad (7)$$

or

$$\rho = \frac{2T}{r} \quad (8)$$

This, therefore, is the excess of the pressure of the air within the bubble over that of the external air, and it is due to the action of the inner and outer surfaces of the bubble. We may conceive this pressure to arise from the tendency which the bubble has to contract, or in other words from the surface-tension of the bubble.

If to increase the area of the surface requires the expenditure
of work, the surface must resist extension, and if the bubble in contracting can do work, the surface must tend to contract. The surface must therefore act like a sheet of india-rubber when extended both in length and breadth, that is, it must exert surface-tension. The tension of the sheet of india-rubber, however, depends on the extent to which it is stretched, and may be different in different directions, whereas the tension of the surface of a liquid remains the same however much the film is extended, and the tension at any point is the same in all directions.

The intensity of this surface-tension is measured by the stress which it exerts across a line of unit length. Let us measure it in the case of the spherical soap-bubble by considering the stress exerted by one hemisphere of the bubble on the other, across the circumference of a great circle. This stress is balanced by the pressure $p$ acting over the area of the same great circle: it is therefore equal to $2\pi p$. To determine the intensity of the surface-tension we have to divide this quantity by the length of the line across which it acts, which is in this case the circumference of a great circle $2\pi r$. Dividing $2\pi p$ by this length we obtain $\frac{1}{2}pr$ as the value of the intensity of the surface-tension, and it is plain from equation 8 that this is equal to $T$. Hence the numerical value of the intensity of the surface-tension is equal to the numerical value of the surface-energy per unit of surface. We must remember that since the film has two surfaces the surface-tension of the film is double the tension of the surface of the liquid of which it is formed.

To determine the relation between the surface-tension and the pressure which balances it when the form of the surface is not spherical, let us consider the following case:

Let fig. 9 represent a section through the axis $CC'$ of a soap-bubble in the form of a figure of revolution bounded by two circular disks $AB$ and $CD$, and having the meridian section $AP$. Let PQ be an imaginary section normal to the axis. Let the radius of this section PR by $y$, and let PT, the tangent at $P$, make an angle $\alpha$ with the axis.

Let us consider the stresses which are exerted across this imaginary section by the lower part on the upper part. If the internal pressure exceeds the external pressure by $p$, there is in the first place a force $2\pi r p$ acting upwards arising from the pressure $p$ over the area of the section. In the next place, there is the surface-tension acting downwards, but at an angle $\alpha$ with the vertical, across the circular section of the bubble itself, whose circumference is $2\pi r$, and the downward force is therefore $2\pi r T \cos \alpha$.

Now these forces are balanced by the external force which acts on the disk $ABC$, which we may call $F$. Hence equating the forces which act on the portion included between $ABC$ and $PRQ$

$$2\pi p r - 2\pi r T \cos \alpha = -F \ldots \ldots \ldots (9).$$

If we make $CR = z$, and suppose $s$ to vary, the shape of the bubble of course remaining the same, the values of $y$ and of $\alpha$ will change, but the other quantities will be constant. In studying these variations we may if we please take as our independent variable the length $s$ of the meridian section $AP$ reckoned from A. Differentiating equation 9 with respect to $s$ we obtain, after dividing by $2\pi$ as a common factor,

$$\frac{dy}{ds} T \cos \alpha \frac{dy}{ds} + Ty \sin \alpha \frac{da}{ds} = 0 \ldots \ldots \ldots (10).$$

Now

$$\frac{dy}{ds} = \sin \alpha \ldots \ldots \ldots \ldots \ldots (11).$$

The radius of curvature of the meridian section is

$$R_1 = \frac{ds}{da} \ldots \ldots \ldots \ldots \ldots (12).$$

The radius of curvature of a normal section of the surface at right angles to the meridian section is equal to the part of the normal cut off by the axis, which is

$$R_2 = \frac{PN}{y} \cos \alpha \ldots \ldots \ldots (13).$$

Hence dividing equation 10 by $y \sin \alpha$, we find

$$\frac{dy}{ds} T \cos \alpha = -F \frac{y}{2\pi p r} \ldots \ldots \ldots (14).$$

This equation, which gives the pressure in terms of the principal radii of curvature, though here proved only in the case of a surface of revolution, must be true of all surfaces. For the curvature of any surface at a given point may be completely defined in terms of the positions of its principal normal sections and their radii of curvature.

Before going further we may deduce from equation 9 the nature of all the figures of revolution which a liquid film can assume. Let us first determine the nature of a curve, such that if it is rolled on the axis its origin will trace out the meridian section of the bubble. Since at any instant the rolling curve is rotating about the point of contact with the axis, the line drawn from this point of contact to the tracing point must be normal to the direction of motion of the tracing point. Hence if $N$ is the point of contact, $NP$ must be normal to the traced curve. Also, since the axis is a tangent to the rolling curve, the ordinate $PR$ is the perpendicular from the tracing point $P$ on the tangent.

Hence the relation between the radius vector and the perpendicular to the tangent of the rolling curve can be made identical with the relation between the normal $PN$ and the ordinate $PR$ of the traced curve. If we write $r$ for $PN$, then $y = r \cos \alpha$, and equation 9 becomes

$$y^2 \left( \frac{2}{pr} - 1 \right) = \frac{F}{\pi p r}.$$

This relation between $y$ and $r$ is identical with the relation between the perpendicular from the focus of a conic section on the tangent at a given point and the focal distance of that point, provided the transverse and conjugate axes of the conic are $2a$ and $2b$ respectively, where

$$a = \frac{T}{p} \quad \text{and} \quad 2b = \frac{F}{\pi p r}.$$

Hence the meridian section of the film may be traced by the focus of such a conic, if the conic is made to roll on the axis.

On the Different Forms of the Meridian Line. 1. When the conic is an ellipse the meridian line is in the form of a series of waves, and the film itself has a series of alternate swellings and contractions as represented in figs. 9 and 10. This form of the film is called the unduloid.

1a. When the ellipse becomes a circle, the meridian line becomes a straight line parallel to the axis, and the film passes into the form of a cylinder of revolution.

1b. As the ellipse degenerates into the straight line joining its foci, the contracted parts of the unduloid become narrower, till at last the figure becomes a series of spheres in contact.

In all these cases the internal pressure exceeds the external by $2\pi a$ where $a$ is the semi-transverse axis of the conic. The resultant of the internal pressure and the surface-tension is equivalent to a tension along the axis, and the numerical value of this tension is equal to the force due to the action of this pressure on a circle whose diameter is equal to the conjugate axis of the ellipse.

2. When the conic is a parabola the meridian line is a catenary (fig. 11); the internal pressure is equal to the external pressure, and the tension along the axis is equal to $2\pi T m$ where $m$ is the distance of the vertex from the focus.

3. When the conic is a hyperbola the meridian line is in the form of a looped curve (fig. 12). The corresponding figure of the film is called the nodoid. The resultant of the internal pressure and the surface-tension is equivalent to a pressure along the axis equal to that due to a pressure $a^2$ acting on a circle whose diameter is the conjugate axis of the hyperbola.

When the conjugate axis of the hyperbola is made smaller and smaller, the nodoid approaches more and more to the series of spheres touching each other along the axis. When the conjugate axis of the hyperbola increases without limit, the loops of the nodoid are crowded on one another, and each becomes more nearly a ring of circular section, without, however, ever
reaching this form. The only closed surface belonging to the series is the sphere.

The figures of revolution have been studied mathematically by C. W. Boisson, 1 Goldestadt, 2 L. L. Lindalé and F. M. N. Moigno, 3 C. E. Delaunay, 4 A. H. E. Lamare, 5 A. Beer, 6 and V. M. A. Mannheim, 7 and have been produced experimentally by Plateau 8 in the two different ways already described.

Fig. 10.—Unduloid. Fig. 11.—Catenoid. Fig. 12.—Nodoid.

The limiting conditions of the stability of these figures have been studied both mathematically and experimentally. We shall notice only two of them, the cylinder and the catenoid.

Stability of the Cylinder.—The cylinder is the limiting form of the unduloid when the rolling ellipse becomes a circle. 

When the ellipse differs infinitely little from a circle, the equation of the meridian line becomes approximately \( y = \sigma + c \sin (a \alpha) \) where \( c \) is small. This is a simple harmonic wave line, whose mean distance from the axis is \( c \), whose wave-length is \( 2\pi a \), and whose amplitude is \( c \). The internal pressure corresponding to this unduloid is as before \( \rho = T/\alpha \).

Now consider a portion of a cylindrical film of length \( \pi \) terminated by two equal disks of radius \( r \) and containing a certain volume of air. Let one of these disks be made to approach the other by a small quantity \( dx \). The film will swell out into the convex part of an unduloid, having its largest section midway between the disks, and we have to determine whether the internal pressure will be greater or less than before. If \( A \) and \( C \) (fig. 13) are the disks, and if \( x \) be the distance between the disks it is equal to \( \pi r \) half the wave-length of the harmonic curve, the disks will be at the points where the curve reaches its mean distance from the axis, and the pressure will therefore be \( T/r \) as before. If \( A, C \), are the disks, so that the distance between them is less than \( \pi r \), the curve must be produced beyond the disks before it is at its mean distance from the axis. Hence in this case the mean distance is less than \( r \), and the pressure will be greater than \( T/r \). If, on the other hand, the disks are at \( A \) and \( C \), so that the distance between them is greater than \( \pi r \), the curve will reach its mean distance from the axis before it reaches the disks. The mean distance will therefore be greater than \( r \), and the pressure will be less than \( T/r \). Hence if one of the disks is made to approach the other, the internal pressure will be increased if the distance between the disk is less than half the circumference of either, and the pressure will be diminished if the distance is greater than this quantity. In the same way we may show that if the distance between the disks is increased, the pressure will be diminished or increased according as the distance is less or more than half the circumference of either.

Now let us consider a cylindrical film contained between two equal fixed disks, \( A \) and \( B \), and let three disk, \( C \), be placed midway between. Let \( C \) be slightly displaced towards \( A \). If \( A \) and \( C \) are less than half the circumference of a disk the pressure on \( C \) will increase on the side of \( A \) and diminish on the side of \( B \). The resultant force on \( C \) will therefore tend to oppose the displacement and to bring it back to its original position. The equilibrium of \( C \) is therefore stable. It is easy to show that if \( C \) had been placed in any other position than the middle, its equilibrium would have been stable. Hence the film is stable as regards longitudinal displacements. It is also stable as regards displacements transverse to the axis, for the film is in a state of tension, and any lateral displacement of its middle parts would produce a resultant force tending to restore the film to its original position. Hence if the length of the cylindrical film is less than its circumference, it is in stable equilibrium. But if the length of the cylindrical film is greater than its circumference, and if we suppose the disk \( C \) to be placed midway between \( A \) and \( B \), and to be moved towards \( A \), the pressure on the side next to \( A \) will diminish, and that on the side next to \( B \) will increase, so that the resultant force will tend to increase the displacement, and the equilibrium of the disk \( C \) is therefore unstable. Hence the equilibrium of a cylindrical film whose length is greater than its circumference is unstable. Such a film, if ever so little disturbed, will begin to contract at one section and to expand at another, till its form ceases to resemble a cylinder, if it does not break up into two parts which become approximately portions of spheres.

Instability of a Jet of Liquid.—When a liquid flows out of a vessel through a circular opening in the bottom of the vessel, the form of the stream is at first nearly cylindrical though its diameter gradually diminishes from the orifice downwards, because the lower parts are moving faster than the upper parts. The resistance of the air produces little disturbance until the velocity becomes very great. But the surface-tension, acting on a cylindrical column of liquid whose length exceeds the limit of stability, begins to produce enlargements and contractions in the stream as soon as the liquid has left the orifice, and these inequalities in the figure of the column go on increasing till it is broken up into elongated fragments. These fragments as they are travelling through the air continue to be acted on by surface-tension. They therefore shorten themselves, and after a series of oscillations in which they become alternately elongated and flattened, settle down into the form of spherical drops.

This process, which we have followed as it takes place on an individual portion of the falling liquid, goes through its several phases at different distances from the orifice, so that if we examine different portions of the stream as it descends, we shall find next the orifice the unbroken column, then a series of contractions and enlargements, then elongated drops, then flattened drops, and so on till the drops become spherical.

The circumstances attending the resolution of a cylindrical jet into drops were admirably examined and described by F. Savart ("Mémoire sur la constitution des veines liquides lâchées par des orifices circulaires en minces parois," Ann. d. Chim., t. iii., 1853) and for the most part explained with great accuracy by Plateau. Let us conceive an infinitely long circular cylinder of liquid, at rest, its axis parallel to the direction of the fluid, and that part of the fluid is necessarily without influence upon the stability, and may therefore be left out of account for convenience of conception and expression), and inquire under what circumstances it is stable or unstable, for small displacements, symmetrical about the axis of figure.

Whatever the deformation of the originally straight boundary of the axial section may be, it can be resolved by Fourier's theorem into deformations of the harmonic type. These component deformations are in general infinite in number, of very wave-length and of arbitrary phase; but in the first stages of the motion, with which alone we are at present concerned, each produces its effect independently of everything else, and may be considered by itself. Suppose, therefore, that the equation of the boundary is

\[
r = a + c \cos \theta, \quad \cdots \cdots \cdots \quad (1)
\]

where \( a \) is a small quantity, the axis of \( \theta \) being that of symmetry.
The wave-length of the disturbance may be called \( \lambda \), and is connected with \( k \) by the equation \( k = \pi \alpha / \lambda \). The capillary tension endeavours to contract the surface of the fluid, so that the stability, or instability, of the cylindrical form of equilibrium depends upon whether the surface (enclosing a given volume) be greater or less respectively after the displacement than before. It has been proved by Plateau (vide supra) that the surface is greater than before displacement if \( ka > 1 \), that is, if \( \lambda < 2 \pi r \); but less if \( ka < 1 \), or \( \lambda > 2 \pi r \). Accordingly, the equilibrium is stable if \( \lambda \) be less than the circumference; but unstable if \( \lambda \) be greater than the circumference of the cylinder. Disturbances of the former kind lead to vibrations of harmonic type, whose amplitudes always remain small; but disturbances, whose wave-length exceeds the circumference, result in a greater and greater departure from the cylindrical figure. The analytical expression for the motion in the latter case involves exponential terms, one of which (except in case of a particular relation between the initial displacements and velocities) increases rapidly, being equally multiplied in equal times. The coefficient \( q \) of the time in the exponential term \( e^{qt} \) may be considered to measure the degree of dynamical instability; its reciprocal \( 1/q \) is the time in which the disturbance is multiplied in the ratio \( 1 : 2 \).

The degree of instability, as measured by \( q \), is not to be determined from statistical considerations only; otherwise there would be no limit to the increasing efficiency of the longer wave-lengths. The joint operation of superficial tension and inertia in fixing the wave-length of maximum instability was first considered by Lord Rayleigh in a paper (Math. Soc. Proc., November 1878) on the "Instability of Jets." It appears that the value of \( q \) may be expressed in the form

\[
q = \sqrt{\left( \frac{T}{\rho d} \right) r} \quad \text{F (ka),} \\
\text{F (ka) = \cdots \cdots (2)}
\]

where, as before, \( T \) is the superficial tension, \( \rho \) the density, and \( F \) is given by the following table:

<table>
<thead>
<tr>
<th>( k\alpha )</th>
<th>( F/\alpha )</th>
<th>( k\alpha^2 )</th>
<th>( F (ka) )</th>
</tr>
</thead>
<tbody>
<tr>
<td>-0.5</td>
<td>1536</td>
<td>2</td>
<td>3382</td>
</tr>
<tr>
<td>-1</td>
<td>2108</td>
<td>3</td>
<td>3432</td>
</tr>
<tr>
<td>-2</td>
<td>2794</td>
<td>5</td>
<td>3344</td>
</tr>
<tr>
<td>-3</td>
<td>3182</td>
<td>9</td>
<td>2701</td>
</tr>
</tbody>
</table>

The greatest value of \( F \) thus corresponds, not to zero value of \( k\alpha^2 \), but approximately to \( k\alpha^2 = 0.4858 \), or to \( \lambda = 4.508 \times 2 \alpha \). Hence the maximum instability occurs when the wave-length of disturbance is about half as great again as that at which instability first commences.

Taking for water, in C.G.S. units, \( T = 81, \rho = 1 \), we get for the case of maximum instability

\[
q = \sqrt{\frac{81 \times 343}{\alpha^2}} = \frac{115d^3}{1} \quad \text{F (ka) = \cdots \cdots (3)}
\]

if \( d \) be the diameter of the cylinder. Thus, if \( d = 1, q^2 = 1.152 \). For or a diameter of one centimetre the disturbance is multiplied 2.7 times in about one-ninth of a second. If the disturbance be multiplied 1000 fold in time, \( q = 3.590, 10 = 6.9 \), so that \( t = 7.9d^2 \). For example, if the diameter be one millimetre, the disturbance is multiplied 1000 fold in about one-fourth of a second. In view of these estimates the rapid disintegration of a fine jet of water will not cause surprise.

The relative importance of two harmonic disturbances depends upon their initial magnitudes, and upon the rate at which they grow. When the initial values are very small, the latter consideration is much the more important; for, if the disturbances are represented by \( a_1 e^{\alpha_1 t} \), \( a_2 e^{\alpha_2 t} \), in which \( q_1 \) exceeds \( q_2 \), their ratio is \( (a_1 a_2)/e^{(a_1 - a_2) t} \); and this ratio decreases without limit with the time, whatever be the internal (finite) ratio \( a_1 : a_2 \). If the initial disturbances are small enough, that one is ultimately preponderant for which the measure of instability is greatest.

The smaller the causes by which the original equilibrium is upset, the more will the cylindrical mass tend to divide itself regularly into portions whose length is equal to about 4.5 times the diameter. But a disturbance of less favourable wave-length may gain the preponderance in case its magnitude be sufficient to produce disintegration in a length of time less than that required by the other disturbances to present.

The application of these results to actual jets presents no great difficulty. The disturbances by which equilibrium is upset are impressed upon the fluid as it leaves the aperture, and the continuous portion of the jet represents the distance travelled during the time necessary to produce disintegration. Thus the length of the continuous portion necessarily depends upon the character of the disturbances in respect of amplitude and wave-length. It may be increased considerably, as F. Savart showed, by a suitable isolation of the reservoir from tremors, whether due to external sources or to the impact of the jet itself in the vessel placed to receive it. Nevertheless it does not appear to be possible to carry the prolongation very far. Whether the residuary disturbances are of external origin, or are due to friction, or to some peculiarity of the fluid motion within the reservoir, has not been satisfactorily determined. On this point Plateau's explanations are not very clear, and he sometimes expresses himself as if the time of disintegration depended only upon the capillary tension, without reference to initial disturbances at all.

The laws were formulated by Savart with respect to the length of the continuous portion of a jet, and have been to a certain extent explained by Plateau. For a given fluid and a given orifice the length is approximately proportional to the square root of the head. This follows at once from theory, if it can be assumed that the disturbances remain always of the same character, so that the time of disintegration is constant. When the head is given, Savart found the length to be proportional to the diameter of the orifice. From (3) it appears that the time in which a disturbance is multiplied in a given ratio varies, not as \( d \), but as \( d^3 \). Again, when the fluid is changed, the time varies as \( \rho T^{-2} \). But it may be doubted whether the length of the continuous portion obeys any very simple laws, even when external disturbances are avoided as far as possible.

When the circumstances of the experiment are such that the reservoir is influenced by the shocks due to the impact of the jet, the disintegration usually establishes itself with complete regularity, and is attended by a musical note (Savart). The impact of the regular series of drops which is at any moment striking the sink (or vessel receiving the water), determines the rupture into similar drops of the portion of the jet at the same moment passing the orifice. The pitch of the note, though not absolutely definite, cannot differ much from that which corresponds to the division of the jet into wave-lengths of maximum instability; and, in fact, Savart found that the frequency was directly as the square root of the head, inversely as the diameter of the orifice, and independent of the nature of the fluid—laws which follow immediately from Plateau's theory.

From the pitch of the note due to a jet of given diameter, and issuing under a given head, the wave-length of the nascent divisions can be at once deduced. Reasoning from some observations by Savart, Plateau finds in this way 4.38 as the ratio of the length of a division to the diameter of the jet. The diameter of the orifice was 3 millims., from which that of the jet is deduced by the introduction of the coefficient \( 8 \). Now that the length of a division has been estimated a priori, it is perhaps preferable to reverse Plateau's calculation, and to exhibit the frequency of vibration in terms of the other data of the problem. Thus

\[
\text{frequency} = \sqrt{\frac{2(\sqrt{8})}{4.380d^3}} \quad \text{F (ka) = \cdots \cdots (4)}
\]

But the most certain method of obtaining complete regularity of resolution is to bring the reservoir under the influence of an external vibrator, whose pitch is approximately the same as that proper to the jet. H. G. Magnus (Pogg. Ann. cxi., 1859) employed a Neef's hammer, attached to the wooden frame which supported the reservoir. Perhaps an electrically maintained tuning-fork is still better. Magnus showed that the most important part of the effect is due to the forced vibration of that side of the vessel which contains the orifice, and that but little
CAPILLARY ACTION

of it is propagated through the air. With respect to the limits of pitch, Savart found that the note might be a fifth above, and more than an octave below, that proper to the jet. According to theory, there would be no well-defined lower limit; on the other side, the external vibration cannot be efficient if it tends to produce divisions whose length is less than the circumstance of the jet. This would give for the interval defining the upper limit \( \pi \cdot 4:508 \), which is very nearly a fifth. In the case of Plateau's numbers (\( \pi \cdot 4:38 \)) the discrepancy is a little greater.

The detached masses into which a jet is resolved do not at once assume and retain a spherical form, but execute a series of vibrations, being alternately compressed and elongated in the direction of the axis of symmetry. When the resolution is effected in a perfectly periodic manner, each drop is in the same phase of its vibration as it passes through a given point of space; and thence arises the remarkable appearance of alternate swellings and contractions described by Savart. The interval from one swelling to the next is the space described by the drop during one complete vibration, and is therefore (as Plateau shows) proportional ceteris paribus to the square root of the head.

The time of vibration is of course itself a function of the nature of the medium, and also the dimensions of the drops. By observing the time for different dimensions alone it may be seen that the time of infinitely small vibrations varies directly as the square root of the mass of the sphere and inversely as the square root of the capillary tension; and it may be proved that its expression is

\[
\tau = \sqrt{\frac{3\pi V}{81}}, \quad \ldots \ldots \ldots (5)
\]

\( V \) being the volume of the vibrating mass.

In consequence of the rapidity of the motion some optical device is necessary to render apparent the phenomena attending the disintegration of a jet. Magnus employed a rotating mirror, and also a rotating disk from which a fine slit was cut out. The readiest method of obtaining instantaneous illumination is the electric spark, but with this Magnus was not successful. The electric spark had, however, been used successfully for this purpose some years before by H. Buff (Liebig's Ann. lixviii. 1851), who observed the shadow of the jet on a white screen. Preferable to an opaque screen is a piece of ground glass, which allows the shadow to be examined from the farther side (Lorentz, Rayleigh). Further, the jet may be illuminated indirectly, if the illumination is properly managed. For this purpose it is necessary to place it between the source of light and the eye. The best effect is obtained when the light of the spark is somewhat diffused by being passed (for example) through a piece of ground glass.

The spark may be obtained from the secondary of an induction coil, whose terminals are in connexion with the coatings of a Leyden jar. By adjustment of the contact breaker the series of sparks may be made to fit more or less perfectly with the formation of the drops. A still greater improvement may be effected by using an electrically maintained fork, which performs the double office of controlling the resolution of the jet and of interrupting the primary current of the induction coil. In this form the experiment is one of remarkable beauty. The jet, illuminated only in one phase of transformation, appears almost perfectly steady, and may be examined at leisure. In one experiment the jet issued horizontally from an orifice of about half a centimetre in diameter, and almost immediately assumed a rippled outline. The gradually increasing amplitude of the disturbance, the formation of the elongated ligament, and the subsequent transformation of the ligament into a spherule, could be examined with ease. In consequence of the transformation being in a more advanced stage at the forward than at the hinder end, the ligament remains for a moment connected with the mass behind, when it has freed itself from the mass in front, and thus the resulting spherule acquires a backwards relative velocity, which of necessity leads to a collision. Under ordinary circumstances the spherule rebounds, and may be thus reflected backwards and forwards several times between the adjacent masses. Magnus showed that the stream of spherules may be diverted into another path by the attraction of a powerful electric rod, held a little below the place of resolution.

Very interesting modifications of these phenomena are observed when a jet from an orifice in a thin plate (Tyndall has shown that a pinhole gas burner may also be used with advantage) is directed obliquely upwards. In this case drops which break away with different velocities are carried under the action of gravity into different paths; and thus under ordinary circumstances a jet is apparently resolved into a "sheaf," or bundle of jets all lying in one vertical plane. Under the action of a vibrator of suitable periodic time the resolution is regularized, and then each drop, breaking away under like conditions, is projected with the same velocity, and therefore follows the same path. The apparent gathering together of the sheaf into a fine and well-defined stream is an effect of singular beauty.

In certain cases where the tremor to which the jet is subjected is compound, the single path is replaced by two, three or even more paths, which the drops follow in a regular cycle. The explanation has been given with remarkable insight by Plateau. If, for example, besides the principal disturbance, which determines the size of the drops, there be another of twice the period, it is clear that the alternate drop from the jet breaks away in different conditions and therefore with different velocities. Complete periodicity is only attained after the passage of a pair of drops; and thus the odd series of drops pursues one path, and the even series another.

Electricity, as has long been known, has an extraordinary influence upon the appearance of a fine jet of water ascending in a nearly perpendicular direction. In its normal state the jet resolves itself into drops, which even before passing the summit, and still more after passing it, are scattered through a considerable width. When a feeble electrified body (such as a stick of sealing-wax gently rubbed upon the coat sleeve) is brought into its neighbourhood, the jet undergoes a remarkable transformation and appears to become coherent; but under more powerful electrical action the scattering becomes even greater than at first. The second effect is readily attributed to the mutual repulsion of the electrified drops, but the action of feeble electricity in producing apparent coherence was long unexplained.

It was shown by W. von Bezect that the coherence is apparent only, and that the alternate drop from the jet breaks away is not perceptibly shifted by the electricity. By screening the various parts with metallic plates in connexion with earth, Bezect further proved that, contrary to the opinion of earlier observers, the seat of sensitiveness is not at the root of the jet where it leaves the orifice, but at the place of resolution into drops. An easy way of testing this conclusion is to excite the extreme tip of a glass rod, which is then held in succession to the root of the jet, and to the place of resolution. An effect is observed in the latter, and not in the former position.

The normal scattering of a nearly vertical jet is due to the rebound of the drops when they come into collision with one another. Such collisions are inevitable in consequence of the different velocities acquired by the drops under the action of the capillary force, as they break away irregularly from the continuous portion of the jet. Even when the resolution is regularized by the action of external vibrations of suitable frequency, as in the beautiful experiments of Savart and Plateau, the drops must still come into contact before they reach the summit of their parabolic path. In the case of a continuous jet, the equation of continuity shows that as the jet loses its velocity in ascending, it must increase in section. When the stream consists of drops following one another in single file, no such increase of section is possible; and then the constancy of the total stream requires a gradual approximation of the drops, which in the case of a nearly vertical direction of motion cannot stop short of actual contact. Regular vibration has, however, the effect of postponing the collisions and consequent scattering of the drops, and in the case of a direction of motion less nearly vertical, may prevent them altogether.

Under moderate electrical influence there is no material
CAPILLARY ACTION

change in the resolution into drops, nor in the subsequent motion of the drops up to the moment of collision. The difference begins here. Instead of rebounding after collision, as the unelectricised drops of clean water generally, or always, do, the electrified drops coalesce, and then the jet is no longer scattered about. When the electrical influence is more powerful, the repulsion between the drops is sufficient to prevent actual contact, and then, of course, there is no opportunity for amalgamation.

These experiments may be repeated with extreme ease, and with hardly any apparatus. The diameter of the jet may be about \( \frac{1}{2} \) in, and it may issue from a glass nozzle. The pressure may be such as to give a fountain about 2 ft. high. The change in the sound due to the falling drops as they strike the bottom of the sink should be noticed, as well as that in the appearance of the jet.

The actual behaviour of the colliding drops becomes apparent under instantaneous illumination, e.g. by sparks from a Leyden jar. The jet should be situated between the sparks and the eye, and the observation is facilitated by a piece of ground glass held a little behind the jet, so as to diffuse the light; or the shadow of the jet may be received on the ground glass, which is then held as close as possible on the side towards the observer.

In another form of the experiment, which, though perhaps less striking to the eye, lends itself better to investigation, the collision takes place between two still unresolved jets issuing horizontally from glass nozzles in communication with reservoirs containing water. One at least of the reservoirs must be insulated. In the absence of dust and greasy contamination, the obliquely colliding jets may rebound from one another without coalescence for a considerable time. In this condition there is complete electrical insulation between the jets, as may be proved by the inclusion in the circuit of a delicate galvanometer, and a low electro-motive force. But if the difference of potential exceed a small amount (1 or 2 volts), the jets instantaneously coalesce. There is no reason to doubt that in the case of the fountain also, coalescence is due to differences of potential between colliding drops.

If the water be soapy, and especially if it contain a small proportion of milk, coalescence ensues without the help of electricity. In the case of the fountain the experimenter may be made by leading tap-water through a Woulfe's bottle in which a little milk has been placed. As the milk is cleared out, the scattering of the drops is gradually re-established.

In attempting to explain these curious phenomena, it is well to consider what occurs during a collision. As the liquid masses approach one another, the intervening air has to be squeezed out. In the earlier stages of approximation the obstacle arising may not be important; but when the thickness of the layer of air is reduced to the point at which the colours of thin plates are visible, the approximation must be sensibly resisted by the viscosity of the air which still remains to be got rid of. No change in the capillary conditions can arrest the collision; the liquid is reduced to a small fraction of a wave-length of light; but such a reduction, unless extremely local, is strongly opposed by the remaining air. It is true that this opposition is temporary. The question is whether the air can everywhere be squeezed out during the short time over which the collision extends.

It would seem that the forces of electrical attraction act with peculiar advantage. If we suppose that upon the whole the air cannot be removed, so that the mean distance between the opposed surfaces remains constant, the electric attractions tend to produce an instability whereby the smaller intervals are diminished while the larger are increased. Extremely local contacts of the liquids, while opposed by capillary tension which tends to keep the surfaces flat, are thus favoured by the electrical forces, which moreover at the small distances in question act with exaggerated power.

A question arises as to the mode of action of milk or soap turbidity. The observation that it is possible for soap to be in excess may here have significance. It would seem that the surfaces, coming into collision within a fraction of a second of their birth, would still be subject to further contamination from the interior. A particle of soap rising accidentally to the surface would spread itself with rapidity. Now such an inward movement of the liquid is just what is required to hasten the removal of intervening air. It is obvious that the effect would fail if the contamination of the surface had proceeded too far previously to the collision.

This view is confirmed by experiments in which other gases are substituted for air as the environment of colliding jets. Oxygen and coal-gas were found to be without effect. On the other hand, the more soluble gases, carbon dioxide, nitrous oxide, sulphur dioxide, and steam, at once caused union.

**Stability of the Catenoid.**—When the internal pressure is equal to the external, the film forms a surface of which the mean curvature at every point is zero. The only surface of revolution having this property is the catenoid formed by the revolution of a cattenary about its directrix. This catenoid, however, is in stable equilibrium only when the portion considered is such that the tangents to the cattenary at its extremities intersect before they reach the directrix.

To prove this, let us consider the cattenary as the form of equilibrium of a chain suspended between two fixed points A and B. Suppose the chain hanging between A and B to be of very great length, then the tension at A or B will be very great. Let the chain be hauled in over a peg at A. At first the tension will diminish, but if the process be continued the tension will reach a minimum value and will afterwards increase to infinity as the chain between A and B approaches to the form of a straight line. Hence for every tension greater than the minimum tension there are two catenaries passing through A and B. Since the tension is measured by the height above the directrix these two catenaries have the same directrix. Every cattenary lying between them has its directrix higher, and every cattenary lying beyond them has its directrix lower than that of the two catenaries.

Now let us consider the surfaces of revolution formed by this system of catenaries revolving about the directrix of the two catenaries of equal tension. We know that the radius of curvature of a surface of revolution in the plane normal to the meridian plane is the portion of the normal intercepted by the axis of revolution.

The radius of curvature of a cattenary is equal and opposite to the portion of the normal intercepted by the directrix of the cattenary. Hence a catenoid whose directrix coincides with the axis of revolution has at every point its principal radii of curvature equal and opposite, so that the mean curvature of the surface is zero.

The catenaries which lie between the two whose direction coincides with the axis of revolution generate surfaces whose radius of curvature convex towards the axis in the meridian plane is less than the radius of concave curvature. The mean curvature of these surfaces is therefore convex towards the axis. The catenaries which lie beyond the two generate surfaces whose radius of curvature convex towards the axis in the meridian plane is greater than the radius of concave curvature. The mean curvature of these surfaces is, therefore, concave towards the axis.

Now if the pressure is equal on both sides of a liquid film, and if its mean curvature is zero, it will be in equilibrium. This is the case with the two catenaries. If the mean curvature is convex towards the axis the film will move from the axis. Hence if a film in the form of the cattenoid which is nearest the axis is ever so slightly displaced from the axis it will move farther from the axis till it reaches the other catenoid.

If the mean curvature is concave towards the axis the film will tend to approach the axis. Hence if a film in the form of the cattenoid which is nearest the axis be displaced towards the axis, it will tend to move farther towards the axis and will collapse. Hence the film in the form of the cattenoid which is nearest the axis is in unstable equilibrium under the condition that it is exposed to equal pressures within and without. If, however, the circular ends of the cattenoid are closed with solid disks, so that the volume of air contained between these disks and the film is determinate, the film will be in stable equilibrium however large a portion of the cattenary it may consist of.
CAPILLARY ACTION

273

The criterion as to whether any given catenoid is stable or not may be obtained as follows:

Let PABQ and ApB (fig. 14) be two catenaries having the same directrix and intersecting in A and B. Draw Pp and Qq touching both catenaries, Pp and Qq will intersect at T, a point in the directrix; for since any catenary with its directrix is a similar figure to any other catenary with its directrix, if the directrix of the one coincides with that of the other the centre of similitude must lie on the common directrix. Also, since the curves at P and p are equally inclined to the directrix, P and p are corresponding points and the line Pp must pass through the centre of similitude. Similarly Qq must pass through the centre of similitude. Hence T, the point of intersection of Pp and Qq, must be the centre of similitude and must be on the common directrix. Hence the tangents at A and B to the upper catenary must intersect above the directrix, and the tangents at A and B to the lower catenary must intersect below the directrix. The condition of stability of a catenoid is therefore that the tangents at the extremities of its generating catenary must intersect before they reach the directrix.

Stability of a Plane Surface.—We shall next consider the limiting conditions of stability of the horizontal surface which separates a heavier fluid above from a lighter fluid below. Thus, in an experiment of F. Duprez ("Sur un cas particulier de l'équilibre des liquides," Nouv. Mém. de l'Acad. de Belgique, 1851 et 1852), a vessel containing olive oil was placed with its mouth downwards in a vessel containing a mixture of alcohol and water, the mixture being denser than the oil. The surface of separation is in this case horizontal and stable, so that the equilibriums is established of itself. Alcohol is then added very gradually to the mixture till it becomes lighter than the oil. The equilibriums of the fluids would now be unstable if it were not for the tension of the surface which separates them, and which, when the orifice of the vessel is not too large, continues to preserve the stability of the equilibriums.

When the equilibriums at last becomes unstable, the destruction of equilibriums takes place by the lighter fluid ascending in one part of the orifice and the heavier descending in the other. Hence the displacement of the surface to which we wish to direct our attention is one which does not alter the volume of the liquid in the vessel, and which therefore is upward in one part of the surface and downward in another. The simplest case is that of a rectangular orifice in a horizontal plane, the sides being a and b.

Let the surface of separation be originally in the plane of the orifice, and let the co-ordinates x and y be measured from one corner parallel to the sides a and b respectively, and let z be measured upwards. Then if \( \rho \) be the density of the upper liquid, and \( \sigma \) that of the lower liquid, and P the original pressure at the surface of separation, then when the surface receives an upward displacement z, the pressure above it will be \( P - \rho \sigma g z \), and that below it will be \( P + \rho \sigma g z \), so that the surface will be acted on by an upward pressure \( (\rho - \sigma)g z \). Now if the displacement z be everywhere very small, the curvature in the planes parallel to xz and yz will be \( \frac{d^2z}{dx^2} \) and \( \frac{d^2z}{dy^2} \) respectively, and if T is the surface-tension the whole upward force will be

\[
T \left( \frac{d^2z}{dx^2} + \frac{d^2z}{dy^2} \right) + (\rho - \sigma)g \frac{dz}{dx}.
\]

If this quantity is of the same sign as \( z \), the displacement will be increased, and the equilibriums will be unstable. If it is of the opposite sign from \( z \), the equilibriums will be stable. The limiting condition may be found by putting it equal to zero. One form of the solution of the equation, and that which is applicable to the case of a rectangular orifice, is

\[
z = C \sin px \sin qy.
\]

Substituting in the equation we find the condition

\[
(p + q) - (\rho - \sigma)g = 0 \quad \text{neutral,}
\]

\[
(p - q) - (\rho - \sigma)g = 0 \quad \text{stable}
\]

That the surface may coincide with the edge of the orifice, which is a rectangle, whose sides are a and b, we must have

\[
\rho_0 = \mu_x \sigma, \quad \rho_b = \mu_y \sigma,
\]

when \( m \) and \( n \) are integral numbers. Also, if \( m \) and \( n \) are both unity, the displacement will be entirely positive, and the volume of the liquid will not be constant. That the volume may be constant, either \( n \) or \( m \) must be an even number. We have, therefore, to consider the conditions under which

\[
\left( \frac{m^2}{a^2} + \frac{n^2}{b^2} \right) T - (\rho - \sigma)g
\]

cannot be made negative. Under these conditions the equilibriums is stable for all small displacements of the surface. The smallest admissible value of \( \frac{m^2}{a^2} + \frac{n^2}{b^2} \) is \( \frac{a^2}{c} + \frac{b^2}{c} \) where \( a \) is the longer side of the rectangle. Hence the condition of stability is that

\[
\left( \frac{1}{a^2} + \frac{1}{b^2} \right) T - (\rho - \sigma)g
\]

is a positive quantity. When the breadth \( b \) is less than \( \sqrt{\frac{T}{\rho - \sigma}} \) the length \( a \) may be unlimited.

When the orifice is circular of radius \( a \), the limiting value of \( \frac{T}{a^2} \) is \( \sqrt{\frac{\pi^2}{3(\rho - \sigma)}} \), where \( \pi \) is the least root of the equation

\[
\left( 2 \sin^2 + 2 \sin^4 + \frac{\rho^2}{2\pi^2} \right) + \frac{\rho^2}{4(\pi^2)R + \ldots} = 0.
\]

The least root of this equation is

\[
\pi = \frac{3}{3(\pi^2)}
\]

If \( k \) is the height to which the liquid will rise in a capillary tube of unit radius, then the diameter of the largest orifice is

\[
2a = \frac{3}{3(\pi^2)} \sqrt{(2k)} = \frac{5}{4} \sqrt{\frac{k}{33}}
\]

Duprez found from his experiments

\[
2a = \frac{5}{4} \sqrt{\frac{k}{33}}
\]

[The above theory may be well illustrated by a lecture experiment. A thin-walled glass tube of internal diameter equal to 14 mm. is ground true at the lower end. The upper end is contracted and is fitted with a rubber tube under the control of a pinch-cock. Water is sucked up from a vessel of moderate size, the rubber is nipped, and by a quick motion the tube and vessel are separated, preferably by a downward movement of the latter. The inverted tube, with its suspended water, being held in a clamp, a beaker containing a few drops of ether is brought up from below until the free surface of the water is in contact with ether vapour. The lowering of tension, which follows the condensation of the vapour, is then strikingly shown by the sudden precipitation of the water.]

Effect of Surface-tension on the Velocity of Waves.—When a series of waves is propagated on the surface of a liquid, the surface-tension has the effect of increasing the pressure at the crests of the waves and diminishing it in the troughs. If the wave-length is \( \lambda \), the equation of the surface is

\[
y = b \sin \frac{2\pi x}{\lambda}
\]

The pressure due to the surface tension \( T \) is

\[
p = \frac{T}{\lambda^2} \frac{d^2y}{dx^2} = \frac{4\pi^2}{\lambda^2} T y.
\]

This pressure must be added to the pressure due to gravity \( g \). Hence the waves will be propagated as if the intensity of gravity had been

\[
y = \frac{g + \frac{4\pi^2}{\lambda^2} T y}{\rho}
\]

instead of \( g \). Now it is shown in hydrodynamics that the velocity of propagation of waves in deep water is that acquired by a heavy body falling through half the radius of the circle whose circumference is the wave-length, or

\[
v = \frac{\sqrt{\rho}}{2\pi} \sqrt{\frac{T}{\rho}}
\]

This velocity is a minimum when

\[
\lambda = 2\pi \sqrt{\frac{T}{\rho}}
\]

and the minimum value is

\[
v = \frac{\sqrt{\rho}}{2\pi} \sqrt{\frac{T}{\rho}}
\]

For waves whose length from crest to crest is greater than \( \lambda \), the principal force concerned in the motion is that of gravitation.
CAPILLARY ACTION

For waves whose length is less than \( \lambda \) the principal force concerned is that of surface-tension. Lord Kelvin proposed to distinguish the latter kind of waves by the name of ripples.

When a small body is partly immersed in a liquid originally at rest, and moves horizontally with constant velocity \( V \), waves are propagated through the liquid with various velocities according to their respective wave-lengths. In front of the body the relative velocity of the fluid and the body varies from \( V \) where the fluid is at rest, to zero at the cutwater on the front surface of the body. The waves produced by the body will travel forwards faster than the body till they reach a distance from it at which the relative velocity of the body and the fluid is equal to the velocity of propagation corresponding to the wave-length. The waves then travel along with the body at a constant distance in front of it. Hence at a certain distance in front of the body there is a series of waves which are stationary with respect to the body. Of these, the waves of minimum velocity form a stationary wave nearest to the front of the body. Between the body and this first wave the surface is comparatively smooth. Then comes the stationary wave of minimum velocity, which is the most marked of the series. In front of this is a double series of stationary waves, the gravitation waves forming a series increasing in wave-length with their distance in front of the body, and the surface-tension waves or ripples diminishing in wave-length with their distance from the body, and both sets of waves rapidly diminishing in amplitude with their distance from the body.

If the current-function of the water referred to the body considered as origin is \( \psi \), then the equation of the form of the crest of a wave of velocity \( w \), the crest of which travels along with the body, is

\[
d\psi = w
ds
\]

where \( ds \) is an element of the length of the crest. To integrate this equation for a solid of given form is probably difficult, but it is easy to see that at some distance on either side of the body, where the liquid is sensibly at rest, the crest of the wave will approximate to an asymptote inclined to the path of the body at an angle whose sine is \( w/V \), where \( w \) is the velocity of the wave and \( V \) is that of the body.

The crests of the different kinds of waves will therefore appear to diverge as they get farther from the body, and the waves themselves will be less and less perceptible. But those whose wave-length is near to that of the wave of minimum velocity will diverge less than any of the others, so that the most marked feature at a distance from the body will be the two long lines of ripples of minimum velocity. If the angle between these is \( \theta \), the velocity of the body is \( \sec \theta \), where \( w \) for water is about 23 centimetres per second.

Lord Kelvin's formula (1) may be applied to find the surface-tension of a clean or contaminated liquid from observations upon the length of waves of known periodic time, travelling over the surface. If \( \tau = \lambda/\pi \) we have

\[
T = \frac{\rho h^3}{2\pi^2} \cos \frac{2\pi h^2}{\lambda} \times \frac{\lambda^3}{4\pi^3}. \quad (2)
\]

\( h \) denoting the depth of the liquid. In observations upon ripples the factor involving \( h \) may usually be omitted, and thus in the case of water (\( \rho = 1 \))

\[
T = \frac{\lambda^3}{2\pi^2} \times \frac{\rho}{4\pi^3}. \quad (3)
\]

simply. The method has the advantage of independence of what may occur at places where the liquid is in contact with solid bodies.

The waves may be generated by electrically maintained tuning-forks from which dippers touch the surface; but special arrangements are needed for rendering them visible. The obstacles are (1) the smallness of the waves, and (2) the changes which occur at speeds too rapid for the eye to follow. The second obstacle is surmounted by the aid of the stroboscopic method of observation, the light being intermittent in the period of vibration, so that practically only one phase is seen. In order to render visible the small waves employed, and which we may regard as deviations of a plane surface from its true figure, the method by which Foucault tested reflectors is suitable. The following results have been obtained

- Clean ........................................ 74-0
- Creasy to the point where compared markedly decreased .... 53-0
- Saturated with olive oil ...................... 41-0
- Saturated with sodium oleate ............... 25-0

(Phil. Mag. November 1890) for the tensions of various water-surfaces at 18° C., reckoned in C. G. S. measure.

The tension for clean water thus found is considerably lower than that (81) adopted by Quincke, but it seems to be entitled to confidence, and at any rate the deficiency is not due to contamination of the surface.

A calculation analogous to that of Lord Kelvin may be applied to find the frequency of small transverse vibrations of a cylinder of liquid under the action of the capillary force. Taking the case where the motion is strictly in two dimensions, we may write as the polar equation of the surface at time \( t \)

\[
r = a + \alpha \cos \theta \cos \phi t, \quad \quad (4)
\]

where \( p \) is given by

\[
p = (n^2 - n) \frac{T}{\rho \alpha^2}. \quad \quad (5)
\]

If \( n = 1 \), the section remains circular, there is no force of restitution, and \( p = 0 \). The principal vibration, in which the section becomes elliptical, corresponds to \( p = 1 \).

Vibrations of this kind are observed whenever liquid issues from an elliptical or other non-circular hole, or even when it is poured from the lip of an ordinary jug; and they are superposed upon the general progressive motion. Since the phase of vibration depends upon the time elapsed, it is always the same as the same point in space, and thus the motion is steady in the hydrodynamical sense, and the boundary of the jet is a fixed surface. In so far as the vibrations may be regarded as isochronous, the distance between consecutive corresponding points of the recurrent figure, or, as it may be called, the wave-length of the figure, is directly proportional to the velocity of the jet, i.e. to the square root of the head. But as the head increases, so do the lateral velocities which go to form the transverse vibrations. A departure from the law of isochronism may then be expected to develop itself.

The transverse vibrations of non-circular jets allow us to solve a problem which at first sight would appear to be of great difficulty. According to Marangoni the diminished surface-tension of soapy water is due to the formation of a film. The formation cannot be instantaneous, and if we could measure the tension of a surface not more than \( \frac{1}{30} \) of a second old, we might expect to find it undisturbed, or nearly so, from that proper to pure water. In order to carry out the experiment the jet is caused to issue from an elliptical orifice in a thin plate, about 2 mm. by 1 mm., under a head of 15 cm. A comparison under similar circumstances shows that there is hardly any difference in the wave-lengths of the patterns obtained with pure and with soapy water, from which we conclude that at this initial stage, the surface-tensions are the same. As early as 1869 Dupré had arrived at a similar conclusion from experiments upon the vertical rise of fine jets.

A formula, similar to (5), may be given for the frequencies of vibration of a spherical mass of liquid under capillary force. If, as before, the frequency be \( p/\pi \), and \( a \) the radius of the sphere, we have

\[
p = n(n-1)(n+2) \frac{T}{\rho a^3}. \quad \quad (6)
\]

\( n \) denoting the order of the spherical harmonic by which the deviation from a spherical figure is expressed. To find the radius of the sphere of water which vibrates seconds, put \( p = \pi, T = 81, \rho = 1, n = 2 \). Thus \( a = 2.54 \) cms., or one inch very nearly.

**TABLE OF SURFACE-TENSION**

In the following tables the units of length, mass and time are the centimetre, the gramme and the second, and the unit of force is that which if it acted on one grammie for one second would communicate to it a velocity of one centimetre per second:
Table of Surface-Tension at 20° C. (Quincke).

Olive Oil and Alcohol, 12-2.
Olive oil and aqueous solution (sp. g. -9.231, tension of free surface 25-5), 6-8, angle 87° 48'.

Quincke has determined the surface-tension of a great many substances near their point of fusion or solidification. His method was that of observing the form of a large drop standing on a plane surface. If K is the height of the flat surface of the drop, and k that of the point where its tangent plane is vertical, then

\[ T = \frac{1}{2}(K-k)^2g. \]

Quincke finds that for several series of substances the surface-tension is nearly proportional to the density, so that if we call

Surface-Tensions of Liquids at their Point of Solidification.

\((K-k)^2 = \frac{2T}{g}\) the specific cohesion, we may state the general results of his experiments as follows:

The bromides and iodides have a specific cohesion about half that of mercury. The nitrites, chlorides, sugars and fats, as also the metals lead, bismuth and antimony, have a specific cohesion nearly equal to that of mercury. Water, the carbonates and sulphates, and probably phosphates, and the metals platinum, gold, silver, cadmium, tin and copper have a specific cohesion double that of mercury. Zinc, iron and palladium, three times that of mercury, and sodium, six times that of mercury.

Relation of Surface-tension to Temperature

It appears from the experiments of Brunner and of Wolf on the ascent of water in tubes that at the temperature 9° centigrade

\[ T = \frac{75-20}{1 - 0.001872} \] (Brunner);
\[ = \frac{76-08}{1 - 0.00212 - 0.000000152} \] for a tube -0.2346 cm. diameter (Wolf);
\[ = \frac{77-34}{1 - 0.001816} \] for a tube -0.098 cm. diameter (Wolf).

Lord Kelvin has applied the principles of Thymodynamics to determine the thermal effects of increasing or diminishing the area of the free surface of a liquid, and has shown that in order to keep the temperature constant while the area of the surface increases by unity, an amount of heat must be supplied
to the liquid which is dynamically equivalent to the product of the absolute temperature into the decrement of the surface-tension per degree of temperature. We may call this the latent heat of surface-extension.

It appears from the experiments of C. Brunner and C. J. E. Wolf that at ordinary temperatures the latent heat of extension of the surface of water is dynamically equivalent to about half the mechanical work done in producing the surface-extension.

References—Further information on some of the matters discussed above will be found in Lord Rayleigh's *Collectd Scientific Papers* (1901). In its full extension the subject of capillarity is very wide. Reference may be made to A. W. Reinold and Sir A. W. Rücker (*Phil. Trans. 1886*, p. 627); Sir W. Ramsay and J. Shields (*Zeitschr. physik. Chem. 1891*, 12, p. 433); and on the theoretical side, see papers by Joseph Willard Gibbs; R. Eötvöss (*Wied. Ann.*, 1886, 27, p. 452); J. D. Van der Waals, G. Bakker and other writers of the Dutch school.

CAPISTRANO, GIOVANNI DI (1386-1436), Italian friar, theologian and inquisitor, was born in the little village of Capistrano in the Abruzzi, of a family which had come to Italy with the Angevins. He lived at first a wholly secular life, married, and became a successful magistrate; he took part in the continual struggles of the small Italian states in such a way as to compromise himself. During his captivity he was practically ruined and lost his young wife. He then in despair entered the Franciscan order and at once gave himself up to the most rigorous asceticism, violently defending the ideal of a strict observance. He was charged with various missions by the popes Eugenius IV, and Nicholas V, in which he acquitted himself with impalpable violence. As legate or inquisitor he persecuted the last Fraticelli of Ferrara, the Jesuati of Venice, the Jews of Sicily, Moldavia and Poland, and, above all, the Hussites of Germany, Hungary and Bohemia; his aim in the last case was to make conferences impossible between the representatives of Rome and the Bohemians, for every attempt at conciliation seemed to him to be compromising at heresy. Finally, after the taking of Constantinople, he succeeded in gathering troops together for a crusade against the Turks (1455), which at least helped to raise the siege of Belgrade, which was being blockaded by Mohammed II. He died shortly afterwards (October 23, 1456), and was canonized in 1690. Capistrano, in spite of this restless life, found time to work both in the lifetime of his master St. Bernardino of Siena and after, at the reform of the order of the minor Franciscans, and to hold both in his writings and his speeches the most advanced theories upon the papal supremacy as opposed to that of the councils.

See E. Jacob, "Das Leben und Wirken Capistrans," vol. i.; "Die landschreiflichen Aufzeichnungen von Reden und Traktaten Capistrans," (1st series, Breslau, 1903-1908.)

CAPITAL (Lat. capit, head), in architecture, the crowning member of the column, which projects on each side as it rises, in order to support the abacus and unite the square form of the latter with the circular shaft. The bulk of the capital may either be convex, as in the Doric capital; concave, as in the bell of the Corinthian capital; or bracketed out, as in the Ionic capital. These are the three principal types on which all capitals are based. The capitals of Greek, Doric, Ionic and Corinthian orders are given in the article ORDER.

From the prominent position it occupies in all monumental buildings, it has always been the favourite feature selected for ornamentation, and consequently it has become the clearest indicator of any style.

The two earliest capitals of importance are those which are based on the lotus (fig. 1) and papyrus (fig. 2) plants respectively, and these, with the palm tree capital, were the chief types employed by the Egyptians down to the 3rd century B.C., when,
under the Ptolemaic dynasties, various river plants were employed decoratively and the lotus capital goes through various modifications (fig. 3). Some kind of volute capital is shown in the Assyrian bas-reliefs, but no Assyrian capital has ever been found; those exhibited as such in the British Museum are bases. The Persian capital belongs to the third class above mentioned, the brackets are carved with the lion (fig. 4) or the griffin projecting right and left to support and lessen the bearing of the architrave, and on their backs carry other brackets at right angles to support the cross timbers. The profuse decoration underneath the bracket capital in the palace of Xerxes and elsewhere, serves no structural function, but gives some variety to the extenuated shaft.

The earliest Greek capital is that shown in the Temple-fresco at Cnossus in Crete (1600 B.C.); it was of the first type—convex, and was probably moulded in stucco: the second is represented by the richly carved example of the columns (fig. 5) flanking the tomb of Agamemnon in Mycenae (c. 1100 B.C.), also convex, carved with the chevron device, and with an apophyge on which the buds of some flowers are sculptured. The Doric capital of the temple of Apollo at Syracuse (c. 700 B.C.) follows, in which the echinus moulding has become a more definite form: this in the Parthenon reaches its culmination, where the convexity is at the top and bottom with a delicate unifying curve. The sloping side of the echinus becomes flatter in the later examples, and in the Colosseum at Rome forms a quarter round.

In the Ionic capital of the Archaic temple of Diana at Ephesus (560 B.C.) the width of the abacus is twice that of its depth, consequently the earliest Ionic capital known was virtually a bracket capital. A century later, in the temple on the Ilius, published in Stuart and Revett, the abacus has become square. One of the most beautiful Corinthian capitals is that from the Tholos of Epidaurus (400 B.C.) (fig. 6); it illustrates the transition between the earlier Greek capital of Bassae and the Roman version of the temple of Mars Ultor (fig. 7).

The foliage of the Greek Corinthian capital was based on the Acanthus spinosus, that of the Roman on the Acanthus mollis; the capital of the temple of Vesta and other examples at Pompeii are carved with foliage of a different type.

Byzantine capitals are of endless variety; the Roman composite capital would seem to have been the favourite type they followed at first: subsequently, the block of stone was left rough as it came from the quarry, and the sculptor, set to carve it, evolved
new types of design to his own fancy, so that one rarely

![Fig. 8.—Byzantine Capitals from the central portal of St Mark's, Venice.](image)

meets with many repetitions of the same design. One of the most remarkable is the capital in which the leaves are carved as if blown by the wind; the finest example being in Sta Sophia, Thessalonica; those in St Mark's, Venice (fig. 8) specially attracted Ruskin's fancy. Others are found in St Apollinare-in-classe, Ravenna. The Thistle and Pine capital is found in St Mark's, Venice; St Luke's, Delphi; the mosques of Kairawan and of Ibn Tulün, Cairo, in the two latter cases

![Fig. 9.—Byzantine Capital from the Church of S. Vitale, Ravenna.](image)

![Fig. 10.—Byzantine Capital from the Church of S. Vitale, Ravenna.](image)

being taken from Byzantine churches. The illustration of the capital in S. Vitale, Ravenna (figs. 9 and 10) shows above it the dossaret required to carry the arch, the springing of which was much wider than the abacus of the capital.

The Romanesque and Gothic capitals throughout Europe present the same variety as in the Byzantine and for the same reason, that the artist evolved his conception of the design from the block he was carving, but in these styles it goes further on account of the clustering of columns and piers.

The earliest type of capital in Lombardy and Germany is that which is known as the cushion-cap, in which the lower portion of the cube block has been cut away to meet the circular shaft (fig. 11). These early types were generally painted at first with various geometrical designs, afterwards carved.

In Byzantine capitals, the eagle, the lion and the lamb are occasionally carved, but treated conventionally.

In the Romanesque and Gothic styles, in addition to birds and beasts, figures are frequently introduced into capitals, those in the Lombard work being rudely carved and verging on the grotesque; later, the sculpture reaches a higher standard; in the cloisters of Monreale (fig. 12) the birds being wonderfully true to nature. In England and France (figs. 13 and 14), the figures introduced into the capitals are sometimes full of character. These capitals, however, are not equal to those of the Early English school, in which the foliage is conventionally treated as if it had been copied from metal work, and is of infinite variety, being found in small village churches as well as in cathedrals.

Reference has only been made to the leading examples of the Roman capitals; in the Renaissance period (fig. 15) the feature became of the greatest importance and its variety almost as great as in the Byzantine and Gothic styles. The pilaster, which
was employed so extensively in the Revival, called for new combinations in the designs for its capitals. Most of the ornament can be traced to Roman sources, and although less vigorous, shows much more delicacy and refinement in its carving.

(R. P. S.)

**CAPITAL** (i.e. capital stock or fund), in economics, generally, the accumulated wealth either of a man or a community, that is available for earning interest and producing fresh wealth. In social discussion it is sometimes treated as antithetical to labour, but it is in reality the accumulated savings of labour and of the profits accruing from the savings of labour. It is that portion of the annual produce reserved from consumption to supply future wants, to extend the sphere of production, to improve industrial instruments and processes, to carry out works of public utility, and, in short, to secure and enlarge the various means of progress necessary to an increasing community. It is the increment of wealth or means of subsistence analogous to the increment of population and of the wants of civilized man. Hence J. S. Mill and other economists, when seeking a graphic expression of the service of capital, have called it "abstinence." The labourer serves by giving physical and mental effort in order to supply his means of consumption. The capitalist, or labourer-capitalist, serves by abstaining from consumption, by denying himself the present enjoyment of more or less of his means of consumption, in the prospect of a future profit. This quality, apparent enough in the beginnings of capital, applies equally to all its forms and stages; because whether a capitalist stocks his warehouse with goods and produce, improves land, lends on mortgage or other security, builds a factory, opens a mine, or orders the construction of machines or ships, there is the element of self-deprival for the present, with the risk of ultimate loss of what is his own, and what, instead of saving and embodying in some productive form, he might choose to consume. On this ground rests the justification of the claims of capital to interest. It is to be returned, either in the form of rent, interest or profits of trade and investment.

To any advance in the arts of industry or the comforts of life, a rate of production exceeding the rate of consumption, with consequent accumulation of resources, or in other words, the formation of capital, is indispensable. The primitive cultivators of the soil, whether those of ancient times or the pioneers who formed settlements in the forests of the New World, soon discovered that their labour would be rendered more effective by implements and auxiliary powers of various kinds, and that until the produce from existing means of cultivation exceeded what was necessary for their subsistence, there could be neither labour on their part to produce such implements and auxiliaries, nor means to purchase them. Every branch of industry has thus had a demand for capital within its own circles from the earliest times. The flint arrow-heads, the stone and bronze utensils of fossileiferous origin, and the rude implements of agriculture, war and navigation, of which we read in Homer, were the forerunners of that rich and wonderful display of tools, machines, engines, furnaces and countless ingenious and costly appliances, which represent so large a portion of the capital of civilized countries, and without the pre-existing capital could not have been developed. Nor in the cultivation of land, or the production simply of food, is the need of implements, and of other auxiliary power, whether animal or mechanical, the only need immediately experienced. The demands on the surplus of produce over consumption are various and incessant. Near the space of reclaimed ground, from which the cultivator derives but a bare livelihood, are some marshy acres that, if drained and enclosed, would add considerably in two or three years to the produce; the forest and other natural obstructions might also be driven farther back with the result, in a few more years, of profit; fences are necessary to allow of pasture and field crops, roads have to be made and farms improved, and to be erected; as the work proceeds more artificial investments follow, and by these successive outlays of past savings in improvements, renewed and enhanced from generation to generation, the land, of little value in its natural state either to the owner and cultivator or the community, is at length brought into a highly productive condition. The history of capital in the soil is substantially the history of capital in all other spheres. Not every process can be made in any sphere, small or large, without reserved funds possessed by few or more persons, in small or large amounts, and the progress in all cases is adventured under self-deprival in the meanwhile of acquired value, and more or less risk as to the final result.

Capital is necessarily to be distinguished from money, with which in ordinary nomenclature it is almost identical. Wealth may be in other things than money; oxen, wives, tools, have at different stages of civilization represented the recognized form of capital; and modern usage only treats capital as meaning the command of money because money is the ordinary form of it nowadays. The capital of a country can scarcely be said to be less than the whole sum of its investments in a productive form, and possessing a recognized productive value.

Adam Smith's distinction of "fixed" and "circulating" capital in the Wealth of Nations (book ii. c. i.) cannot fail to be always useful in exhibiting the various forms and conditions under which capital is employed. Yet the principal phenomena of capital are found to be the same, whether the form of investment be more or less permanent or circula. The machinery in which capital is "fixed," and which yields a profit without apparently changing hands, is in reality passing away day by day, until it is worn out, and has to be replaced. So also of drainage and other land improvements. When the natural forests have been consumed and the landowners begin to plant trees on the bare places, the plantations while growing are a source of health, shelter and embellishment—they are not without a material profit throughout their various stages to maturity—and when, at the lapse of twenty or more years, they are ready to be cut down, and the timber is sold for useful purposes, there is a harvest of the original capital expended as essentially as in the case of the more rapid yearly crops of wheat or oats. The chief distinction would appear to rest in the A. Marschall of E. Baumol, between the outlet of capital and its return. Capital may be employed in short loans or bills of exchange at two or three months, in paying wages of labour for which there may be return in a day or not in less than a year or more, or in operations involving within themselves every form of capital expenditure, and requiring a few years or ninety-nine years for the promised fructification on which they proceed. But the common characteristic of capital is that of a fund yielding a return and reproducing itself whether the time to the end be long or short. The division of expenditure or labour (all expenditure having a destination to labour of one kind or another) into "productive" and "unproductive" by the same authority (book ii. c. 3) is also apposite both for purposes of political economy and practical guidance, though economists have found it difficult to define where "productive expenditure" ends and "unproductive expenditure" begins. Adam Smith includes in his enumeration of the "fixed capital" of a country the "appliances of life" and "all the implements" and in this sense expenditure on education, arts and sciences might be deemed expenditure of the most productive value, and yet be wanting in strict commercial account of the profit and loss. It must be admitted that there is a personal expenditure among all ranks of society, which, though not in any sense a capital expenditure, may become capital and receive a productive application, always to be preferred to the grossly unproductive form, in the interest both of the possessors and of the community.

The subject in its details is full of controversies, and a discussion of it at any length would embrace the whole field of economics. The result of this enumeration will be found to be confirmed with in every important economic work, but the following may be specially consulted:—J. S. Mill, Principles of Political Economy; J. E. Cairns, Some Leading Principles of Political Economy; F. A. Walker, Political Economy; J. B. Clark, Principles of Economics; E. Bohm v. Bawerk, Capital and Interest; K. Marx, Capital; J. B. Clark, Capital and its Earnings; see also the economic works of W. H. Mallock (Critical Examination of Socialism, 1906, &c.) for an insistence on the importance of "ability," or brain-work, as against much of modern socialist theorizing against "capitalism."
CAPITAL PUNISHMENT. By this term is now meant the infliction of the penalty of death for crime under the sentence of some properly constituted authority, as distinguished from killing the offender as a matter of self-defence or private vengeance, or under the order of some self-constituted or irregular tribunal unknown to the law, such as that of the Vigilantes of California, or of lynching law (q.v.). In the early stages of society a man-slayer was killed by the “avenger of blood” or on behalf of the family of the man killed, and not as representing the authority of the state (Pollock and Maitland, Hist. Eng. Law, ii. 447.) This mode of dealing with homicide survives in the vendetta of Corsica and of the Mainotes in Greece, and in certain of the southern states of North America. The obligation or inclination to take vengeance depends on the fact of homicide, and not on the circumstances in which it was committed, i.e. it is a part of the lex talionis. The mischief of this system was alleviated under the Levitical law by the creation of cities of refuge, and in Greece and Italy, both in Pagan and Christian times, by the recognition of the right of sanctuary in temples and churches. A second mode of dealing with homicide was that known to early Teutonic and early Celtic law, where the relatives of the deceased presented a bone of the dead man to the law, received the inheritance, the deceased, i.e. a payment in proportion to the rank of the slain, and the king received the blood-wite for the loss of his man. But even under this system certain crimes were in Anglo-Saxon law bot-less, i.e. no compensation could be paid, and the offender must suffer the penalty of death. In the laws of Kammurabi, king of Babylon (2285-2242 B.C.), the death penalty is imposed for many offences. The modes for executing it specially named are burning, drowning and impalement (Oldest Code of Laws, by C. H. W. Johns, 1903). Under the Roman law, “capital” punishment also included punishments which deprived the offender of the status of Roman citizen (capitis damnatio, capitis amissio), i.e. condemnation to servitude in the mines or to deportation to an island (Dig. 48. 19).

United Kingdom. The modes of capital punishment in England under the Saxon and Danish kings were various: hanging, beheading, burning; drowning, stoning, and impalement from rocks. The principle on which this variety depended was that where an offence was such as to entitle the king to outlaw the offender, he forfeited all, life and limb, lands and goods, and that the king might take his life and choose the mode of death. William the Conqueror would not allow judgment of death to be executed by hanging and substituted mutilation; but his successors varied somewhat in their policy as to capital punishment, and by the 13th century the penalty of death became by usage (without legislation) the usual punishment for high and petty treason and for all felonies (except mayhem and petty larceny, i.e. theft of property worth less than i s.; see Stephen, Hist. Cr. Law, vol. i. 458; Pollock and Maitland, Hist. Eng. Law, vol. ii. 459. It therefore included all the more serious forms of crime against person or property, such as murder, manslaughter, arson, highway robbery, burglary (or hamesucken) and larceny; and when statutory felonies were created they were also punishable by death unless the statute otherwise provided. The death penalty was also extended to heretics under the fit de heretico comburendo, which was lawfully issuable under statute from 1382 (5 Ric. II. stat. 3) until 1677 (20 Chas. II. c. 9). For this purpose the legislature had adopted the civil law of the Roman Empire, which was not a part of the English common law (Stephen, Hist. Cr. Law, vol. ii. 438-456). The methods of execution by crucifixion (as under the Roman law), or breaking on the wheel (as under the Roman Dutch law and the Holy Roman Empire), were never recognized by the common law, and would fall within the term “cruel and unusual punishments” in the English Bill of Rights, and in the United States would seem to be unconstitutional (see Wilkinson v. Utah, 1880, 136 U.S. 436, 440).

The severity of barbarian and feudal laws was mitigated, so far as common-law offences were concerned, by the influence of the Church as the inheritor of Christian traditions and Roman jurisprudence. The Roman law under the empire did not allow the execution of citizens except under the Lex Porcia. But the right of the emperors to legislate per rescriptum principis enabled them to disregard the ordinary law when so disposed. The 83rd novel of Justinian provided that criminal causes against clerics should be tried by the judges, and that the convicted cleric should be degraded by his bishop before his condemnation by the secular power, and other novels gave the bishops considerable influence, if not authority, over the lay judiciary. In western Europe the right given by imperial legislation in the Eastern Empire was utilized by the Papacy to claim privilege of clergy, i.e. that clerks must be remitted to the bishop for canonical punishment, and not subjected to civil condemnation at all.

The history of benefit of clergy is given in Pollock and Maitland, Hist. English Law, vol. i. pp. 424-440, and Stephen, Hist. Cr. Law, vol. iii. 450, 464. By degrees the privilege was extended not only to persons who could prove ordination or show a genuine tonsure, but all persons who had sufficient learning to be able to read the text of the law. Before the Reformation the ecclesiastical courts had ceased to take any effective action with regard to clerks convicted of offences against the king’s peace and by the time of Henry VII. burning on the hand under the order of the king’s judges was substituted for the old process of compurgation in use in the spiritual courts.

The effect of the claim of benefit of clergy is said to have been to increase the number of convictions, though it mitigated the punishment; and it became, in fact, a means of showing mercy to certain classes of individuals convicted of crime as a kind of privilege to the educated, i.e. to all clerks whether secular or religious (25 Edw. III. stat. 3); and it was allowed only in cases of a first conviction, except in the case of clerks who could produce their letters of orders or a certificate of ordination. To prevent a second claim it was the practice to brand murderers with the letter M, and other felons with the Tyburn T, and Ben Jonson was in 1598 so marked for manslaughter.

The reign of Henry VIII. was marked by extreme severity in the execution of criminals—as during this time 75,000 persons are said to have been hanged. After the formation of English settlements in America the severity of the law was mitigated by the practice of reprieving persons sentenced to death on condition of their consenting to be transported to the American colonies, and to enter into bond service there. The practice seems to have been borrowed from Spain, and to have been begun in 1597 (30 Eliz. c. 4.). It was applied by Cromwell during his campaign in Ireland, and was in full force immediately after the Restoration, and is recognized in the Habeas Corpus Act 1677, and was used for the Cameronians during Claverhouse’s campaign in south-west Scotland. In the 18th century the courts were empowered to sentence felons to transportation (see DEPORTATION) instead of to execution, and this state of the law continued until 1857 (6 Law Quarterly Review, p. 388). This power to sentence to transportation at first applied only to felonies with benefit of clergy; but in 1705, on the abolition of the necessity of proving capacity to read, all criminals alike became entitled to the benefit previously reserved to clerks. Benefit of clergy was finally abolished in 1827 as to all persons not having privilege of peerage, and in 1841 as to 10 peers and persons of peerage. The beneficial effect had not been exhausted, since no clergiable offences remained capital crimes.

At the end of the 18th century the criminal law of all Europe was ferocious and indiscriminate in its administration of capital punishment for almost all forms of grave crime; and yet owing to poverty, social conditions, and the inefficiency of the police, such forms of crime were far more numerous than they now are. The policy and righteousness of the English law were questioned as early as 1766 by Goldsmith through the mouth of the vicar of Wakefield: “Nor can I avoid even questioning the validity of that right which social combinations have assumed of capitaly punishing offences of a slight nature. In cases of murder their right is obvious, as it is the duty of us all from the law of self-defence to cut off that man who has shown a disregard for the
CAPITAL PUNISHMENT

life of another. Against such all nature rises in arms; but it is not so against him who steals my property.” He adds later: “When by indiscriminate penal laws the nation beholds the same punishment affixed to dissimilar degrees of guilt, the people are led to lose all sense of distinction in the crime, and this distinction is the bulwark of all morality.”

The opinion expressed by Goldsmith was strongly supported by Bentham, Romilly, Basil Montagu and Mackintosh in England, and resulted in considerable mitigation of the severity of the law. In 1800 over 200 and in 1819 about 180 crimes were capital. As the result of the labour of these eminent men and their disciples, and of Sir Robert Peel, there are now only four crimes (other than offences against military law or naval discipline) capital punishable in England—high treason, murder, piracy with violence, and destruction of public arsenals and dockyards (The Dockyards, &c., Protection Act 1772). An attempt to abolish the death penalty for this last offence was made in 1837, but failed, and has not since been renewed. In the case of the last two offences sentence of death need not be pronounced, but may be recorded (4 Geo. IV. c. 48). Since 1838 it has in practice been executed only for murder; the method being by hanging.

The change in the severity of the law is best illustrated by the following statistics:

During the twelve years from 1833 to 1844, 788 persons were committed for trial for murder, being an average of 65. The highest number was in 1895 (83) and the lowest in 1900 (57). Of those tried in 1904, 28 (26 males and 2 females) were convicted of murder, 16 (all males) were executed; 9 males and 2 females had their sentences commuted to penal servitude for life.

In Scotland capital punishment can be imposed only for treason, murder and offences against Geo. IV. c. 38, i.e, wilful shooting, stabbing, strangling or throwing corrosives with intent to murder, maim, disfigure, disable, or do grievous bodily harm, in all cases where if death had ensued the offence would have been murder. Prior to 1887 rape, robbery, wilful fire-raising and incest, and many other crimes, were also capital offences; but in practice the pains of law were restricted at the instance of the prosecution. The method is by hanging.

In Ireland capital punishment may be inflicted for the same offences as in England, except offences under the Dockyards Protection Act 1772, and it is carried out in the same manner.

Offences under Military Law.—Thus far only crimes against the ordinary law of the land have been dealt with. But both the Naval Discipline Act of 1866 and the Army Act empower courts-martial to pass sentence for a number of offences against military and naval laws. Such sentences are rarely if ever passed where an ordinary court is within reach, or except in time of war. The offences extend from traiotrion communication with the enemy and cowardice on the field to falling asleep while acting as a sentinel on active service. It is for the authority confirming a sentence of death by court-martial to direct the mode of execution, which both in the British and United States armies is usually by shooting or hanging. During the Indian Mutiny some mutineers were executed by being blown from the mouth of cannon. As to the history of military punishments see C Lowe, Military and Martial Law.

British Colonies and Possessions.—Under the Indian Penal Code sentence of death may be passed for waging war against the king (s. 121) and for murder (s. 302). If the murder is committed by a man under sentence of transportation for life the death penalty must be imposed (s. 303). In other cases it is alternative. This code has been in substance adopted in Ceylon, in Straits Settlements and Hong-Kong, and in the Sudan. In most of the British colonies and possessions the death penalty may be imposed only in the case of high treason, wilful murder and piracy with violence. But in New South Wales and Victoria sentence of death may be passed for rape and criminal abuse of girls under ten. In Queensland the law was the same until the passing of the Criminal Code of 1890.

Under the Canadan Criminal Code of 1892 the death sentence may be imposed for treason (s. 657), murder (s. 231), rape (s. 247), piracy with violence (s. 127), and upon subjects of a friendly power who levv war on the king in Canada (s. 68). But the judge is bound by statute to report on all death sentences, and the date of execution is fixed so as to give time for considering the report. The sentence is executed by hanging. In South Africa the criminal law is based on the Roman-Dutch law, under which capital punishment is liable for treason (crimen peractum or laesae majestatis), murder and rape (van Leeuwen, c. 36). In the Cape Colony rape is still capital (R. v. Newis, 1885; 1 Buchanan, 1898). In Natal rape may be punished by hanging (act no. 22, 1898). Though the Roman-Dutch modes of executing the sentence by decapitation or breaking on the wheel have not been formally abolished, in practice the sentence in the Cape Colony is executed by hanging. In the Transvaal hanging is now the sole mode of executing capital punishment (Criminal Procedure Code, 1903, s. 244). The Roman-Dutch law as to crime and punishments has been superseded in Ceylon and British Guiana by ordinance.

Austria-Hungary.—In Austria capital punishment was in 1787 for a time abolished, but was reintroduced in 1795 for high treason, and in 1803 for certain other crimes. Under the penal code still in force in 1906 it might be inflicted for the offences in the table given below, but not on offenders who were under twenty when they committed the offence. The annexed table indicates that the full sentence was sparingly executed. Under a Penal Code drafted in 1806, however, only two offences were made capital, viz. high treason against the person of the emperor and the graver cases of murder. The sentence is executed by hanging.

Belgium.—Under the Belgian Penal Code of 1867 the death penalty is retained for certain forms of high treason, and for assassination and parricide by poisoning. It may not be pronounced on a person under eighteen. The sentence is executed publicly by the guillotine. No execution seems to have taken place since 1865.

Denmark.—Sentence of death may be imposed for most forms of high treason, aggravated cases of murder, rape and piracy. It is executed publicly by the axe. Offenders under eighteen are not liable.

Finland.—In Finland the death penalty is alleged not to have been inflicted since 1824. It may be imposed for the assassination of the grand duke or grand duchess of the head of a friendly state, and wilful murder of other persons.

France.—Under the ancien régime in France, 115 crimes had become capital in 1789. The mode of execution varied, but in some cases it was effected by breaking on the wheel or being...
and was coupled with mutilation. Under the Penal Code of 1820, as amended in or after 1827, even so late as 1871, thirty offences were capital, one being perjury against a prisoner resulting in his condemnation to death (art. 236). At present it may be imposed for wounding a public official with intent to murder (art. 233), assassination, parricide, poisoning, killing to commit a crime or escape from justice (arts. 302, 304). But juries freely exercise the power of acquitting in capital cases, or of defeating the capital sentence by finding extenuating circumstances in more than seven-eighths of the cases, which compels the court to reduce the punishment by one or more degrees, i.e. below the penalty of death. And in recent times the prerogative of mercy has been continually exercised by the president, even in gross cases where public opinion demanded the extreme penalty. The sentence is executed in public by the guillotine.

Germ any.—In many of the states of Germany capital punishment had been abolished (Brunswick, Coburg, Nassau, Oldenburg in 1849; Saxe-Meiningen, Saxe-Weimar, 1862; Baden, 1863; Saxony, 1868). But it has been restored by the Imperial Criminal Code of 1872, in the case of attempts on the life of the emperor, or of the sovereign of any federal state in which the offence has been committed (s. 208), and for deliberate homicide (s. 211) as opposed to intentional homicide without deliberation—and for certain treasonable acts committed when a state of siege has been proclaimed. The sentence is executed by beheading (s. 13).

Holland.—In Holland there have been no executions since 1860. Capital punishment (by hanging) was abolished in 1870, and was not reintroduced in the Penal Code of 1886.

Italy.—Capital punishment was abolished in Tuscany as far back as 1786, and from Italy has come the chief opposition to the death penalty, originated by Beccaria, and supported by many eminent jurists. Under the Penal Code of 1888 the death penalty was abrogated for all crimes, even for regicide. The cases of homicide in Italy are very numerous compared with those in England, amounting in 1905 to 105 per million as compared with 27 per million in the United Kingdom.

Japan.—The penalty of death is executed by hanging within a prison. It may be imposed for executing or contriving acts of violence against the mikado or certain of his family, and for sedition in violence with the object of seizing the territory or subverting the government or laws of Japan, or conspiring with foreign powers to commence hostilities against Japan. It is inflicted for certain forms of homicide, substantially wilful murder in the first degree.

Norway.—Under Norwegian law, up to 1905, sentence of death might be passed for murder with premeditation, but the court might as an alternative decree penal servitude for life. Sentence of death had also to be passed in cases where a person under sentence of penal servitude for life committed murder or culpable homicide, or caused bodily injuries in circumstances warranting a sentence of penal servitude for life, or committed robbery or the grosser forms of wilful fire-raising. The sentence was carried out by decapitation (see Beheading); but there had been no execution since 1876. The new Norwegian Code, which came into force on the 6th of January 1905, abolished capital punishment.

Portugal.—There has been considerable objection in Portugal to capital punishment, and it was abolished in 1867.

Rumania.—Capital punishment was abolished in 1864.

Russia.—In 1870, under the empress Elizabeth, capital punishment was abolished; but it was restored later and was freely inflicted, the sentence being executed by shooting, beheading or hanging. According to a Home Office Return in England in 1907 the death penalty is abolished, except in cases where the lives of the emperor, empress or heir to the throne are concerned.

Spain.—Under the Spanish Penal Code of 1870 the following crimes are capital—inducing a foreign power to declare war against Spain, killing the sovereign, parricide and assassination. The method employed is execution in public by the garrote. But the death sentence is rarely imposed, the customary penalty for murder being penal servitude in chains for life, while a parricide is imprisoned in chains “in perpetuity until death.”

Sweden.—The severity of the law in Sweden was greatly mitigated so far back as 1777. Under the Penal Code of 1864, the penalty of death may be imposed for certain forms of treason, including attempts on the life of the sovereign or on the independence of Sweden, and for premeditated homicide (assassinal), and in certain cases for offences committed by persons under sentence of imprisonment for life. In 1901 a bill to abolish capital punishment was rejected by both houses of the Swedish parliament.

Switzerland.—Capital punishment was abolished in Switzerland in 1874 by Federal legislation; but in 1879, in consequence of a plebiscite, each canton was empowered to restore the death penalty for offences in its territory. The Federal government was unwilling to take this course, but was impelled to it by the fact that, between 1874 and 1879, cases of premeditated murder had considerably increased. Seven of the cantons out of twenty-two have exercised the power given to restore capital punishment. But there do not seem to have been any cases in which the death penalty has been inflicted; and on the abolition of the empress of Austria at Geneva in 1898 it was assumed that the laws of the canton did not permit the execution of the assassin. The canton of Zug imposes the lowest minimum penalty known, i.e. three years’ imprisonment for wilful homicide, the maximum being imprisonment for life.

United States of America.—Under the Federal laws sentence of death may be passed for treason against the United States and for piracy and for murder within the Federal jurisdiction. But for the most part the punishment of crime is regulated by the laws of the constituent states of the Union.

The death penalty was abolished in Michigan in 1846 except for treason, and wholly in Wisconsin in 1853. In Maine it was abolished in 1876, re-enacted in 1883, and again abolished in 1887. In Rhode Island it was abolished in 1852, but restored in 1882, only in case of murder committed by a person under sentence of imprisonment for life (Laws, 1866, c. 277, s. 2). In all the other states the death penalty may still be inflicted: in Alabama, Delaware, Georgia, Maryland, and West Virginia, for treason, murder, arson and rape; in Alaska, Arizona, Kansas, New Jersey, Mississippi, Montana, New York, North Dakota, Oregon, and South Dakota, for treason and murder; in Colorado, Idaho, Illinois, Iowa, Massachusetts, Minnesota, Nebraska, New Hampshire, New Mexico, Nevada, Ohio, Oklahoma, Pennsylvania, Utah and Wyoming, for murder only; in Kentucky and Virginia, for treason, murder and rape; in Vermont, for treason, murder and arson; in Indiana, for treason, murder, and for arson if death result; in California, for treason, murder and train-wrecking; in North Carolina, for murder, rape, arson and burglary; in Florida, Missouri, South Carolina, Tennessee and Texas, for murder and rape; in Arkansas and Louisiana, for treason, murder, rape, and administering poison or use of dangerous weapons with intent to murder. Louisiana is cited by Girardin (le droit de punir) as a state in which the death penalty was abolished in 1830. Under the influence of the eminent jurist, E. Livingston, who framed the state codes, the legislature certainly passed a resolution against capital punishment. But since as early as 1846 it has been there lawful, subject to a power given to the jury, to bring in a verdict of guilty, “but no capital punishment,” which had the effect of imposing a sentence of hard labour for life. In certain states the jury has, under local legislation, the right to award the sentence. The constitutionality of such legislation has been doubted, but has been recognized by the courts of Illinois and Iowa. Sentence of death is executed by hanging, except in seven of the states, where it is carried out by electrocution (g.v.).

With the mitigation of the law as to punishment, agitation against the theory of capital punishment has lost much of its force. But many European and American writers, and some English writers and associations, advocate the total abolition of the death punishment. The ultimate argument of the opponents of capital punishment is that society has no right to take the life of any one of its members on
any ground. But they also object to capital punishment: (1) on religious grounds, because it may deprive the sinner of his full time for repentance; (2) on medical grounds, because homicide is usually if not always evidence of mental disease or irresponsibility; (3) on utilitarian grounds, because capital punishment is not really deterrent, and is actually inflicted in so few instances that criminals discount the risks of undergoing it; (4) on legal grounds, i.e. that the sentence being irrevocable and the evidence often circumstantial only, there is great risk of gross injustice in executing a person convicted of murder; (5) on moral grounds, that the punishment does not fit the case nor effect the reformation of the offender. It is to be noted that the English Children Act 1908 expressly forbids the pronouncing or recording the sentence of death against any person under the age of sixteen (s. 103).

The punishment is probably retained, partly from ingrained habit, partly from a sense of its appropriateness for certain crimes, but also that the ultima ratio may be available in cases of sufficient gravity to the commonweal. The apparent discrepancy between the number of trials and convictions for murder is not in England any evidence of hostility on the part of juries to capital punishment, which has on the whole lessened rather than increased since the middle of the 19th century. It is rather seen in the way in which the jury in the modern English case seek to question the jurors as to their views on capital punishment. The reasons for the comparatively small number of convictions for murder seem to be: (1) that court and jury in a capital case lean in favorem vitae, and if the offence falls short of the full gravity of murder, conviction for manslaughter only results; (2) that in the absence of a statutory classification of the degrees of murder, the prerogative of mercy is exercised in cases falling short of the highest degree of gravity recognized by lawyers and by public opinion; (3) that where the conviction rests on circumstantial evidence the sentence is not executed unless the circumstantial evidence is conclusive; (4) that charges of infanticide against the mothers of illegitimate children are treated mercifully by judge and jury, and usually terminate in acquittal, or in a conviction of concealment of birth; (5) that many persons tried as murderers are obviously insane; (6) that coroners' juries are somewhat recklessly free in returning inquisitions of murder without any evidence which would warrant the conviction of the person accused.

The medical doctrine, and that of Lombroso with respect to criminal atavism and irresponsibility, have probably tended to influence the public in the same favour of capital punishment, and Sir James Stephen and other eminent jurists have even been thereby tempted to advocate the execution of habitual criminals. It certainly seems strange that the community should feel bound carefully to preserve and tend a class of dangerous lunatics, and to give them, as Charles Kingsley says, "the finest air in England and the right to kill two gaolers a week."

The whole question of capital punishment in the United Kingdom was considered by a royal commission appointed in 1864, which reported in 1866 (Parl. Pap., 1866, 10,438). The commission took the opinions of all the judges of the supreme courts in the United Kingdom and of many other eminent persons, and collected the laws of other countries so far as this was ascertainable. The commissioners differed on the question of the expediency of abolishing or retaining capital punishment, and did not report thereon. But they recommended: (1) that it should be restricted throughout the United Kingdom to high treason and murder; (2) alteration of the law of homicide so as to classify homicides according to their gravity, and to confine capital punishment to murder in the first degree; (3) modification of the punishment of capital murder, and of infanticide as misdemeanours; (4) authorizing judges to direct sentence of death to be recorded; (5) the abolition—since carried out—of public executions.

CAPITO (or KÖPFL), WOLFGANG [Fabriciusi] (1478-1541), German reformer, was born of humble parentage at Hagena in Alsace. He was educated for the medical profession, but also studied law, and applied himself so earnestly to theology that he received the doctorate in that faculty also, and, having joined the Benedictines, taught for some time at Freiburg. He acted for three years as pastor in Bruchsal, and was then called to the cathedral church of Basel (1532). Here he made the acquaintance of Zwingli and began to correspond with Luther. In 1519 he removed to Mainz at the request of Albrecht, archbishop of that city, who soon made him his chancellor. In 1523 he settled at Strassburg, where he remained till his death in November 1541. He had found it increasingly difficult to reconcile the new religion with the old, and from 1524 was one of the leaders of the reformed faith in Strassburg. He took a prominent part in the earlier ecclesiastical transactions of the 16th century, was present at the second conference of Zürich and at the conference of Marburg, and along with Martin Bucer was among the last to take part in the controversy with Luther. It seems probable, however, that he may have been more concerned for the "unity of the spirit" than for dogmatic formulaires, and from his endeavours to conciliate the Lutheran and Zwinglian parties in regard to the sacraments, it seems to have inured the suspicions of his own friends; while from his intimacy with Martin Cellarius and other divines of the Socinian school he drew on himself the charge of Arianism. His principal works were:—Institutionum Hebraicarum libri duo; Enarrationes in Habacuc et Hoseam Prophetas; a Life of Oecolampadius and an account of the synod of Berne (1532).

CAPITULARY (Med. Lat. capitularium), a series of legislative or administrative acts emanating from the Merovingian and Carolingian kings, so called as being divided into sections or chapters (capitula). With regard to these capitularies two questions arise: (1) as to the means by which they have been handed down to us; (2) as to their true character and scope. (1) As soon as the capitulary was composed, it was sent to the various functionaries of the Frankish empire, archbishops, bishops, missi and counts, a copy being kept by the chancellor in the archives of the palace. At the present day we do not possess a single capitulary in its original form: but very much of the substance of the isolated capitularies is found in various scattered manuscripts, among pieces of a very different nature, ecclesiastical or secular. We find, therefore, a fair number of them in books which go back as far as the 9th or 10th centuries. In recent editions in the case of each capitulary it is carefully indicated from what manuscripts it has been collated.

These capitularies make provisions of a most varied nature; it was therefore found necessary at quite an early date to classify them into chapters according to the subject. In 827 Ansegisius, abbot of St Wandrille at Fontenelle, made such a collection. He embodied them in four books: one of the ecclesiastical capitularies of Charlemagne, one of the ecclesiastical capitularies of Louis the Pious, one of the secular capitularies of Charlemagne, and one of the secular capitularies of Louis, bringing together similar provisions and suppressing duplicates. This collection soon gained an official authority, and after 829 Louis the Pious refers to it, citing book and section.

After 827 new capitularies were naturally promulgated, and before 858 there appeared a second collection in three books, by an author calling himself Benedictus Levita. His aim was, he said, to complete the work of Ansegisius, and bring it up to date by continuing it from 827 to his own day; but the author has not only borrowed prescriptions from the capitularies; he has introduced other documents into his collection, fragments of Roman laws, canons of the councils and especially spurious provisions very similar in character to those of the same date found in the False Decretals. His contemporaries did not notice these spurious documents, but accepted the whole collection as
authentic, and incorporated the four books of Ansegisus and the three of Benedictus Levita into a single collection in seven books. The serious historian of to-day, however, is careful not to use books v., vi. and vii. for purposes of reference.

Early editors chose to republish this collection of Ansegisus and Benedictus as they found it. It was a distinguished French scholar, Étienne Baluze, who led the way to a fresh classification. In 1677 he brought out the *Capitularia regum francorum*, in two folio volumes, in which he published first the capitularies of the Merovingian kings, then those of Pippin, of Charles and of Louis the Pious, which he had found complete in various manuscripts. After the date of 840, he published as supplements the unreliable collection of Ansegisus and Benedictus Levita, with the warning that the latter was quite untrustworthy. He then gave the capitularies of Charles the Bald, and of other Carolingian kings, either contemporaries or successors of Charles, which he had discovered in various places. A second edition of Baluze was published in 1786 in 2 volumes folio by Pierre de Chinnic.

The edition of the Capitularies made in 1835 by George Pertz, in the *Monumenta Germaniae* (folio edition, vol. i. of the *Lagis*) was not much advance on that of Baluze. A fresh revision was required, and the editors of the *Monumenta* decided to reissue it in their quarto series, entrusting the work to Dr Alfred Boretius. In 1883 Boretius published his first volume, containing all the detached capitularies up to 827, together with various appendices bearing on them, and the collection of Ansegisus. Boretius, whose health had been ruined by overwork, was unable to finish his work; it was continued by Victor Krause, who collected in vol. ii. the scattered capitularies of a date posterior to 828. Karl Zeumer and Albrecht Werminghoff drew up a detailed index of both volumes, in which all the essential words are noted. A third volume, prepared by Emil Seckel, was to include the collection of Benedictus Levita.

(2) Among the capitularies are to be found documents of a very varied kind. Boretius has divided them into several classes:

(a) *The Capitula legis addenda.*—These are additions made by the king of the Franks to the barbarian laws promulgated under the Merovingians, the Salic law, the Ripuarian or the Bavarian. These capitularies have the same weight as the law which they complete; they are particular in their application, applying, that is to say, only to the men subject to that law. Like the laws, they consist chiefly of scales of compensation, rules of procedure and points of civil law. They were solemnly promulgated in the local assemblies where the consent of the people was asked. Charlemagne and Louis the Pious seem to have made efforts to bring the other laws into harmony with the Salic law. It is also to be noted that by certain of the capitularies of this class, the king adds provisions affecting, not only a single law, but all the laws in use throughout the kingdom.

(b) *The Capitula ecclesiastica.*—These capitularies were elaborated in the councils of the bishops; the kings of the Franks sanctioned the canon of the councils, and made them obligatory on all the Christians in the kingdom.

(c) *The Capitula missorum et scribenda.*—These embodied political decrees which all subjects of the kingdom were bound to observe. They often bore the name of edictum or of constitutio, and the provisions made in them were permanent. These capitularies were generally elaborated by the king of the Franks in the autumn assemblies or in the committees of the spring assemblies. Frequently we have only the proposition made by the king to the committee, capitula tractanda cum comitibus, episcopis, et abbatis, and not the final form which was adopted.

(d) *The Capitula missorum*, which are the instructions given by Charlemagne and his successors to the missi sent into the various parts of the empire. They are sometimes drawn up in common for all the missi of a certain year—capitula missorum generalia; sometimes for the missi sent only on a given circuit—capitula missorum specialia. These instructions sometimes hold good only for the circuit of the missus; they have no general application and are merely temporary.

(e) With the capitularies have been incorporated various documents; for instance, the rules to be observed in administering the king's private domain (the celebrated capitulary de villis, which is doubtless a collection of the instructions sent at various times to the agents of these domains); the partitions of the kingdom among the king's sons, as, the *Divisio regnum* of 806, or the *Ordinatio imperii* of 817; the oaths of peace and brotherhood which were taken on various occasions by the sons of Louis the Pious, &c.

The merit of clearly establishing these distinctions belongs to Boretius. He has doubtless exaggerated the difference between the *Capitula missorum* and the *Capitula per se scribenda*; among the first are to be found provisions of a general and permanent nature, and among the second temporary measures are often included. But the idea of Boretius is none the less fruitful. In the capitularies there are usually permanent provisions and temporary provisions intermingled; and the observation of this fact has made it possible more clearly to understand certain institutions of Charlemagne, e.g. military service.

After the reign of Louis the Pious the capitularies became long and diffuse. Soon, from the 10th century onwards, no provision of general application emanates from the kings. Henceforth the kings only regulated private interests by charters; it was not until the reign of Philip Augustus that general provisions again appeared; but when they did so, they bore the name of ordinances (ordinances).

There were also capitularies of the Lombards. These capitularies formed a continuation of the Lombard laws, and are printed as an appendix to these laws by Boretius in the folio edition of the *Monumenta Germaniae*, Leges, vol. iv.

**AUTHORITIES.**—Boretius, *Die Capitulare im Longobardenreich* (Halle, 1864); and Beiträge zur Capitulareinrichtung (Leipzig, 1874); G. Seeliger, *Die Capitulare der Karolinger* (Munich, 1893). See also the histories of capitularies or of law by Waitz, Bruner, Fustel de Coulanges, Voltz, Esmen. (C. Fr.)

**CAPITULATION** (Lat. *capitulum*, a little head or division; *capitulare*, to treat upon terms), an agreement in time of war for the surrender to a hostile armed force of a particular body of troops, a town or a territory. It is an ordinary incident of war, and therefore no previous instructions from the captor's government are required before finally settling the conditions of capitulation. The most usual of such conditions are freedom of religion and security of private property on the one hand, and a promise not to bear arms within a certain period on the other. Such agreements may be rashly concluded with an inferior officer, on whose authority the enemy are not in the actual position of the war entitled to place reliance. When an agreement is made by an officer who has not the proper authority or who has exceeded the limits of his authority, it is termed a *spesone*, and, to be binding, must be confirmed by express or tacit ratification. Article 35 of the Hague Convention (1899) on the laws and the customs of war lays down that "capitulations agreed on between the contracting parties must be in accordance with the rules of military honour. When once settled they must be observed by both the parties."

In a word, capitulation is the name given to an arrangement by which foreigners are withdrawn, for most civil and criminal purposes, from the jurisdiction of the state making the capitulation. Thus in Turkey arrangements termed capitulations (q.v.), and treaties confirmatory of them, have been made between the Porte and other states by which foreigners resident in Turkey are subject to the laws of their respective countries. The term is also applied by French writers to the oath which on his election the Holy Roman emperor used to make to the college of electors; this related chiefly to such matters as regalian rights, appeals from local jurisdictions, the rights of the pope, &c.

**CAPITULATIONS** (from Lat. *caput*, or its Low-Latin diminutive *capitulum*, as indicating the form in which these acts were set down in "chapters"; the Gr. equivalent *sephaleion*, *kephalaios*, is occasionally used in works of the 17th century), treaties granted by a state and conferring the privilege of extra-territorial jurisdiction within its boundaries on the subjects of another state. Thus, in the 9th century, the caliph Harun-al-Rashid granted to commercial and public services such as...
Franks, subjects of the emperor Charlemagne, as should visit the East with the authorization of their emperor. After the break-up of the Frank empire, similar concessions were made to some of the practically independent Italian cities that grew up on its ruins. Thus, in 1098, the prince of Antioch granted a charter to this nature to the city of Genoa; the king of Jerusalem extended the same privilege to Venice in 1123 and to Marseilles in 1136. Salah-ad-din (Saladin), sultan of Babylon (Cairo), granted a charter to the town of Pisa in 1173. The Byzantine emperors followed this example, and Genoa, Pisa and Venice all obtained capitulations. The explanation of the practice is to be found in the fact that the sovereignty of the state was held in those, the common interest of the French and Turkey in over-throw, Charles V's overwhelming power was successful; the secret mission of Frangipani, an unofficial envoy who could be disowned in case of failure, paved the way for De la Forest's embassy in 1534, and in 1536 the capitulations were signed. They amounted to a treaty of commerce and a treaty allowing the establishment of Frenchmen in Turkey and fixing the jurisdiction to be exercised over them: individual and religious liberty is guaranteed to them, the king of France is empowered to appoint consuls in Turkey, the consuls are recognized as competent to judge the civil and criminal affairs of French subjects in Turkey according to French law, and the consuls may appeal to the officers of the sultan for their aid in the execution of their sentences. This, the first of the capitulations, is practically the prototype of its successors. Five years later, similar capitulations were concluded with Venice. The capitulations were at first held to be in force only during the lifetime of the sultan by whom they were granted; thus in 1569 Sultan Selim II. renewed the French capitulations granted by his predecessor. In 1583 England obtained her first capitulation, until which time France had been the official protector of all Europeans established in Turkey. Later on, England claimed to protect the subjects of other nations, a claim which is rejected in the French capitulations of 1597, 1603 and 1605, the last-named of which explicitly lays down that the subjects of all nations not represented at Constantinople by an ambassador shall be under French protection. In 1613 Holland obtained her first capitulation, with the assistance of the French ambassador, anxious to help a commercial rival of England. In 1673 the French, represented by the marquis de Noîntel, succeeded in obtaining the renewal of the capitulations which, for various reasons, had remained unconfirmed since 1607. Louis XIV. had been anxious to secure the protectorate of all Catholics in Turkey, but was obliged to content himself with the recognition of his right to protect all Latins of non-Turkish nationality; his claims for the restoration to the Catholics of the Holy Places usurped by the Greeks was also rejected, the sultan only undertaking to promise to restore their churches to the Jesuit Capuchins. An important commercial gain was the reduction of the import duties from 5 to 3%; and all suits the value of which exceeded 4000 aspers in which French subjects sued, or were sued by, an Ottoman subject, were to be heard not by the ordinary tribunals but at the Porte itself. Later, France's friendship secured for Turkey a successful negotiation of the peace of Belgrade in 1739, and the result was the capitulation of 1740; this is no longer limited in duration to the sultan's lifetime but is made perpetual, and, moreover, declares that it cannot be modified without the assent of the French. It conferred on the French ambassador precedence over his colleagues. Austria had obtained capitulations in 1718, modified in 1784; Russia secured similar privileges in 1764. In the course of the 18th century nearly every European power obtained these, and such newly-established countries as the United States of America, Belgium and Greece followed in the 19th century.

The chief privileges granted under the capitulations to foreigners resident in Turkey are the following: liberty of residence, inviolability of domicile, liberty to travel by land and sea, freedom of commerce, freedom of religion, immunity from local jurisdiction save under certain safeguards, exclusive extra-territorial jurisdiction over foreigners of the same nationality, and competence of the forum of the defendant in cases in which two foreigners are concerned, though the Sublime Porte has long claimed to exercise jurisdiction in criminal cases in which two foreigners of different nationality are concerned—the capitulations are silent on the point and the claim is resisted by the powers.

The same system has been followed by such countries as Persia, China, Japan and Siam.

The practical result of the capitulations in Turkey is to form each separate foreign colony into a sort of imperium in imperio, and to hamper the local jurisdiction very considerably. As the power of the sultan is thus transferred to the capitulations progresses in civilization it chafes under these restraints in its sovereignty. Turkey's former vassals, Rumania and Servia, though theoretically bound to respect the capitulations so long as they formed part of Turkey, had practically abrogated them long before securing their independence through the treaty of Berlin in 1878. The same may be said of Bulgaria. Japan was liberated from the burden of the capitulations some years ago.

The extra-territorial jurisdiction exercised by the foreign powers over their subjects in Turkey and other countries where capitulations exist is regulated by special legislative enactments; in the case of the United Kingdom by orders in council.

In Turkey the capitulations are practically the only treaties in force with the powers, since the expiration about 1859 of the commercial treaties concluded in 1861-1862. As they all contain the "most-favoured nation" clause, the privileges in any one apply to all the powers, though not always claimed. Thus America and Belgium claim under their treaties with Turkey the right to try all their subjects, even if accused of offences against Ottoman subjects—a claim recently made by Belgium against the American subject Josef, accused of participation in the bomb outrage of 1905 at Yildiz. One peculiar privilege granted in the capitulations of 1675 (Art. 74) authorizes the king of England to buy in Turkey with his own money two cargoes of figs and raisins, in fertile and abundant years and not in times of dearth or scarcity, and provides that after a duty of 3% has been paid thereon no obstacle or hindrance shall be given thereto.

CÁPIZ, a town and the capital of the province of Cápiz, Panay, Philippine Islands, on the Cápiz or Panay river, about 4 m. from its mouth on the N. coast. Pop. (1903) 18,525. Cápiz has a large and beautiful Roman Catholic church (of stone), a Protestant church (with a hospital) and good government buildings, and is the seat of the provincial high school. Alcohol of a superior quality is manufactured in large quantities from the fermented juice of the nipa palm, which grows plentifully in the neighbouring swamps. Fishing and the weaving of fabrics of cotton, hemp and pineapple fibre are important industries. Rice and sugar are raised in abundance. Tobacco, Indian com

1 La Forest, a knight of St John of Jerusalem, was the first resident ambassador of France at Constantinople. He died in 1557.
and cacao are produced to a limited extent; and rice, alcohol, sugar and copra are exported. Coasting vessels ascend the river to the town. The language is Visayan.

CAPMANY Y MONTALAU, ANTONIO DE (1742-1813), Spanish polygraph, was born in Barcelona on the 24th of November 1742. He retired from the army in 1770, and was subsequently elected secretary of the Royal Academy of History at Madrid. His principal works are — Memorias históricas sobre la marina, comercio, y artes de la antigua ciudad de Barcelona (4 vols. 1779-1793); Teatro histórico-crítico de la eloquencia Española (1786); Filosofía de la eloquencia (1776), and Cuestiones críticas sobre varios puntos de historia económica, política, y militar (1807). Capmany died at Barcelona on the 14th of November 1813. His monograph on the history of his birthplace still preserves much of its original value.

CAPO D’ISTRIA, GIOVANNI ANTONIO [Ioannes], Count (1776-1831), Russian statesman and president of the Greek republic, was born at Corfu on the 11th of February 1776. He belonged to an ancient Corfiot family which had immigrated from Istria in 1373, the title of count being granted to it by Charles Emmanuel, duke of Savoy, in 1689. The father of Giovanni Caipo d’Istria was a man of considerable importance in the island, a stiff aristocrat of the old school, who in 1798, after the treaty of Campo Formio had placed the Ionian Islands under French rule, was imprisoned for his opposition to the new régime, his release next year being the earliest triumph of his son’s diplomacy. On the establishment in 1800, under Turkish suzerainty, of the septinsular republic—a settlement negotiated at Constantinople by the elder Caipo d’Istria—Giovanni, who had meanwhile studied medicine at Padua, entered the government service as secretary to the legislative council, and in one capacity or another exercised for the next seven years a determining voice in the affairs of the republic. At the beginning of 1807 he was appointed “extraordinary military governor” to organize the defence of Santa Maura against Ali Pasha of Janina, an enterprise which brought him into contact with Theodoros Kolokotrones and other future chiefs of the wars of Greek independence, and awoke in him that wider Hellenic patriotism which was so largely to influence his career.

Throughout the period of his official connexion with the Ionian government Caipo d’Istria was the constant and public to the Russian influence in the islands; and when the treaty of Tilsit (1807) dashed his hopes by handing over the Ionian republic to Napoleon, he did not relinquish his belief in Russia as the most reliable ally of the Greek cause. He accordingly refused the offers made to him by the French government, and accepted the invitation of the Russian chancellor Romanzov to enter the tsar’s service. He went to St Petersburg in 1809, and was appointed to the honorary post of attaché to the foreign office, but it was not till two years after, in 1811, that he was actually employed in diplomatic work as attaché to Baron Stackelberg, the Russian ambassador at Vienna. His knowledge of the near East was here of great service, and in the following year he was attached, as chief of his diplomatic bureau, to Admiral Chichagov, on his mission to the Danubian principalities to stir up trouble in the Balkan peninsula as a diversion on the flank of Austria, and to attempt to supplement the treaty of Bucharest by an offensive and defensive alliance with the Ottoman empire. The Moscow campaign of 1812 intervened; Chichagov was disgraced in consequence of his failure to depose Napoleon, but Caipo d’Istria was not involved, was made a councillor of state and continued in his diplomatic functions. During the campaign of 1813 he was attached to the staff of Barclay de Tolly and was present at the battles of Lützen, Bautzen, Dresden and Leipzig. With the advance of the allies he was sent to Switzerland to secure the withdrawal of the republic from the French alliance. Here, in spite of his instructions to guarantee the neutrality of Switzerland, he signed on his own responsibility the proclamation issued by Prince Schwarzenberg, stating the intention of the allied troops to march through the country. His motive was to prevent any appearance of disaffection among the allies. The emperor Alexander, to whom he hastened to make an explanation in person, endorsed his action.

Capo d’Istria was present with the allies in Paris, and after the signing of the first peace of Paris he was rewarded by the tsar with the order of St Vladimir and his full confidence. At the congress of Vienna his influence was conspicuous; he represented the tsar on the Swiss committee, was associated with Rasumovsky in negotiating the tangled Polish and Saxon questions, and was the Russian plenipotentiary in the discussions with the Baron von Stein on the affairs of Germany. His Memoire sur l’Empire germanique, of the 9th of February 1815, presented to the tsar, was based on the policy of keeping Germany weak in order to secure Russian preponderance in its councils. It was perhaps from a similar motive that, after the Waterloo campaign, he strenuously opposed the proposals for the dismemberment of France. It was on his advice that the duc de Richelieu persuaded Louis XVIII. to write the autograph letter in which he declared his intention of resigning rather than submit to any diminution of his authority. The tsar, having felt himself bound by his ancestors’ word, at the treaty of Vienna 1815, which formed the basis of the effective concert of Europe, was also largely his work.

On the 26th of September 1815, after the proclamation of the Holy Alliance on the plain of Vertus, Capo d’Istria was named a secretary of state. On his return to St Petersburg, he shared the ministry of foreign affairs with Count Nesselrode, though the latter as senior signed all documents. Capo d’Istria, however, had sole charge of the newly acquired province of Bessarabia, which he governed conspicuously well. In 1818 he attended the emperor Alexander at the congress of Aix-la-Chapelle, and in the following year obtained leave to visit his home. He travelled by way of Venice, Rome and Naples, his progress exciting the liveliest apprehensions of the powers, notably of Austria. The “Jacobin” pose of the tsar was notorious, his all-embracing ambition hardly less so; and Russian travellers in Italy, notably the emperor’s former tutor, César de Laharpe, were little careful in the expression of their sympathy for the ideals of the Carbonari. In Metternich’s eyes Capo d’Istria was the object of the monuments of grief and responsibility for the tsar’s vagaries, the fount of all the ills with which Russia was sick; and, for all the count’s diplomatic reticence, the Austrian spies who dogged his footsteps earned their salaries by reporting sayings that set the reactionary courts in a flutter. For Metternich the overthrow of Capo d’Istria’s influence became a necessity of political salvation. At Corfu Capo d’Istria became the repository of all the grievances of his countrymen against the robust administration of Sir Thomas Maitland. At the congress of Vienna the count had supported the British protectorate over the Ionian Islands, the advantages of which from the point of view of trade and security were obvious; but the drastic methods of “King Tom’s” government, symbolized by a galloway for pirates and other evil-doers in every popular gathering place, offended his local patriotism. He submitted a memorandum on the subject to the tsar, and before returning to Russia travelled via Paris to England to lay the grievances of the Ionians before the British government. His reception was a cold one, mainly due to his own disingenuousness, for he refused to let Metternich the memorandum which he had already submitted to the Russian emperor; it was intended only for his own private use. The whole thing seemed, rightly or wrongly, an excuse for the intervention of Russia in affairs which were by treaty wholly British.

On his return to St Petersburg in the autumn of 1819, Capo d’Istria resumed his influence in the intimate counsels of the tsar. The murder of the Russian agent, Kotzebue, in March, had shaken but not destroyed Alexander’s liberalism, and it was Capo d’Istria who drew up the emperor’s protest against the Carlsbad decrees and the declaration of his adherence to constitutional views (see Alexander I.). In October 1820 Capo d’Istria

1 After his election to the Greek presidency in 1827, Capo d’Istria, whose baptismal names were Giovanni Antonio, signed himself Joannes Capodistrias, the form by which he is very commonly known.
d'Istria accompanied the tsar to the congress at Troppau. The events of the year—the murder of the duc de Berry in March, the Revolutions in Spain and in Naples—had produced their effect. Alexander was, in Metternich's exultant language, "a changed man," and Capo d'Istria apparently shared his conversion to reactionary principles. The Austrian chancellor now put forth all his powers to bring Alexander under his own influence, and to overthrow Capo d'Istria, whom he despised, distrusted and feared. In 1821 Alexander Ypsilanti's misguided raid into the Danubian principalities gave him his opportunity. The news reached the tsar at the congress of Laibach, and to Capo d'Istria was entrusted the task of writing the letter to Ypsilanti in which the tsar repudiated his claim, publicly proclaimed that he had the sympathy and support of Russia. For a while the position of Capo d'Istria was saved; but it was known that he had been approached by the agent of the Greek Heaumia before Ypsilanti, and that he had encouraged Ypsilanti to take up the ill-fated adventure which he himself had refused; he was hated at the Russian court as an upstart Greek, and Metternich was never weary of impressing on all and sundry that he was "using Russian policy for Greek ends." At last nothing but long habit and native loyalty to those who had served him well, prevented Alexander from parting with a minister who had ceased to possess his confidence. Capo d'Istria, anticipating his dismissal, resigned on the eve of the tsar's departure for the congress of Verona (1822), and retired into private life at Geneva. On the 11th of April 1827, the Greek national assembly at Troezen elected Capo d'Istria president of the republic. The vote was a triumph for the Russian faction, for the count, even after his fall, had not lost the personal regard of the emperor Alexander, nor ceased to consider himself a Russian official. He accepted the offer, but was in no hurry to take up the thankless task. In July he visited the emperor Nicholas I. at Tsarskoye Selo, receiving permission to proceed and instructions as to the policy he should adopt, and he next made a tour of the court of Europe in search of moral and material support. The news of the battle of Navarino (27th October 1822) hastened his arrival; the British frigate "Waspire" was placed at his disposal to carry him to Greece, and on the 19th of January 1828 he landed at Nauplia.

Capo d'Istria's rule in Greece had to contend against immense difficulties—the utter poverty of the treasury, the barbarism of the people but recently emancipated, the continued presence of Ibrahim Pasha, with an unwieldy army, in the south of the Morea. His strength lay in his experience of affairs and in the support of Russia; but he was by inheritance an aristocrat and by training an official, lacking in broad human sympathy, and therefore little fitted to deal with the wild and democratic elements of the society it was his task to control. The Greeks could understand the international status given to them by his presidency, and for a while the enthusiasm evoked by his arrival made him master of the situation. He thoroughly represented Greek aspirations, and his refusal to compromise the narrow limits which the powers, in successive protocols, sought to impose on the new state (see Greece). But the Russian administrative system by which he sought to restrain the native turbulence was bound in the end to be fatal to him. The wild chiefs of the revolution won over at first by their inclusion in his government, were offended by his European airs and Russian uniform, and alienated by his preference for the educated Greeks of the Phanar and of Corinth, his promotion of his Brothers Vaiaro and Agostino to high commands causing special offence. Dissatisfaction ended in open rebellion; the islands revolted; Capo d'Istria called in the aid of the Russian admiral; and Miaoulis, the hero of the Greek war at sea, blew up the warships under his command to prevent their falling into the hands of the government. On land, so far as the president was concerned, the climax was reached with the attempt to coerce the Mavromichales of the Mani, the bravest and most turbulent of the mountain clans, whose chief Petros Mavromichales, commonly known as Petroby, had played a leading part in the War of Independence. The result was an insurrection in the Mania (Easter, 1829), and the imprisonment of those of the Mavromichales, including Petroby, who happened to be in the power of the government. At the news of their chiefman's imprisonment the Mavromichales, who had for a while been pacified, once more flew to arms and threatened to march on Nauplia; but negotiations were opened, and on the advice of the Russian minister Petroby consented to make his submission to the president. Unhappily, when he was brought under guard to the appointed interview, Capo d'Istria, in a moment of irritation and weariness, refused to see him. Maddened with rage at this insult from a man who had not struck a blow for Greece, the proud old chief, on his way back to prison, caused out to two of his kinsmen, his son George and his brother Constantine, "You see how I fare," and passed on. According to the code of the Mania this was a command to take revenge. Next day, the 9th of October 1831, the two placed themselves at the door of the church where Capo d'Istria was accustomed to worship. As he passed in Constantine shot him down, and as he fell George thrust a dagger into his heart.

AUTHORITIES.—Carl W. P. Mendelssohn- Bartholdy's Graf Johann Capodistrias (Berlin, 1864) is based on all the sources, printed and unprinted, available at the time of publication, and contains an excellent guide to these. This may be supplemented by the historical sections of F. de Marten's Recueil des traités conclus par la Russie, &c. A short sketch of the life of Capo d'Istria will be found in W. Allan Phillips's The War of Greek Independence (London, 1897). Many of Capo d'Istria's despatches, &c., are published in the collections of diplomatic correspondence mentioned by him in his official reports. Under the Russian title "Zapiska grafy Joanna Capodistrias" is published in the series of the Imperial Russian Historical Society, vol. iii. p. 163 (St. Petersburg, 1868) the A perga da ma carriere pubblicata, written by Capo d'Istria and presented by the emperor Alexander, and dated at Geneva 15th December 1826. Unpublished materials may be mentioned the letters of Capo d'Istria to Sir Richard Church, vol. xvi. of the Church Papers in the British Museum (Add. MSS. 3653-3657). See further bibliography to chapter vi. of vol. x. of the Cambridge Modern History (1907). (W. A. P.)

CAPODISTRIA, a town and seaport of Austria, in Istria, 15 m. S.W. of Trieste by rail. Pop. (1900) 16,711, mostly Italians. It is situated on a small island, which occupies the end of a large bay in the Gulf of Trieste, and which is connected with the mainland by a causeway half a mile in length. Capodistria is an old town with small streets, and has preserved remarkably well its Italian, almost its Venetian character. The most noteworthy buildings are the cathedral, the town-hall and the Loggia or the old law-court, all situated in the principal square. In addition to the extraction of salt from the sea in the extensive salt works near the town, fishing and shipbuilding are the other principal occupations of the population. Trade is chiefly in sea-salt, wine and oil. Capodistria is usually identified with the town of Aegida, mentioned by Pliny, which appears by an inscription to have afterwards received (in the 6th century) the name of Justinopolis from Justin II. When at the beginning of the 13th century Istria fell into the hands of the patriarchs of Aquileia, they made this town the capital of the whole province. Thence it acquired its actual name, which means the capital of Istria. It is mentioned in the charters of the Venetians in 1279, and passed into Austrian possession in 1797.

CAPONIER (from the Fr. caponnière, properly a capon-cote or house), in fortification, a work constructed in the ditch of a fort. Its fire (musketry, machine-guns, case-shot, &c.) sweeps the bottom of the ditch and prevents an enemy from establishing himself in it. The term is used in a military sense as early as in the late 17th century. In various bastioned systems of fortification a caponier served merely as a covered means of access to outworks, the bastion trace providing for the defence of the ditch by fire from the main parapet.

CAPPADOCIA, in ancient geography, an extensive inland district of Asia Minor. In the time of Herodotus the Cappadocians occupied the whole region from Mount Taurus to the Euxine. That author tells us that the name of the Cappadocians (Katpatouka) was applied to them by the Persians, while they were termed by the Greeks "Syrians," or "White Syrians" (Lew cosmetics). Under the later kings of the Persian empire the
were divided into two satrapies or governments, the one comprising the central and inland portion, to which the name of Cappadocia continued to be applied by Greek geographers, while the other was called Cappadocia karak Phoros, or simply Pontus (g.n.). This division had already come about before the time of Xenophon. As after the fall of the Persian government the two provinces continued to be separate, the distinction was perpetuated, and the name Cappadocia came to be restricted to the inland province (sometimes called Great Cappadocia), which alone will be considered in the present article.

Cappadocia, in this sense, was bounded S. by the chain of Mount Taurus, E. by the Euphrates, N. by Pontus, and W. vaguely by the great central salt "Desert" (Axylon). But it is impossible to define its limits with accuracy. Strabo, the only ancient author who gives any circumstantial account of the country, greatly exaggerated its dimensions; it was in reality about 250 m. in length by less than 150 in breadth. With the exception of a narrow strip of the district called Melitene, on the east, which forms part of the valley of the Euphrates, the whole of this region is a high upland tract, attaining to more than 3000 ft., and constituting the most elevated portion of the great tablelands of Asia Minor (q.v.). The western parts of the province, where it adjoins Lycaonia, extending thence to the foot of Mount Taurus, are open treeless plains, affording pasture in modern times to numerous flocks of sheep, but almost wholly desolate. But out of the midst of this great upland level rise detached groups or masses of mountains, mostly of volcanic origin, of which the loftiest is Mount Argaesus (still called by the Turks Erjish Dagh), (13,100 ft.), and Hassan Dagh to the south-west (8000 ft.).

The eastern portion of the province is of a more varied and broken character, being traversed by the mountain system called by the Greeks Anti-Taurus. Between these mountains and the southern chain of Taurus, properly so called, lies the region called in ancient times Cataonia, occupying an upland plain surrounded by mountains. This district in the time of Strabo formed a portion of Cappadocia and was completely assimilated; but earlier writers and the Persian military system regarded the Cataonians as a distinct people.

Cappadocia contained the sources of the Sarus and Pyramus rivers with their higher affluents, and also the middle course of the Halys (see ASIA MINOR), and the whole course of the tributary of Euphrates now called Tokhma Su. But as no one of these rivers was navigable or served to fertilize the lands along its torrential course, none has much importance in the history of the province.

The kingdom of Cappadocia, which was still in existence in the time of Strabo, as a nominally independent state, was divided, according to that geographer, into ten districts. Of these Cataonia has been described; the adjoining district of Melitene, which did not originally form part of Cappadocia at all, but was annexed to it by Ariarathes I., was a fertile tract adjoining the Euphrates; its chief town retains the name of Malatia. Cilicia was the name given to the district in which Caesarea, the capital of the whole country was situated, and in which rose the conspicuous Mount Argaesus. Tyrnitis, the region of which Tyana and its most celebrated consecrated place in the extreme south, extending to the foot of Mount Taurus. Garosuritis appears to have comprised the western or south-western districts adjoining Lycaonia; its chief town was Archelais. Laviansene or Laviniene was the country south and south-east of Sivas, through which ran the road from Sebastea to Caesarea: Sargarausene lay south of the above, and included Uzun Yaila and the upper basin of the Tokhma Su; Saravene lay west of Laviansene and included the modern district of Ak Dagh; Chomanene lay west again of the above along the middle course of the Halys: Morimene was the north-western district extending along the edge of the central desert as far south as Melegob.

The only two cities of Cappadocia considered by Strabo to deserve that appellation were Mazaca, the capital of the kingdom under its native monarchs (see CAESAREA-MAZACA); and Tyana, not far from the foot of the Taurus, the site of which is marked by a great mound at a place called Kiz (or Ekriz) Hissar, about 12 m. south-west of Nigdeh. Archelaus, founded by Archelaus, the last king of the country, subsequently became a Roman colony, and a place of some importance. It is now Aksera.

Several localities in the Cappadocian country were the sites of famous temples. Among these the most celebrated were those of Comana (q.v.) and Venasa in Morimene, where a male god was served by over 3000 hierodoli. The local sanctity of Venasa has been perpetuated by the Moslem veneration for Hajj Bektash, the founder of the order of dervishes to which the Janissaries used in great part to belong. Cappadocia was remarkable for the number of its slaves, which constituted the principal wealth of its monarchs. Large numbers were sent to Rome but did not enjoy a good reputation. The Cappadocian peasants are still in the habit of taking service in the west of the peninsula and only returning to their homes after long absences; their labour is now much valued by employers, as they are a strong and fertile province. The province was celebrated for its horses, as well as for its vast flocks of sheep; but from its elevation above the sea, and the coldness of its climate, it could never have been rich and fertile.

History.—Nothing is known of the history of Cappadocia before it became subject to the Persian empire, except that the country was the home of a great "Hittite" power centred at Boghaz-Keui (see PTERIA), which has left monuments at many places, e.g. Nevsehir, Fraktin, Gorun, Malatia, various points about Alibistan and Derendeh, Bulgar Maden, Avandal and Tyana. Possibly the princes of the last named city were independent. With the decline of the Syro-Cappadocians after their defeat by Croesus, Cappadocia was left in the power of a sort of feudal aristocracy, dwelling in strong castles and keeping the peasants in a servile condition, which later made them apt for foreign slavery. It was included in the third Persian satrapy in the division established by Darius, but long continued to be governed by rulers of its own, none apparently supreme over the whole country and all more or less tributary to the Great King. Thoroughly subdued at last by the satrap Datames, Cappadocia recovered independence under a single ruler, Ariarathes (hence called Ariarathes I.), who was a contemporary of Alexander the Great, and maintained himself on the throne of Cappadocia after the fall of the Persian monarchy.

The province was not visited by Alexander, who contented himself with the tributary acknowledgment of his sovereignty made by Ariarathes before the conqueror's departure from Asia Minor; and the continuity of the native dynasty was only interrupted for a short time after Alexander's death, when the kingdom fell, in the general partition of the empire, to Eumenes. His claims were made good in 322 by the regent Perdiccas, who crucified Ariarathes; but in the dissensions following Eumenes's death, the son of Ariarathes recovered his inheritance and left it to a line of successors, who mostly bore the name of the founder of the dynasty. Under the fourth of the name Cappadocia came into relations with Rome, first as a foe espousing the cause of Antiocchus the Great, then as an ally against Perseus of Macedon. The kings henceforward threw in their lot with the Republic as against the Seleucids, to whom they had been from the time of Alexander's death, and of whom Antiochus VII. marched with a Roman proconsul Crassus against Aristonicus, a claimant to the throne of Pergamum, and their forces were annihilated (130 B.C.).

The embroglio which followed his death ultimately led to interference by the rising power of Pontus and the intrigues and wars which ended in the failure of the dynasty. The Cappadocians, supported by Rome against Mithradates, elected a native lord, Ariobarzanes, to succeed (93 B.C.); but it was not till Rome had disposed at once of the Pontic and Armenian kings that his rule was established (63 B.C.). In the civil wars Cappadocia was now for Pompey, now for Caesar, now for Antony, now against him. The Ariobarzanes dynasty came to an end and a certain Archelaus reigned in its stead, by favour first of Antony, then of Octavian, and maintained tributary independence till A.D. 17, when the emperor Tiberius, on Archelaus's death in disgrace, reduced Cappadocia at last to a province. Vespasian in A.D. 70
JOINED ARMENIA MINOR TO IT AND MADE THE COMBINED PROVINCE A FRONTIER BULWARK. IT REMAINED, UNDER VARIOUS PROVINCIAL REDISTRIBUTIONS, A PART OF THE EMPIRE TILL LATE IN THE 11TH CENTURY, THOUGH OFTEN RAVAGED BY PERSIANS AND ARABS. BUT BEFORE IT PASSED INTO SELJUK HANDS (1074), AND FROM THEM ULTIMATELY TO THE OSMANIS, IT HAD ALREADY BECOME LARGELY ARMENIAN IN RELIGION AND SPEECH; AND WE FIND THE SOUTHEN PART REFERRED TO AS "HERMENIUM OR TERRA" BY CRUSADING CHRONICLERS. AT THIS DAY THE NORTH-EAST AND EAST PARTS OF THE PROVINCE ARE LARGELY INHABITED BY ARMENIANS. THE NATIVE KINGDOMS HAD DONE MUCH TO HELLENIZE CAPADOCIA, WHICH HAD PREVIOUSLY RECEIVED A STRONG IRANIAN COLOUR; BUT IT WAS LEFT TO CHRISTIANITY TO COMPLETE THEIR WORK. THOUGH PRE-HELLENICUS LGNAGES SURVIVED IN THE LOCAL CULTS AND HABITS, A PART OF THE PEOPLE HAS REMAINED MORE OR LESS HELLENIC TO THIS DAY, IN SPITE OF ITS ENVIRONMENT BY MOSLEMS, CONQUERORS AND CONVERTS. THE TRADITION OF ITS EARLY CHURCH, ILLUMINATED BY THE NAMES OF THE TWO GREGORIANES AND BASIL OF CAESAREA, HAS BEEN PERPETUATED BY THE SURVIVAL OF A NATIVE ORTHODOX ELEMENT THROUGH THE WEST AND NORTH-WEST OF THE PROVINCE; AND IN THE REMOTE VALLEYS OF THE GREEK SPEECH HAS NEVER WHOLLY DIED OUT. ITS USE HAS ONCE MORE BECOME GENERAL UNDER GREEK PROPAGANDIST INFLUENCE, AND THE CAPADOCIAN "GREEKS" ARE NOW A FLOURISHING COMMUNITY.

CAPPEL, a French family which produced some distinguished jurists and theologians in the 15th and 16th centuries. In 1401, Guillaume Cappel, as rector of the university of Paris, protected against a tithe which Innocent VIII. claimed from that body. His nephew, Jacques Cappel (d. 1541), the real founder of the family, was himself advocate-general at the parliament of Paris, and in a celebrated address delivered before the court in 1537, against the emperor Charles V., claimed for Francis I. the counties of Artois, Flanders and Charolais. He left nine children, of whom three became Protestants. The eldest, Jacques (1540-1580), surn. de Tilley, wrote several treatises on Jewish and Christian subjects; Louis (1534-1580), surn. de Moriamont, the fifth son, was a most ardent Protestant. In 1570 he presented a confession of faith to Charles IX. in the name of his co-religionists. He disputed at Sedan before the duke de Bouillon with the Jesuit, Jean Maldonat (1534-1538), and wrote in defence of Protestantism. The seventh son, Ange (1533-1623), seigneur du Latu, was secretary to Henry IV., and enjoyed the esteem of Sully. Among those who remained Catholic should be mentioned Guillaume, the translator of Machiavelli. The eldest son Jacques also left two sons, famous in the history of Protestantism: Jacques (1570-1624), pastor of the church founded by himself on his title of de Tilley and afterwards at Sedan, where he became professor of Hebrew, distinguished as historian, philologist and exegetical scholar; and Louis (see below).

CAPPEL, LOUIS (1585-1658), French Protestant divine and scholar, a Huguenot whose descent is traced above, was born at St Etier, near Sedan, in 1585. He studied theology at Sedan and Saumur; and at Oxford, where he spent two years. At the age of twenty-eight he accepted the chair of Hebrew at Saumur, and twenty years afterwards was appointed professor of theology. Amongst her fellow lecturers were Moses Amyraut and Joseph de la Place. As a Hebrew scholar he made a special study of the history of the Hebrew text, which led him to the conclusion that the vowel points and accents are not an original part of the Hebrew language, but were inserted by the Massoretes of Tiberias, not earlier than the 5th century A.D., and that the primitive Hebrew characters are those now known as the Samaritan, while the square characters are Aramaic and were substituted for the more ancient at the time of the captivity. These conclusions were hotly contested by Johannes Buxtorf, being in conflict with the views of his father, Johannes Buxtorf senior, notwithstanding the fact that Elias Leviata had already disputed the antiquity of the vowel points and that neither Jerome nor the Talmud shows any acquaintance with them. His second important work, "Critica Sacra," was distasteful from a theological point of view. He had completed it in 1634; but owing to the fierce opposition with which he had to contend, he was only able to print it at Paris in 1659, by aid of a son, who had turned Catholic. The various translations of the Old Testament text and the differences between the ancient versions and the Massoretic text convinced him that the idea of the integrity of the Hebrew text, as commonly held by Protestants, was untenable. This amounted to an attack on the verbal inspiration of Scripture. Bitter, however, as was the opposition to his views, it was not long before his results were accepted by scholars.

Cappel was also the author of "Annotaciones et Commentarii in Vetus Testamentum," "Chronologia Sacra," and other biblical works, as well as of several other treatises on Hebrew, among which are the "Arcaenum Punctationum revocationem" (1624) and the "Distributa de veris et antiquis Ebraeorum litteris" (1645). His Commentaries of Capellorum gens, giving an account of the family to which he belonged, was first published in Latin in 1649, and a new edition in 1652, who, at the age of eighteen, became professor of Hebrew at Saumur, but, on the revocation of the edict of Nantes, fled to England, where he died in 1722. See Herzog-Hauck, "Realencyclopädie."
Ferdinand, hated her bitterly, as an adventuress and interloper. In October 1587 both the grand duke and his wife died of colic within a couple of days of each other. At the time poison was suspected, but documentary evidence has proved the suspicion to be unfounded.

See S. Romanini, Lessioni di storia Veneta, vol. ii. (Florence, 1875); G. E. Saltini, Tragedie Medice domestiche (Florence, 1898).

CAPPERONNII, CLAUDE (1671-1744), French classical scholar, the son of a tanner, was born at Montdidier on the 1st of May 1671. He studied at Amiens and Paris, and took orders in the Church of Rome, but devoted himself almost entirely to classical studies. He declined a professorship in the university of Bâle, and was afterwards appointed (1722) to the Greek chair in the Collège de France. He published an edition of Quintilian (1725) and left behind him at his death an edition of the ancient Latin Rhetoricians, which was published in 1756. He furnished much material for Robert Estienne's Thesaurus Linguae Latinae. His nephew, Jean Capperonnier (1716-1775), his successor in the chair of Greek at the Collège de France, was also a distinguished scholar, and published valuable editions of classical authors—Caesar, Anacreon, Plautus, Sophocles.

CAPPONI, GINO, MARQUIS (1702-1786), Italian statesman and historian, was born in Florence, September 27th 1702. The Capponi family are one of the most illustrious Florentine houses, and are mentioned as early as 1250; it acquired great wealth as a mercantile and banking firm, and many of its members distinguished themselves in the service of the republic and the Medici (see CAPPONI, PIERO), and later in that of the house of Lorraine. Gino was the son of the Marquis Pier Roberto Capponi, a nobleman greatly attached to the reigning grand duke of Tuscany, Ferdinand III. When that prince was deposed by the French in 1709 the Capponi family followed him into exile at Vienna, where they remained until he exchanged his rights to the grand duchy for a German principality (1803). The Capponi then returned to Florence, and in 1811 Gino married the marchesa Giulia Riccardi. Although the family were very anti-French Gino was chosen with other notables to pay homage to Napoleon in Paris in 1813. On the fall of Napoleon Ferdinand returned to Tuscany (September 1814), but the restoration proved less reactionary than in any other part of Italy. Young Capponi was well received at court, but not being satisfied with the life of mere rank and fashion, he devoted himself to the study of the world and foreign travel. After sundry journeys in Italy he again visited Paris in 1818, and then went to England. He became deeply interested in English institutions, and carefully studied the constitution, the electoral system, university life, industrial organization, &c. At Edinburgh he met Francis Jeffrey, the editor of the Edinburgh Review, and conceived a desire to found a similar review in Italy. Besides knowing Jeffrey he made the acquaintance of many prominent statesmen and men of letters, including Lord John Russell, the duke of Bedford, Dugald Stewart, Ugo Foscolo, &c. This visit had a great effect in forming his character, and while it made him an ardent Anglist, he realized more and more the distressing conditions of his own country. He returned to Italy in 1820, and on reaching Florence he set to work to found a review on the lines of the Edinburgh, which should attract the best literary talent. This he achieved with the help of the Swiss G. F. Viesseux, and the result was the Antologia. He contributed largely to its columns, as well as to that of the Archivio Storico, another of Viesseux's ventures. Capponi began to take a more active interest in political and social questions, and when the Littoria of all parts of Italy. He had discussed the possibility of liberating Italy with Prince Charles Albert of Savoy-Carignano, to whom he had introduced the Milanese revolutionist Count Confalonieri (q.v.). But the collapse of the rising of 1821 and the imprisonment of Confalonieri made Capponi despair of achieving anything by revolution, and he devoted himself to the economic development of Tuscany and to study. At his beautiful villa of Varramansa he collected materials for a history of the Church; his work was interrupted by family troubles and by increasing blindness, but although by 1844 he had completely lost his sight he continued to work by means of amanuenses. In 1847 he again plunged into politics and discussed plans for an Italian alliance against Austria. When the grand duke Leopold II. decided in 1848 to grant his people a constitution, Capponi was a member of the commission to draw it up, and he eventually became prime minister. During his short tenure of office he conducted foreign affairs with great skill, and made every effort to save the Italian situation after the defeat of Charles Albert on the Mincio. In October 1848 he resigned; soon afterwards the grand duke fled, anarchy followed, and then in 1849 he returned, but with an escort of Austrian soldiery. The blind statesman thanked God that he could not see the hated white uniforms in Florence. He returned to his studies and commenced his great Storia della Repubblica di Firenze; but he followed political affairs with great interest, and helped to convince Lord John Russell, who stayed with him in 1859, of the hopelessness of the grand duke's position. On Leopold's second flight (27th of April 1859) a Tuscan assembly was summoned, and Capponi elected member of it. He voted for the grand duke's deposition and for the union of Tuscany with Piedmont. King Victor Emmanuel made him senator in 1860. His last years were devoted almost exclusively to his Fiorenza, which he published in 1875 and achieved an immense success. This was Capponi's swan song, for on the 3rd of February 1876 he died at the age of eighty-four.

Capponi was one of the best specimens of the Tuscan landlord class. "He represents," wrote his biographer Tabarrini, "one of the most striking personalities of a generation, now wholly passed away, which did not resign itself to the beauteities of 1815, but wished to raise Italy from the humble state to which the European peace of that year had condemned her; and he succeeded by first raising the character of the Italians in the opinion of foreigners, so as to deserve their esteem and respect." He knew nearly all the most interesting people in Italy, besides many distinguished foreigners: Giuseppe Giusti, the poet, A. Manzoni, the novelist, Niccolò Tommaseo, Richard Cobden, A. von Reumont, the historian, among those whom he entertained at his palace or his villas, and many were the struggling students and revolutionists to whom he gave assistance. As a historian his reputation rests on his Storia della Repubblica di Firenze (Florence, 1875); it was the first comprehensive Italian book on the subject based on documents in a modern critical spirit, and if the chapters on the early history of the city are now obsolete in view of recent discoveries, yet, as a whole, it remains a standard work. Besides his history a large number of essays and pamphlets have been published in his Scritti Inediti.

See M. Tabarrini, Gino Capponi (Florence, 1879) and A. von Reumont, Gino Capponi (Gotha, 1880).

CAPPONI, PIERO (1447-1496), Florentine statesman and warrior. He was at first intended for a business career, but Lorenzo de' Medici, appreciating his ability, sent him as ambassador to various courts, where he acquitted himself with distinction. On the death of Lorenzo (1492), who was succeeded by his son, the weak and incapable Piero, Capponi became one of the leaders of the anti-Medicean faction which two years later expelled him from Florence. Capponi was then made chief of the republic and conducted public affairs with great skill, notably in the difficult negotiations with Charles VIII. of France, who had invaded Italy in 1494 and in whose camp the exiled Medici had then been taken. When Charles set out for Naples, entered Florence with his army and immediately began to behave as though he were the conqueror of the city, because he had entered it lance in rest. The signory was anxious to be on good terms with him, but when he spoke in favour of the Medici their temper changed at once, and the citizens were ordered to arm and be prepared for all emergencies. Tumults broke out between French soldiers and Florentine citizens, barricades were erected and stones began to fly from the windows. This alarmed Charles, who lowered his tone and said nothing more.
The intervening depression, which seems to be bounded on the
west by a fault, is filled to a large extent by sandstones and
marls of Eocene age. A superficial layer of recent volcanic
lava occurs in several parts of the island. The Blue Grotto is in
the Tithonian limestones; it shows indications of recent changes of
level.

The earliest mythical inhabitants (though some have localized
the Sirens here) are the Telebi from Acarnania under their king
Telen. Neolithic remains were found in 1882 in the Grotta delle
Felic, a cave on the south coast. In historical times we find the
island occupied by Greeks. It subsequently fell into the hands
of Neapolis, and remained so until the time of Augustus, who took
it in exchange for Aenaria (Ischia) and often resided there.
Tiberius, who spent the last ten years of his life at Capri, built
no fewer than twelve villas there; to these the great majority of
the numerous and considerable ancient remains on the island
belong. All these villas can be identified with more or less certainty,
the preserved being those on the east extremity, consisting of
a large number of vaulted substructures and the foundations
perhaps of a pharos (lighthouse). One was known as Villa Jovis,
and the other eleven were probably named after other deities.
The existence of numerous ancient cisterns shows that in Roman
times rain-water was largely used for lack of springs.

After Tiberius's death the island seems to have been little
visited by the emperors, and we hear of it only as a place of
banishment for the wife and sister of Commodus. The island,
having been at first the property of Neapolis, and later of the
emperors, never had upon it any community with civic rights.
Even in imperial times Greek was largely spoken there, for about
as many Greek as Latin inscriptions have been found. The
medieval town was on the north side at the chief landing-place
(Marina Grande), and to it belonged the church of S. Costanzo,
an early Christian building. It was abandoned in the 15th century
on account of the inroads of pirates, and the inhabitants took
refuge higher up at the two towns of Capri and Anacapri.

In 1866 the island was taken by the English fleet under Sir
Sidney Smith, and strongly fortified, but in 1858 it was retaken
by the French under Lamargue. In 1873 it was restored to
Ferdinand I. of the Two Sicilies.

bauten auf Capri (Leipzig, 1900).

CAPRICORN, or Caprèse (Ital. for a sudden motion or fancy),
a musical term for a lively composition of an original and fantastic
nature, not following a set musical form, although the
first known, written for the harpsichord, partook of the
nature of a fugue. The word is also used for pieces of a fanciful
type, in the nature of transcriptions and variations.

CAPRIOLE, or Capriole (Ital. for a sudden motion or fancy),
a musical term for a lively composition of an original and fantastic
nature, not following a set musical form, although the
first known, written for the harpsichord, partook of the
nature of a fugue. The word is also used for pieces of a fanciful
type, in the nature of transcriptions and variations.

CAPRIFOLIACEAE, a natural order of plants belonging to
the sympetalous or higher division of Dictyotales, that namely
which is characterized by having the petals of the flower united.
The plants are usually shrubs and trees; British representatives
are Sambucus (elder), Viburnum (guelder-rose and wayfaring tree),
Lonicera (honeysuckle) (see fig.); Adoxa (moschatel), a small herb with a creeping stem and small yellowish-green flowers, is
occasionally found on damp hedges-banks; Linnaea, a slender
creeper evergreen with a thread-like stem and pink bell-shaped
CAPRIVI DE CAPRERA DE MONTECUCCOLI

flower, a northern plant, occurs in fir-forests and plantations in
the north of England and Scotland. The leaves are opposite,
simple as in honeysuckle, or compound as in elder; they have
usually no stipules. The flowers are regular as in *Viburnum*

and *Sambucus*, more rarely two-lipped as in *Lonicera*; the sepal
and petals are usually five in number and placed above the ovary,
the five stamens are attached to the corolla-tube, there are three
to five carpels, and the fruit is a berry as in honeysuckle or
snowberry (*Symphoricarpos*), or a stone fruit, with several,
usually three, stones, as in *Sambucus*.

In *Sambucus* and *Viburnum* the small white flowers are
massed in heads; honey is secreted at the base of the styles
and, the tube of the flower being very short, is exposed to the
visits of flies and insects with short probosces. The flowers of
*Lonicera*, which have a long tube, open in the evening, when they
are sweet-scented and are visited by hawk-moths. The order
contains about 250 species, chiefly natives of the north temperate
zone and the mountains of the tropics. Several genera afford
ornamental plants; such are *Lonicera*, erect shrubs or twiners
with long-tubed white, yellow or red flowers; *Symphoricarpos*,
a North American shrub, with small whitish pendulous flowers
and white berries; *Diervilia* (also known as *Weigelia*), and
*Viburnum*, including *V. Opulus*, guelder rose, in the cultivated
forms of which the corolla has become enlarged at the expense of
the essential organs and the flowers are neuter.

CAPRIVI DE CAPRERA DE MONTECUCCOLI, GEORG LEO
VON, COUNT (1831-1899), German soldier and statesman, was
born on the 24th of February 1831 at Charlottenburg. The
family springs from Carniola, and the name was originally
written Kopriva; in the 18th century one branch settled in
Wernigerode, and several members entered the Prussian service;
the father of the chancellor held a high judicial post, and was
made a life member of the Prussian House of Lords. Caprivi
was educated in Berlin, and entered the army in 1849; he took
part in the campaign of 1866, being attached to the staff of the
1st army. In 1870 he served as chief of the staff to the 10th army
corps, which formed part of the 2nd army, and took part in the
battles before Metz as well as in those round Orleans, in which
he highly distinguished himself. One of the most delicate
strategical problems of the whole war was the question of
whether to change the direction of the 10th corps on the morning
of the 16th of August before Vionville, and in this, as well as in the
actual manœuvres of the corps on that day, Caprivi, as represent-
going of, and counsellor to, his chief, General v. Voigt-Rhetz,
took a leading part. At the battle of Beaune-la-Rolande,
the turning-point of the Orleans campaign, the 10th corps bore
the brunt of the fighting. After the peace he held several
important military offices, and in 1883 was made chief of the
admiralty, in which post he had to command the fleet and to
organize and represent the department in the Reichstag. He
resigned in 1888, when the command was separated from the
representation in parliament, and was appointed commander of
the 10th army corps. Bismarck had already referred to him as
a possible successor to himself, for Caprivi had shown great
administrative ability, and was unconnected with any political
party; and in March 1890 he was appointed chancellor, Prussian
minister president and foreign minister. He was quite unknown
to the public, and the choice caused some surprise, but it was
fully justified. The chief events of his administration, which
lasted for four years, are narrated elsewhere, in the article on
Germany. He showed great ability in quickly mastering the
business, with which he was hitherto quite unacquainted, as he
himself acknowledged; his speeches in the Reichstag were
admirably clear, dignified and to the point. His first achieve-
ment was the conclusion in July 1890 of a general agreement with
Great Britain regarding the sphere of influence of the two
countries in Africa. Bismarck had supported the colonial
parties in Germany in pretensions to which it was impossible
for Great Britain to give her consent, and the relations between
the two powers were in consequence somewhat strained. Caprivi
adopted a conciliatory attitude, and succeeded in negotiating
terms with Lord Salisbury which gave to Germany all she could
reasonably expect. But the abandonment of an aggressive
policy in East Africa and in Nigeria, and in the withdrawal of
German claims to Zanzibar (in exchange for Heligoland) aroused
the hostility of the colonial parties, who bitterly attacked the
new chancellor. Caprivi had, however, by making the frontiers
of the Congo Free State and German East Africa meet, "cut"
the Cape to Cairo connexion of the British, an achievement
which caused much dismay in British colonial circles, regular
treaties having been obtained from native chiefs over large
areas which the chancellor secured for Germany. In Nigeria
also Caprivi by the 1890 agreement, and by another concluded
as a 1893, made an excellent bargain for his country, while in
South Africa he could count on the consent of France eastward
to the Zambesi of the German protectorate (this strip of
territory being known as "Caprivi's Finger "). In his African
policy the chancellor proved far-sighted, and gained for the new
protectorates a period for internal development and consolidia-
tion. The Anglo-German agreement of 1890 was followed by
commercial treaties with Austria, Rumania, &c.; by conclud-
ing them he earned the express commendation of the emperor
and the title of count, but he was from this time relentlessly attacked
by the Agrarians, who made it a ground for their distrust that
he was not himself a landed proprietor; and from this time he
had to depend much on the support of the Liberals and other
parties who had been formerly in opposition. The reorganization
of the army caused a parliamentary crisis, but he carried it
through successfully, only, however, to earn the enmity of the
more old-fashioned soldiers, who would not forgive him for
shortening the period of service. His position was seriously
compromised by the failure in 1892 to carry an education bill
which he had defended by saying that the question at issue was
Christianity or Atheism, and he resigned the presidency of the
Prussian states, to Germany, which was then given to General
Eulenburg. In 1894, a difference arose between Eulenburg and Caprivi
concerning the bill for an amendment of the criminal code (the
Umsatz Verlage), and in October the emperor dismissed both.
Caprivi's fall was probably the work of the Agrarians, but it was
also due to the fact that, while he showed very high ability in
conducting the business of the country, he made no attempt to
secure his personal position by forming a party either in parlia-
ment or at court. He interpreted his position rather as a soldier;
he did his duty, but did not think of defending himself. He
CAPRONNIER—CAPSTAN

suffered much from the attacks made on him by the followers of Bismarck, and he was closely associated with the social ostracism of that statesman; we do not know, however, in regard either to this or to the other events of his administration, to what extent Caprivi was really the author of the policy he carried out, and to what extent he was obeying the orders of the emperor. With a loyalty which cannot be too highly praised, he always refused, even after his abrupt dismissal, to justify himself, and he could not be persuaded even to write memoirs for later publication.

The last years of his life were spent in absolute retirement, for he could not return even to the military duties which he had left with great reluctance at the orders of the emperor. He died unmarried on the 6th of February 1899, at the age of sixty-eight.

See R. Arndt, Die Reden des Grafen v. Caprivi (Berlin, 1894), with a biography.

CAPRONNIER, JEAN BAPTISTE (1814–1891), Belgian stained-glass painter, was born in Brussels in 1814, and died there in 1891. He had much to do with the modern revival of glass-painting, and first made his reputation by his study of the old methods of workmanship, and his clever restorations of old examples, and copies made for the Brussels archaeological museum. He carried out windows for various churches in Brussels and Bruges (1841–1852), and was later commissioned also for France, Italy and England. At the Paris Exhibition of 1855 he won the only medal given for glass-painting.

CAPSICUM, a genus of plants, the fruits of which are used as peppers (see CAYENNE PEPPER for botany, &c.). As used in medicine, the ripe fruit of the capsicum minium (or frutescans), containing the active principle capsaicin (capsacin), first isolated by Thresh in 1876, has remarkable physiological properties. Applied locally to the skin or mucous membrane, it causes redness and later vesication. Internally in small doses it stimulates gastric secretion and causes dilatation of the vessels; but if used internally in excess for a long period it will cause subacute gastritis. In single doses in excess it causes renal irritation and inflammation and strangury. The administration of capsicum is valuable in atony of the stomach due to chronic alcoholism, its hot stimulating effect not only increasing the appetite but to a certain degree satisfying the craving for alcohol. It is also useful in the flatulency of the aged, where it prevents the development of gas, and has a marked anorexigenic effect in anorexia. It has been used in functional torpidity of the kidney. Externally capsicum plaster placed over the affected muscles is useful in rheumatism and lumbago. Capsicum wool, known as curaric wool, made by dissolving the oleoresin of capsicum in ether and pouring it on to absorbent cotton-wool, is useful in rheumatic affections.

CAPSTAN (also spell in other forms, or as "capstock" and "cable stock," connected with the O. Fr. capet or capestion, from Lat. capistrum, a halter, capere, to take hold of; the conjecture that it came from the Span. cebao, goat, and estando, standing, is untenable), an appliance used on board ship and on dock walls, for heaving-in or heaving and hauling, whether of iron, steel or hemp. It differs from a windlass, which is used for the same purposes, in having the axis on which the rope is wound vertical instead of horizontal. The word seems to have come into English (14th century) from Fr. or Spanish shipmen at the time of the Crusades. The earlier forms were of a comparatively simple character, made of wood with an iron spindle and worm, or manual labour with wooden capstan bars. As heavier cables were supplied to ships, difficulty was found, when riding at anchor, in holding, checking and heaving cable. A capstan (W. H. Harfield's) was tested in H.M.S. "Newcastle" (wooden frigate) in 1870 and proved effective; its first development in 1876 was the application in the form of a windlass secured to the deck, driven by a messenger chain from the capstan, fitted in H.M.S. "Inflexible" (fig. 1).

The capstans and engine are shown at A, A, A, and the windlass B driven by messenger chains C, C. The four cables (dotted line D, D) lead to their respective cable-holders, fitted with a brake, and by these means each cable-holder can be connected to the main driving shaft, and any cable heave-in or veered independently of the other; by using steam power instead of manual, the previous slow motion was obviated. In H.M.S. "Collingwood" steam power was used to work the windlass directly by means of worm gearing; the windlass was divided into two parts, so that the one on the port side could be worked independently of that on the starboard, and vice versa. An independent capstan in both ships, arranged to take either of the cables, could be worked by hand or steam. In the "Collingwood's" windlass the cables remained on their holders, and could be heave-in or veered without being touched.

Napier's patent windlass for merchant ships (1906) resembles an appliance fitted in the earlier second-class cruisers of the British navy (1890 to 1900). Two cable-wheel or cable-holders are mounted loose on a horizontal axle, one on each side of a worm wheel which is tightly keyed on the middle part of the axle. A vertical steam engine with two cylinders, placed one on each side of the framing, drives a second horizontal axle which is connected by a set of bevel gears to an upright worm shaft, which works the worm wheel. This worm wheel can be connected by means of sliding bolts to one or both of the cable wheels, enabling one or both cables to be heave-in or veered as necessary. A brake, of Napier's self-holding differential type, is fitted to each cable wheel, and is controlled by hand wheels on the aft side of the windlass. For warping purposes, warping drums are fitted (made portable if required). A third central capstan, fitted forward of the windlass, is connected to the upright worm shaft by a horizontal shaft and bevel wheels. It can also be worked by manual labour with capstan bars. Fig. 2 represents the arrangement of the capstans on the forecastle of a battleship, fitted by Napier Brothers. Deep-bodied capstans have been superseded by low drum-headed ones, over which the guns may be fired. The three capstans or cable-holders of cast steel, capable of taking 2½ in. cables, are fitted on vertical spindles, which pass down through the main and armoured decks to the platform one, where the steam engine and gearing are placed. The gearing consists of worm and wheel gears, so arranged that the three capstans can be worked singly or in conjunction, when heaving-in or veering, and the brakes (of the type previously mentioned) are controlled by a portable hand wheel fitted on the aft side of each. The cable-holders can be used for riding at anchor (see CABLE). The middle line capstan E is keyed to vertical spindles and can be coupled up to the capstan engine, by clutch and drop bolts in the capstan engine room; it is fitted with a cable-holder, to take either the port or starboard cables, and in addition is provided with portable whels, enabling it to be used for warping. It can also be worked by manual labour with capstan bars, a drum head E', fitted on the spindle on the main deck, enabling additional capstan bars to be used if required.

To avoid carrying steam pipes aft, the after capstan is worked...
by an electric motor which is kept below the water-line. Napier Brothers' capstan (fig. 3) is for warping purposes, for working the stern anchor with wire hawser and for coaling. It is placed on the upper deck, and is fitted with a drum-head for capstan bars, with pawls and pawl rim on the deck plate, the pawls A being lifted and placed on their rests B when working with the motor. The upper portion of the capstan, together with its drum-head, is portable, being fixed to the centre boss with keys and gun-metal screws. The centre boss is keyed to the spindle, which passes through the deck and carries at its lower end a coupling for connecting to the worm wheel gear. For working by motor, the additional security of two drop bolts is provided. The gearing consists of a single worm and worm wheel, working in an oil-bath, the worm shaft being coupled direct to the motor spindle. The motor is of the semi-enclosed type, the working and live parts being protected by a perforated metallic covering; it is worked off a 100 volt circuit, at a speed under full load conditions of 300 revolutions per minute. The motor is of a 4pole type and compound wound, the shunt winding limiting the speed on light and the motor 9000 revolutions per minute. A frictional break is provided, pulled off by means of a shunt-excited magnet. The controller is of the reversing drum type, with not less than four steps in either direction, and is fitted with a magnetic blow-out. The control is effected by a removable hand wheel on a portable pedestal, fitted on top with a circular dial plate and indicating pointer; the hand wheel reverses the current as well as graduates the speed in either direction. All capstans of the British navy, after being fitted on board ship, are tested for lifting power and speed; with foremost (steam) capstans, the steam being at 150 lb pressure, the anchor is usually let go in 10 to 25 fathoms water, and the speed ascertained by observing the time taken to heave-in not less than a length of cable, 75 ft.; the length must be heave-in in three minutes, or at the rate of 25 ft. per minute. With the after capstan (motor) of first-class battleships and cruisers, a weight is used instead of an anchor, the test being to lift 9 tons at the rate of 25 ft. per minute. Capstans on dock walls in British government docks yards are usually driven by hydraulic or air pressure, conveyed through pipes to small engines underneath the capstans. (J. W. D.)

CAPSULE (from the Lat. capsula, a small box), a term in botany for a dry seed vessel, as in the poppy, iris, foxglove, &c., containing one or more cells. When ripe the capsule opens and scatters the seed (see Botany). The word is used also for a small gelatinous case enclosing a dose of medicine, and for a metal cap or cover on bottles and jars. In anatomy the term is used to denote a cover or envelope partly or wholly surrounding a structure. Every diarthrodial joint possesses a fibrous or ligamentous capsule, lined with synovial membrane, attached to the adjacent ends of the articulating bones. The term is particularly applied to the sac which envelopes the crystalline lens of the eye; to Glisson's capsule, a thin areolar coat of fibrous tissue lying inside the tunica serosa of the liver; to the glomerular capsules, two small flattened organs in the epigastric region; and to the internal and external capsules of the brain (see Brain, fig. 14 and explanation).

CAPTAIN (derived from Lat. caput, head, through the Low Lat. captianus), a chief or leader, in various connections, but particularly a grade officer in the army or navy.

At sea the name of captain is given to all who command ships whether they belong to the military navy of their country or not, or whether they hold the substantive rank or not. Thus a lieutenant when in command of a vessel is addressed as captain. In France a naval lieutenant is addressed as mon capitaine, because he has that comparative rank in the army. The master of a merchant ship is known as her captain. But the name is also used in the strict sense of foreman, or head man, to describe many of the minor or “ petty ” officers of a British or American man-of-war—the captain of a top, of the forecastle, or of a gun. The title “ post captain ” in the British navy means simply full captain, and is the equivalent of the French capitaine de vaisseau. It had its origin in the fact that captains appointed to a ship of twenty guns and upwards were included in, or “posted” on, the permanent list of captains from among whom the admirals were chosen. The captain of the fleet is an officer who acts as chief of the staff to an admiral commanding a large force. The position is equivalent to flag rank, but is held by a captain. Captain is the highest grade of the officers entrusted with the navigation of a ship or fleet.

The military rank of captain (Fr. capitaine, Ger. Hauptmann, or in the cavalry, Rittmeister), which was formerly the title of an officer of high rank corresponding to the modern general officer or colonel, has with the gradual subdivision and articulation of rank gone to not only applied to the commanders of companies or squadrons, and in general to officers of the grade equivalent to this command (see Officers).

The title of “ captain-general ” was formerly used in the general sense of a military commander-in-chief, and is still similarly used in Spain. In the Spanish army there are eight captains-general, each of whom has command of a “ region ” corresponding to an army corps district. The same title was formerly given to the Spanish governors of the colonial provinces in the New World. The official title of the governor of Jamaica is “ captain-general and governor-in-chief.”

CAPTAL (Lat. capitalis, “ first,” “ chief”), a medieval feudal title in Gascony. According to Du Cange the designation capitd (capit, capitau, capitau) was applied loosely to the more illustrious nobles of Aquitaine, counts, viscounts, &c., probably as capitales domini, “ principal lords,” though he quotes more fanciful explanations. As an actual title the word was used only by the lords of Trene, Puychagut, Epernon and Buch. It is best known in connexion with the famous soldier, Jean de Grailly, capitd of Bush (d. 1576), the “ capitd de Buch ” par excellence, immortalized by Massillon as the companion of the Black Prince and the champion of the English cause against France. His active part in the war began in 1364, when he ravaged the country between Paris and Rouen, but was beaten by Bertrand du Guesclin at Cocherel and taken prisoner. Released next year, he received the seigniory of Nemours and took the oath of fealty to the French king, Charles V., but soon resumed his new fief and returned to his allegiance to the English king. In 1356 he took part in the battle of Navarette, in which Du Guesclin was taken prisoner, the capitd being entrusted with his safe-keeping. In 1371 Jean de Grailly was appointed constable of Aquitaine, but was taken prisoner next year and interned in the Temple at Paris where, resisting all the tempting offers of the French king, he remained till his death five years later.

CAPTION (Lat. capere, a taking or catching), a term still used in law, especially Scots, for arrest or apprehension. From the obsolete sense of a catching at any possible plea or objection there has arisen the adjective “ captious,” i.e. sophistical or fault-finding. The term has also an old legal use, to signify the part of an indictment, &c., which shows where, when and by what authority it is taken, found or executed; so its opening or heading. From this is derived the modern sense of the heading of an article in a book or newspaper.

CAPTIVE (from Lat. capere, to take), one who is captured in warfare. As a term of International Law, it has been displaced by that of “ prisoner of war.” The position and treatment of captives or prisoners of war is now dealt with fully in chapter ii. of the regulations annexed to the Hague Convention respecting the Laws and Customs of War on Land, of the 18th of October 1907. See Peace Conference and War; also Sir T. Barclay, supplement to Problems of International Practice and Diplomacy, for comparison of texts of 1899 and 1907.
CAPTURE (from Lat. capere, to take; Fr. prise maritime; Ger. Wehnsache), in international law, the taking possession by a belligerent vessel of an enemy or neutral merchant or non-fighting ship. If an enemy ship is captured she becomes forthwith lawful prize (q.v.); when a neutral ship, the belligerent commander, in case her papers are not conclusive, has a right to search her. If he finds contraband on board or the papers or cargo or circumstances excite any serious suspicion in his mind, which the master of the ship has been unable to dispel, he places an officer and a few of his crew on board and sends her to the nearest port where there is a prize court for trial. The word is also used for the vessel thus captured (see BLOCKADE, CONTRABAND).

CAPUA (anc. Casilinum), a town and archiepiscopal see of Campania, Italy, in the province of Caserta, 7 m. W. by rail from the town of Caserta. Pop. (1901) 14,285. It was erected in 856 by Bishop Landulf on the site of Casilinum (q.v.) after the destruction of the ancient Capua by the Saracens in 846, but it only occupies the site of the original pre-Roman town on the left (south) bank of the river.

The cathedral of S. Stefano, erected in 856, has a handsome atrium and a lofty Lombard campanile, and a (modernized) interior with three aisles; both it and the atrium have ancient granite columns. The Romanesque crypt, with ancient columns, has also been restored. It has a fine pascal candlestick, and the fragments of a pulpit with marble mosaic of the 13th century. There are also preserved in the cathedral a fine Exultet roll and an evangelarium of the end of the 12th century, bound in bronze decorated with gold filigree and enamels. The mosaics of the beginning of the 12th century in the apses of the cathedral and of S. Benedetto, were destroyed about 1270 and 1620 respectively. The small church of S. Marcello was also built in 856. In 1252–1240 Frederick II. erected a castle to guard the Roman bridge over the Volturno, composed of a triumphal arch with two towers. This was demolished in 1557. The statues with which it was decorated were contemporary imitations of classical sculptures. Some of them are still preserved in the Museo Campano (E. Bertaux, L'Art dans l'Italie méridionale, Paris, 1904, i. 707). The Museo Campano also contains a considerable collection of antiquities from the ancient Capua.

Capua changed hands frequently during the middle ages. One of the most memorable facts in its history is the terrible attack made on it in 1501 by Caesar Borgia, who had entered the town by treachery, in which 3000 lives were sacrificed. It remained a part of the kingdom of Naples until the 2nd of November 1860, when, a month after the battle of the Volturno, it surrendered to the Italian troops.

CAPUA (mod. S. Maria di Capua Vetere), the chief ancient city of Campania, and one of the most important towns of ancient Italy, situated 16 m. N. of Neapolis, on the N.E. edge of the Campanian plain. Its site in a position not naturally defensible, together with the regularity of its plan, indicates that it is not a very ancient town, though it very likely occupies the site, or a part of its site, of an early Etruscan settlement. Its foundation is attributed by Caesar to the Etruscans and the tradition given as about 260 years before it was "taken" by Rome (Vell. i. 7). If this be referred, not to its capture in the second Punic War (211 B.C.) but to its submission to Rome in 338 B.C., we get about 600 B.C. as the date of its foundation, a period at which the Etruscan power was at its highest, and which may perhaps, therefore, be accepted. The origin of the name is probably Campus, a plain, as the adjective Campanus shows, Capuanae being a later form stigmatized as incorrect by Varro (De L. x. 16). The derivation from καῦτας (a vulture, Latinized into Volturnium by some authorities who tell us that this was the original name), and that from Caput (as though the name had been given it as the "head" of the twelve Etruscan cities of Campania), must be rejected.

The Etruscan supremacy in Campania came to an end with the Samnite invasion in the latter half of the 4th century B.C. (see CAMPA; these conquerors, however, entered into alliance with Rome for protection against the Samnite mountain tribes, and with Capua came the dependent communities Casilinum, Calatia, Atella, so that the greater part of Campania now fell under Roman supremacy. The citizens received the civitas sine suffragio. In the second Samnite War they proved untrustworthy, so that the Ager Falernus on the right bank of the Volturnus was taken from them and distributed among citizens of Rome, the tribus Falerna being thus formed; and in 318 the powers of the native officials (medices) were limited by the appointment of officials with the title proiecti Capuan Cumas (taking their name from the most important towns of Campania); these were at first mere deputies of the praetor urbanus, but after 123 B.C. were elected Roman magistrates, four in number; they governed the whole of Campania until the time of Augustus, when they were abolished. In 312 B.C. Capua was connected with Rome by the construction of the Via Appia, the most important of the military highways of Italy. The gate by which it left the Servian walls of Rome, the Porta Capena, perhaps the only case in which a gate in this encinte bears the name of the place to which it led. At what time the Via Latina was prolonged to Casilinum is doubtful (it is quite possible that it was done when Capua fell under Roman supremacy, i.e. before the construction of the Via Appia); it afforded a route only 6 m. longer, and the difficulties in connexion with its construction were much less; it also avoided the troublesome journey through the Pomptine Marshes (see T. Ashby in Papers of the British School at Rome, i. 217, London, 1902). The importance of Capua increased steadily during the 3rd century, and at the beginning of the second Punic War it was considered to be only slightly behind Rome and Carthage themselves, and was able to furnish 30,000 infantry and 3000 cavalry. Until after the defeat of Cannae it remained faithful to Rome, but, after a vain demand that one of the consuls should always be selected from it, it transferred its allegiance to Hannibal, who made it his winter-quarters, with bad results to the morale of his troops (see Punic Wars). After a long siege it was taken by the Romans in 211 B.C. and severely punished; its magistrates and communal organizations were abolished, the inhabitants losing their civic rights, and its territory became Roman state domain. Parts of it were sold in 205 and 199 B.C., another part was divided among the citizens of the new colonies of Volturnum and Litterum established near the coast in 194 B.C., but the greater portion of it was reserved to be let by the state. Considerable difficulties occurred in preventing illegal encroachments by private persons, and it became necessary to buy a number of them out in 162 B.C. It was, after that period, let, not to large but to small proprietors.

Frequent attempts were made by the democratic leaders to divide the land among new settlers. Brutus in 83 B.C. actually succeeded in establishing a colony, but it was soon dissolved; and Cicero's speeches De Lege Agraria were directed against a project by Servilius Rullus in 63 B.C. In the meantime the need of an organized and self-supporting colonially populated district was in a measure supplied by grouping them round important shrines, especially that of Diana Tifatina, in connexion with which a pagus Dianoae existed, as we learn from many inscriptions; a pagus Herculanensis is also known. The town of Capua belonged to none of these organizations, and was entirely dependent on the prospect. It enjoyed great prosperity, however, owing to its spelt, which was worked into groats, wine, roses, spices, unguents, &c., and also owing to its manufactures, especially of bronze objects, of which both the elder Cato and the elder Pliny speak in the highest terms (De agr. 135; Hist. Nat. xxiv. 95). Its luxury remained proverbial; and Campania is especially spoken of as the home of gladiatorial combats. From the gladiatorial schools of Campania came Spartacus and his followers in 73 B.C. Julius Caesar as consul in 39 B.C. succeeded in carrying out the establishment of a colony in connexion with his agrarian law, and 20,000 Roman citizens were settled in this territory. The number of colonists was increased by Mark
Antony, Augustus (who constructed an aqueduct from the Mons Tifata, and gave the town of Capua estates in the district of Cnossus in Crete to the value of 12 million sesterces—£120,000), and Nero. In the war of A.D. 69 it took the side of Vitellius. Under the later empire it is not often mentioned; but in the 4th century it was the seat of the consularis Companioae and its chief town, though Ausonio puts it behind Mediolanum (Milan) and Aquileia in his ordo nobilium urbis. Under Constantine we hear of the foundation of a Christian church in Capua. In A.D. 456 it was taken and destroyed by Genseric, but must have been soon rebuilt: it was, however, finally destroyed by the Saracens in 840 and the church of S. Maria Maggiore, founded about 497, alone remained. It contains 52 ancient marble columns, but was modernized in 1766. The site was only occupied in the late middle ages by a village which has, however, outgrown the medieval Capua in modern days.

Remains.—No pre-Roman remains have been found within the town of Capua itself, but important cemeteries have been discovered on all sides of it, the earliest of which go back to the 7th or 6th century B.C. The tombs are of various forms, partly chambers with frescoes, partly cubic blocks of peperino covered with greenish, with grooved lids. The objects found within them consist mainly of vases of bronze (many of them without feet, and with incised designs of Etruscan style) and of clay, some of Greek, some of local manufacture, and of paintings.

On the east of the town, in the Pattrurelli property, a temple has been discovered with Osca votive inscriptions, some of them inscribed upon terra-cotta tablets, others on cippi, while of a group of 150 tufa statuettes (representing a matron holding one or more children in her lap) three bore Latin inscriptions of the early imperial period. The site of the town being in a perfectly flat plain, without natural defences, it was possible to lay it out regularly. Its length from east to west is approximately determined by the fact that the Via Appia, which runs from north-west to south-east from Casilinum to Calata, turns due east very soon after passing the so-called Arco Campano (a triumphal arch of good brickwork, once faced with marble, with three openings, erected in honour of some emperor unknown), and continues to run in this direction for 5413 English feet (about 1600 ancient Roman feet). The west gate was the Porta Romana; remains of the east gate (the name of which we do not know) have been found. This fact shows that the main street of the town was perfectly orientated, and that before the Via Appia was constructed, i.e. in all probability in pre-Roman times. The width of the town from north to south cannot be so accurately determined as the line of the north and south walls is not known, though it can be approximately fixed by the absence of tombs (Beloch fixes it at 4000 Osca feet = 3600 English feet), nor is it absolutely certain (though it is in the highest degree probable, for Cicero praises its regular arrangement and fine streets) that the plan of the town was rectangular. Within the town are remains of thermae on the north of the Via Appia and of a theatre opposite, on the south. The theatre consists of a large cryptoporticus round three sides of a court, the south side being open to the road; it now lies under the prison. Beloch (see below) attributes this to the Osca period; but the construction as shown in Labruzzi’s drawing (v. 18) is partly of brickwork and opus reticulatum, which may, of course, belong to a restoration.

The stage of the theatre had its back to the road; Labruzzi (v. 18) gives an interesting view of the cavea. It appears from inscriptions that it was erected after the time of Augustus. Other inscriptions, however, prove the existence of a theatre as early as 94 B.C., so that the existence of another elsewhere must be assumed. We know that the Roman colony was divided into regions and possessed a capitollum, with a temple, within the town, and that the market-place, for unguents especially, was called Sepulcia; we also hear of an aedes aedibus, probably the original senate house, which stood in an open space known as alaba. But the sites of all these are quite uncertain. Outside the town on the north is the amphitheatre, built in the time of Augustus, restored by Hadrian and dedicated by Antoninus Pius, as the inscription over the main entrance recorded. The exterior was formed by 80 Doric arcades of four storeys each, but only two arches now remain. The keystones were adorned with heads of divinities. The interior is better preserved; beneath the arena are subterranean passages like those in the amphitheatre at Puteoli. It is one of the largest in existence; the longer diameter is 185 yds., the shorter 152, and the arena measures 85 by 49 yds., the corresponding dimensions in the colosseum at Rome being 205, 170, 93 and 58 yds. To the east are considerable remains of baths—a large octagonal building, an apse against which the church of S. Maria della Grazie is built, and several heaps of débris. On the Via Appia, to the south-east of the east gate of the town, are two large and well-preserved tombs of the Roman period, known as le Carceri vecchie e la Conocchia. To the east of the amphitheatre is an ancient road, the Via Dianae, leads north to the Pagus Dianae, on the west slopes of the Mons Tifata, a community which sprang up round the famous and ancient temple of Diana, and probably received an independent organization after the abolition of that of Diana in 1766. The place of appearance was probably a base for attacks on the latter, and Sulla, after his defeat of C. Norbanus, gave the whole of the mountain to the temple. Within the territory of the pagus were several other temples with their magistri. After the restoration of the community of Capua, we find magistri of the temple of Diana still existing, but they were probably officials of Capua itself. The site is occupied by the Benedictine church of S. Angelo in Formis which dates from 944, and was reconstructed by the abbot Desiderius (afterwards Pope Victor III.) of Monte Cassino in 1773, with interesting paintings, dating from the end of the 11th century to the middle of the 12th, in which five different styles may be distinguished. They form a complete representation of all the chief episodes of the New Testament (see F. X. Kraus, Jahrbuch d. k. preuss. Kunstsammlungen, xiv.). Deposits of votive objects (fanissae), removed from the ancient temple from time to time as new ones came in and occupied all the available space, have been found, and considerable remains of buildings belonging to the Vicus Dianae (now standing on a triumphal arch and some baths, also a hall with frescoes, representing the goddess herself ready for the chase) still exist.

The ancient road from Capua went on beyond the Vicus Dianae to the Volturinus (remains of the bridge still exist) and then turned east along the river valley to Calatia and Telesia. Other roads ran to Puteoli and Cumae (the so-called Via Campana) and to Neapolis, and as we have seen the Via Appia passed through Capua, which was thus the most important road centre of Campania (q.v.).

**CAPUCHIN MONKEY**

The English name of a tropical American monkey scientifically known as Cebus capucinus; the plural, capuchins, is extended to embrace all the numerous species of the same genus, whose range extends from Nicaragua to Paraguay. These monkeys, whose native name is sapajou, are the typical representatives of the family Cebidae, and belong to a sub-family in which the tail is generally prehensile. From the other genera of that group (Cebinae) with prehensile tails capuchins are distinguished by the comparative shortness of that appendage, and the absence of a naked area on the under surface of its extremity. The hair is not woolly, the general build is rather stout, and the limbs are of moderate length and slenderness. The name capuchin is derived from the somewhat cowl-like form assumed by the thick hair on the crown of the head of the sapajous. In their native haunts these monkeys go about in troops of considerable size, frequenting the summits of the tall forest-trees, from which they seldom, if ever, descend. In addition to fruits of various kinds, they consume tender shoots and buds, insects, eggs and young birds. Many of the

1 For these drawings see T. Ashby, “Desins inédits de Carlo Labruzzi,” in Mélanges de l’Ecole française, 1903, 414.  
2 The name comes from the aqueduct (forma) erected by Augustus for the supply of Capua, remains of which still exist.
species are difficult to distinguish, and very little is known of their habits in their wild state, although several members of the group are common in captivity (see PRIMATES).

CAPUCHINS, an order of friars in the Roman Catholic Church, the chief and only permanent offshoot from the Franciscans. It arose about the year 1520, when Matteo di Bassi, an "Observer" Franciscan, became possessed of the idea that the habit worn by the Franciscans was not the one that St Francis had worn; accordingly he made himself a pointed or pyramidal hood and also allowed his beard to grow and went about bare-footed. His superior tried to suppress these innovations, but in 1528 he obtained the sanction of Clement VII. and also the permission to live as a hermit and to go about everywhere preaching to the poor; and these permissions were not only for himself, but for all such as might join him in the attempt to restore the most literal observance possible of St Francis's rule. Matteo was soon joined by others. The Observants opposed the movement, but the Conventuals supported it, and so Matteo and his companions were formed into a congregation, called the Hermit Friars Minor, as a branch of the Conventual Franciscans, but with a viceroy of their own, subject to the jurisdiction of the general of the Observants, and thus the name Capuchin was given to the new congregation. In 1529 they had four houses and held their first general chapter, at which their special rules were drawn up. The aim of the Capuchins was to live as one of extreme austerities, simplicity and poverty—in all things as near an approach to St Francis's idea as was practicable. Neither the monasteries nor the congregation should possess anything, nor were any devices to be resorted to for evading this law; no large provision against temporal wants should be made, and the supplies in the house should never exceed what was necessary for a few days. Everything was to be obtained by begging, and the friars were not allowed even to touch money. The community was to be small, eight being fixed as the normal number and twelve as the limit. In furniture and clothing extreme simplicity was enjoined and the friars were to go bare-footed without even sandals. Besides the choral canonical office, a portion of which was recited at midnight, there were two hours of private prayer daily. The fasts and disciplines were rigorous and frequent. The great external work, however, was done by the superiors, and was attended by a general for the poor. In theology the Capuchins abandoned the later Franciscan school of Scottus, and returned to the earlier school of Bonaventura (q.v.). The new congregation at the outset of its history underwent a series of severe blows. The two founders left it, Matteo di Bassi to return to the Observants, while his first companion, on being superseded in the office of vicar, became so insubordinate that he had to be expelled. The case of the third vicar, Bernardino Ochino (q.v.), who became a Calvinist, 1543, and married, was even more disastrous. This mishap brought the whole congregation under the suspicion of heretical tendencies and the pope resolved to suppress it; he was with difficulty induced to allow it to continue, but the Capuchins were forbidden to preach. In a couple of years the authorities were satisfied as to the soundness of the general body of Capuchin friars, and the permission to preach was restored. The congregation at once began to multiply with extraordinary rapidity, and by the end of the 16th century the Capuchins had spread all over the Catholic parts of Europe, so that in 1610 they were freed from their dependence upon the Conventual Franciscans and became an independent mendicant order of their own. They are said to have had at that time 1,500 houses divided into fifty provinces. They were one of the chief factors in the Catholic Counter-reformation, working assiduously among the poor, preaching, catechizing, confessing in all parts, and impressing the minds of the common people by the great poverty and austerity of their life. By these means they were also extraordinarily successful in making converts from Protestantism to Catholicism. Nor were the activities of the Capuchins confined to Europe. From an early date they undertook missions to the heathen in America, Asia and Africa, and at the middle of the 17th century a Capuchin missionary college was founded in Rome for the purpose of preparing their subjects for foreign missions. A large number of Capuchins have suffered martyrdom for the Gospel. This activity in Europe and elsewhere continued until the close of the 18th century, when the number of Capuchin friars was estimated at 31,000.

Like all other orders, the Capuchins suffered severely from the secularizations and revolutions of the end of the 18th century and the first half of the 19th; but they survived the strain, and during the latter part of the 19th century rapidly recovered ground. At the beginning of the present century there were fifty provinces with some 500 monasteries and 900 hospices or lesser houses; and the number of Capuchin friars, including lay-brothers, was reckoned at 93,000. In England there are ten or twelve Capuchin monasteries, and in Ireland three. The Capuchins now possess the church of the Portiuncula at Assisi. The Capuchins still keep up their missionary work and have some 200 missionary stations in all parts of the world—notably India, Abyssinia and the Turkish empire. Though "the poorest of all orders," it has attracted into its ranks an extraordinary number of the highest nobility and even of royalty. The celebrated Father Gonzalez, the apostle of Temperance in Ireland, was a Capuchin friar. Like the Franciscans the Capuchins wear a brown habit.

The Capuchins are Capuchin nuns. They were founded in 1538 in Naples. They lived according to the rules and regulations of the Capuchin friars, and so austere was the life that they were called "Sisters of Suffering." The order spread to France and Spain, and a few convents still exist.

In order fully to grasp the meaning of the Capuchin reform, it is necessary to know the outlines of Franciscan history (see FRANCISCANS). There does not appear to be any modern general history of the Capuchin order as a whole, though there are histories of various centuries and of the foreign missions. The references to all this literature will be found in the article "Kapuzinerorden" in Wetzel und Welte, Kirchenlexicon (2nd ed.), which is the best general sketch on the subject. Shorter sketches, with the needful references, are given in Max Heimbuch, Orden und Konventsgemeinschaften (1866), l. 44; and in Herzog-Hauck, Realencyclopaedie (3rd ed.), art. "Kapuziner.

Helyot's Hist. des ordres religieux (1792), vii. 24 and 27, gives an account of the Capuchins up to the end of the 17th century.

CAPUS, ALFRED (1838–1925), French author, was born at Aix, in Provence, on the 23rd of November 1838. In 1872 he published, in collaboration with L. Vonoven, a volume of short stories, and in the next year the two produced a one-act play, Le Mari malgré lui, at the Théâtre Cluny. He had been educated as an engineer, but became a journalist, and joined the staff of the Figaro in 1864. His novels, Qui perd gagne (1890), Faux Désir (1891), Années d'aventures (1895), which belong to this period, describe the struggles of three young men at the beginning of their career. From the first of these he took his first comedy, Brignol et sa fille (Vaucluse, 23rd November 1894). Among his later plays are Innocent (1896), written with Alphonse Allais; Petites folies (1897); Rosine (1897); Mariage bourgeois (1898); Les Mârs de Léontine (1900); La Bourse ou la vie (1900), La Yenne (1901); La Petite Fonctionnaire (1901); Les Deux Écoles (1902); La Châtelaine (1902); L'Adversaire (1903), with Emmanuel Arène, which was produced in London by Mr George Alexander as The Man of the Moment, and Notre Jeunesse (1904), the first of his plays to be represented at the Théâtre Français; Monseigneur Pilégeois (1905); and, in collaboration with Lucien Descaves, L'Attente (1906).

Edouard Oger, Alfred Capus (1904), with appreciations by various authors, in the series of Calétaires d'aujourd'hui.

CAPYBARA, or CARPINCHO (Hydrochoerus capybara), the largest living rodent mammal, characterized by its moderately long limbs, partially-webbed toes, of which there are four in front and three behind, hoof-like nails, sparse hair, short ears, cleft upper lip and the absence of a tail. The dentition is peculiar on account of the great size and complexity of the last upper molar, which is composed of about twelve plates, and exceeds in length the three teeth in front. The front surface of the incisors has a broad, shallow groove. Capybaras are aquatic rodents, frequenting the banks of lakes and rivers, and
being sometimes found where the water is brackish. They
generally associate in herds, and spend most of the day in covert
on the banks, feeding in the evenings and morning. When
disturbed they make for the water, in which they swim and dive
with expertness, often remaining below the surface for several
minutes. Their usual food consists of water-plants and bark,
but in cultivated districts they do much harm to crops. Their
cry is a low, abrupt grunt. From five to eight is the usual
number in a litter, of which there appears to be only one in the
year; and the young are carried on their parent’s back when
in the water. Extinct species of capybara occur in the tertiary
deposits of Argentina, some of which were considerably larger
than the living form. Capybaras belong to the family Capyridae,
the leading characteristics of which are given in Rodentia.
When full-grown the entire length of the animal is about 4 ft.,
and the girth 3 ft. Their geographical range extends from
Guiana to the river Plate. Capybaras can be easily tamed;
numbers are killed on land by jaguars and in the water by
calmanes—the alligators of South America.
CAR (Late Lat. carri), a term originally applied to a small
two-wheeled vehicle for transport (see Carriage), but also to
those passengers on each side of the horse. When
disturbance they make for the water, in which they swim and dive
with expertness, often remaining below the surface for several
minutes. Their usual food consists of water-plants and bark,
but in cultivated districts they do much harm to crops. Their
cry is a low, abrupt grunt. From five to eight is the usual
number in a litter, of which there appears to be only one in the
year; and the young are carried on their parent’s back when
in the water. Extinct species of capybara occur in the tertiary
deposits of Argentina, some of which were considerably larger
than the living form. Capybaras belong to the family Capyridae,
the leading characteristics of which are given in Rodentia.
When full-grown the entire length of the animal is about 4 ft.,
and the girth 3 ft. Their geographical range extends from
Guiana to the river Plate. Capybaras can be easily tamed;
numbers are killed on land by jaguars and in the water by
calmanes—the alligators of South America.
CAR.—CARACAL

CARACAL, the capital of the department of Romanatzi,
Rumania; situated in the plains between the lower reaches of
the Jiu and Olt rivers, and on the railway from Corabia, beside
the Danube, to Hermannstadt in Transylvania. Pop. (1900)
12,055. Caracal has little trade, except in grain. Its chief
buildings are the prefecture, school of arts and crafts and several
churches. There are some ruins of a tower, built in A.D. 217 by
the Roman emperor Caracalla, after whom the place is named.
In 1596 Michael the Brave of Walachia defeated the Turks near
Caracal.
CARACAL (Lynx caracal), sometimes called Persian lynx, an
animal widely distributed throughout south-western Asia, and
over a large portion of Africa. It is somewhat larger than a fox,
of a uniform reddish brown colour above, and whitish beneath,
with two white spots above each of the eyes, and a tuft of long
black hair at the tip of the ears; to these it owes its name, which
is derived from Turkish words signifying “black-ear.” There
is little information as to the habits of this animal in a wild
state. Dr W. T. Blanford considers that it dwells among grass
and bushes rather than in forests. Its prey is said to consist
largely of gazelles, small deer, hares and peafowl and other birds.
The caracal is easily tamed, and in some parts of India is trained
to capture the smaller antelopes and deer and such birds as the
crane and pelican. According to Blyth, it is a favourite amuse-
ment among the natives to let loose a couple of tame caracals
CARACALLA—CARACCI

among a flock of pigeons feeding on the ground, when each will strike down a number of birds before the flock can escape. Frequent reference is made in Greek and Roman literature to the lynx, and from such descriptions as are given of it there is little doubt that the caracal, and not the European lynx, was referred to. In South Africa, where the caracal abounds, its hide is made into Zulus into skin-coats, known as karosses. According to W. L. Sclater, these when used as blankets are said to be beneficial in cases of rheumatism; an ointment prepared from the fat of the animal being employed for the same purpose. The North African caracal has been separated as Lyca, or Caracal, barberrum, but it is best regarded as a local race.

CARACALLA (or CARACALLUS), MARCUS AURELIUS ANTONINUS (186—217), Roman emperor, eldest son of the emperor Septimius Severus, was born at Lugdunum (Lyons) on the 4th of April 186. His original name was Bassianus; his nickname Caracalla was derived from the long Gallic tunic which he wore and introduced into the army. He further received the imperial title of Marcus Aurelius Antoninus at the time when his father declared himself the adopted son of M. Aurelius. After the death of Severus (211) at Eboracum (York) in Britain, Caracalla and his brother Geta, who had accompanied their father, returned to Rome as colleagues in the supreme power. In order to secure the sole authority, Caracalla barbarously murdered his brother in his mother's arms, and at the same time put to death some 20,000 persons, who were suspected of mourning him, amongst them the Jews, Papinianus. An important act of his reign (212) was the bestowal of the rights of Roman citizenship upon all free inhabitants of the empire, although the main object of Caracalla was doubtless to increase the amount of revenue derived from the tax on inheritances or legacies to which only Roman citizens were liable. His own extravagances and the demands of the soldiery were a perpetual drain upon his resources, to meet which he resorted to taxes and extortions of every description. He spent the remainder of his reign wandering from place to place, a mode of life to which he was said to have been driven by the pangs of remorse. Handing over the reins of government to his mother, he set out in 213 for Raetia, where he carried on war against the Alamanni; in 214 he attacked the Goths in Dacia, whence he proceeded by way of Thrace to Asia Minor, and in 215 crossed to Alexandria. Here he took vengeance for the bitter sarcasms of the inhabitants against himself and his mother by ordering a general massacre of the youths capable of bearing arms. In 216 he ravaged Mesopotamia because Artabanus, the Parthian king, refused to give him his daughter in marriage. He spent the winter at Edessa, and in 217, when he recommenced his campaign, he was murdered by the eunuchs Edeon and Carrhae on the 5th of April at the instigation of Opellius (Opillus) Macrinus, prefect of the praetorian guard, who succeeded him. Amongst the numerous buildings with which Caracalla adorned the city, the most famous are the thermae, and the triumphal arch of Septimus Severus in the forum.

CARÁCAS, the principal city and the capital of the United States of Venezuela, situated at the western extremity of an elevated valley of the Venezuelan Coast Range known as the plain of Chacao, 63 m. S.S.E. of La Guaira, its port on the Caribbean coast, in lat. 10° 30' N., long. 67° 4' W. The plain is about 11 m. long by 3 m. wide, and is separated from the coast by a part of the mountain chain which extends almost entirely the entire water front of the republic. It is covered with well-cultivated plantations. The Guaira river, a branch of the Tuy, traverses the plain from west to east, and flows past the city on the south. Among its many small tributaries are the Caruche, Caoata and Anaoco, which flow down through the city from the north and give it a natural surface drainage. The city is built at the narrow end of the valley and at the foot of the Cero de Avila, and stands from 2887 to 3442 ft. above sea level, the elevation of the Plaza de Bolivar, its topographical centre, being 502 ft. Two miles north-east is the famous Silla de Caracas, whose twin summits, like a gigantic old-fashioned saddle (silla), rise to an elevation of 8622 ft.; and the Naigueté, still farther eastward, overlooks the valley from a height of 9186 ft. The climate of Caracas is often described as that of perpetual spring. It is subject, however, to extreme and rapid variations in temperature, to alternations of dry and humid winds (the latter, called catias, being irritating and oppressive), to chilling night mists brought up from the coast by the westerly winds, and to other influences productive of malaria, catarrh, fevers, bilious disorders and rheumatism. The maximum and minimum temperatures range from 84° to 48° F., the annual mean being about 66°, and the daily variation is often as much as 15°. The city is built with its streets running between the cardinal points of the compass and crossing each other at right angles. Two intersecting central streets also divide the city into four sections, in each of which the streets are methodically named and numbered, as North 3rd, 5th, 7th, &c., or West 2nd, 4th, 6th, &c., according to direction and location. This method of designation dates from the time of Guzman Blanco, but the common people adhere to the names bestowed upon the city squares in earlier times. The streets are narrow, but are clean and well-paved; they are lighted by gas. There are several handsome squares and public gardens, adorned with statues, trees and shrubbery. The principal square is the Plaza de Bolivar, the conventional centre of the city, in which stands a bronze equestrian statue of Bolivar, and on which face the cathedral, archbishop's residence, Casa Amarilla, national library, general post office and other public offices. The Independencia Park, formerly called Calvario Park, which occupies a hill on the west side of the city, is the largest and most attractive of the public gardens. Among the public edifices are the capitol, which occupies a whole square, the university, of nearly equal size, the cathedral, pantheon, masonic temple (built by the state in the spendthrift days of Guzman Blanco), national library, opera-house, and a number of large churches. The city is generously provided with all the modern public services, including two street car lines, local and long distance telephone lines, electric power and light, and waterworks. The principal water supply is derived from the Macarao river, 15 m. distant. Railway connexion with the port of La Guaira was opened in 1883 by means of a line 23 m. long. Another line (the Gran Ferrocarril de Venezuela) passes through the mountains to Caracas, 111 m. distant, and two short lines run to neighbouring villages of Petare and Santa Lucia, and the other to El Valle. The archbishop of Venezuela resides in Caracas and has ecclesiastical jurisdiction over the dioceses of Ciudad Bolivar, Calabozo, Barquisimeto, Mérida and Maracaibo. There are no manufactures of note.

Carácas was founded in 1567 by Diego de Losada under the pious title of Santiago de León de Carácas, and has been successively capital of the province of Carácas, of the captaincy-general of Carácas and Venezuela, and of the republic of Venezuela. It is also one of the two chief cities, or capitals, of the Federal district. It was the birthplace of Simón Bolívar, and claims the distinction of being the first colony in South America to overthrow Spanish colonial authority. The city was almost totally destroyed by the great earthquake of 1812. In the war of independence it was repeatedly subjected to pillage and slaughter by both parties in the strife, and did not recover its losses for many years. In 1810 its population was estimated at 50,000; seventy-one years later the census of 1881 gave it only 55,638. In 1891 its urban population was computed to be 72,429, which in 1904 was estimated to have increased to about 90,000.

CARACCI, LODOVICO, AGOSTINO, and ANNIBALE, three celebrated Italian painters, were born at Bologna in 1555, 1557, and 1560 respectively. Lodovico, the eldest, son of a butcher, was uncle to the two younger, Agostino and Annibale, sons of a tailor, and had nearly finished his professional studies before the
others, who had begun their education. From being a reputed dunce, while studying under Tintoretto in Venice, he gradually rose, by an attentive observation of nature and a careful examination of the works of the great masters preserved at Bologna, Venice, Florence and Parma, to measure himself with the teachers of his day, and ultimately projected the opening of a rival school in his native place. Finding himself unable to accomplish his design without assistance, he sent for his two nephews, and induced them to abandon their handicrafts (Agostino being a goldsmith, and Annibale a tailor) for the profession of painting. Agostino had been placed under the care of Fontana, retaining Annibale in his own studio; but he afterwards sent both to Venice and Parma to copy the works of Titian, Tintoretto and Correggio, on which his own taste had been formed. On their return, the three relatives, assisted by an eminent anatomist, Anthony de la Tour, opened, in 1589, an academy of painting under the name of the Incamminati (or, as we might paraphrase it, the Right Road), provided with numerous casts, books and bassi-rilievi, which Lodovico had collected in his travels. From the affability and kindness of the Caracci, and their zeal for the scientific education of the students, their academy rose rapidly in popular estimation, and soon every other school of art in Bologna was deserted and closed. They continued together till, at the invitation of Cardinal Farnese, Annibale and Agostino went to Rome, to paint the gallery of the palace. The superior praises awarded to Agostino inflamed the jealousy of Annibale, already kindled by the brilliant reception given by the pupils of the Incamminati to Agostino's still highly celebrated picture of the "Communion of St. Jerome," and the latter was dismissed to Parma to paint the great saloon of the Casino. Here he died in 1602, when on the eve of finishing his renowned painting of "Celestial, Terrestrial and Venal Love." Annibale continued to work alone at the Farnese gallery till the designs were completed; but, disappointed at the miserable remuneration offered by the cardinal, he retired to Naples, where an unsuccessful contest for a great work in the church of the Jesuits threw him into a fever, of which he died in 1609. Lodovico always remained at his academy in Bologna (excepting for a short visit to his cousin at Rome), though invited to execute paintings in all parts of the country. He died in 1610, and was interred in the church of Santa Maria Maddalena. The works of Lodovico are numerous in the chapels of Bologna. The most famous are—The "Madonna standing on the moon, with St. Francis and St. Jerome beside her, attended by a retinue of angels"; "John the Baptist," "St. Jerome," "St. Benedict," and "St. Cecilia," all his works in the church of the Incamminati. He was by far the most amiable of the three painters, rising superior to all feelings of jealousy towards his rivals, and though he received large sums for his productions, yet, from his almost unparalleled liberality to the students of the academy, he died poor. With skill in painting, Agostino combined the greatest proficiency in engraving (which he had studied under Cornelius de Cort) and high accomplishments as a scholar. He died not unbefriended by remorse for the indecencies which, in accordance with the corruption of the time, he had introduced into some of his engravings. The works of Annibale are more diversified in style than those of the others, and comprise specimens of painting after the manner of Correggio, Titian, Paolo Veronese, Raphael and Michelangelo. The most distinguished are the "Dead Christ in the lap of the Madonna"; the "Infant and St. John;" "St. Catherine;" "St. Roch distributing alms" (now in the Dresden gallery); and the "Saviour wailed over by the Maries," at present in possession of the earl of Carlisle. He frequented gave great importance to the landscape in his compositions. The reputation of Annibale is tarnished by his jealousy and vindictiveness towards his brother, and the licentiousness of his disposition, which contributed to bring him to a comparatively early grave.

The three Caracci were the founders of the so-called Eclectic school of painting,—the principle of which was to study in the works of the great masters the several excellences for which they had been respectively pre-eminent, and to combine these in the productions of the school itself; for instance, there was to be the design of Raphael, the power of Michelangelo, the colour of Titian, and so on. See A. Venturi, I Caracci e la loro scuola, 1895. (W. M. R.)

CARACCILO, FRANCESCO, Prince (1732–1799), Neapolitan admiral and revolutionist, was born on the 18th of January 1732, of a noble Neapolitan family. He entered the navy and learned his seamanship under Rodney. He fought with distinction in the British service in the American War of Independence, against the Barbary pirates, and against the French at Toulon under Lord Hotham. The Bourbons placed the greatest confidence in his skill. When on the approach of the French to Naples King Ferdinand IV, and Queen Mary Caroline fled to Sicily on board Nelson’s ship the “Vanguard” (December 1798), Caracciolo escorted them on the frigate “Sannita.” He was the only prominent Neapolitan trusted by the king, but even the admiral’s loyalty was shaken by Ferdinand’s cowardly flight. On reaching Palermo Caracciolo asked permission to return to Naples to look after his own private affairs (January 1799). This was granted, but when he arrived at Naples he found all the aristocracy and educated middle classes infatuated with the French revolutionary ideas, and he himself was received with great enthusiasm. He seems at first to have intended to live a retired life; but, finding that he must either join the Republican army or escape to Procla, then in the hands of the English, in which case the king threatened to make him a traitor and his property would have been confiscated, he was induced to adhere to the new order of things and took command of the republic’s naval forces. Once at sea, he fought actively against the British and Neapolitan squadrons and prevented the landing of some Royalist bands. A few days later all the French troops in Naples, except 500 men, were recalled to the north of Italy.

Caracciolo then attacked Admiral Thurn, who from the “Minerva” commanded the Royalist fleet, and did some damage to that vessel. But the British fleet on the one hand and Cardinal Fabrizio Ruffo’s army on the other made resistance impossible. The Republicans and the 500 French had retired to the castles, and Caracciolo landed and tried to escape in disguise. But he was betrayed and arrested by a Royalist officer, who on the 29th of June brought him in chains on board Nelson’s flagship the “Foudroyant.” It is doubtful whether Caracciolo should have been included in the capitulation concluded with the Republicans in the castles, as that document promised life and liberty to those who surrendered before the blockade of the forts, whereas there was no capitulation before which he surrendered. The death of the admiral was promptly immolated. Moreover, the admiral’s fate was decided even before his capture, because on the 27th of June the British minister, Sir W. Hamilton, had communicated to Nelson Queen Mary Caroline’s wish that Caracciolo should be hanged. As soon as he was brought on board, Nelson ordered Thurn to summon a court martial composed of Caracciolo’s former officers, Thurn himself being a personal enemy of the accused. The court was held on board the “Foudroyant,” which was British territory—a most indefensible proceeding. Caracciolo was charged with high treason; he had asked to be judged by British officers, which was refused, nor was he allowed to summon witnesses in his defence. He was condemned to death by three votes to two, and as soon as the sentence was communicated to Nelson the latter ordered that he should be hanged at the yard-arm of the “Minerva” the next morning, and his body thrown into the sea at sundown. Even the customary twenty-four hours’ respite for confession was denied him, and his request to be shot instead of hanged was refused. The sentence was duly carried out on the 30th of June 1799. Caracciolo was technically a traitor to the king whom he had served, and was technically a traitor to the state, and he appeared to be technically a traitor to the country. But when Nelson wrote to the king of Naples, saying that Caracciolo had fled from his service, he wrote in the name of the British nation. Nelson himself was in the service of the United States, and the nation had no more cause to blame Caracciolo for his political ideas than if he had been an American citizen. He was a man of genius, who was betrayed by a Jacobin education. He perished, and although he appears to have been guilty of treason, it is probable that he was more a victim of circumstances than a traitor. He is said to have been able to say in Italian, "Caracciolo, che cosa sono i consanguinei?" (What are my relations?)
CARACOLE—CARALES

committed against his own country by sacrificing his inalienable character as the representative of the king of Great Britain to his own ambition; and died on the 30th of April, 1848, at a date of the king of Naples. The only explanation of Nelson’s conduct is to be

found in his infatuation for Lady Hamilton, whose low ambition made her use her influence over him in the interest of Queen Mary Caroline’s malignant spite.

AUTHORITIES.—Besides the general works on Nelson and Naples, such as P. Colletta’s Storia dei Regni di Napoli (Florence, 1848), there is a large amount of special literature on the subject. Nelson and the Neapolitan Jacobins (Naval Records Society, 1903) contains all the documents on the episode, including those incorrectly transcribed by A. Dumas in his Horizons di Napoli (Naples, 1862–1863), with an introduction defending Nelson by H. C. Gutteridge. The work contains a bibliography. The case against Nelson is set forth by Professor P. Villari in his article “Nelson, Caracciolo, e la Repubblica Napoletana” (Nuova Antologia, 16th February 1899); Captain A. T. Chauncy has replied in “The Neapolitan Republic and Nelson’s Accusers” (English Historical Review, July 1899), “Nelson at Naples” (ibid., October 1899), and “Nelson at Naples” (Athenaeum, 8th July 1899); see also F. Lenni, Nelson e Caracciolo (Florence, 1898); C. Giglioli, Naples in 1799 (London, 1903); Freiherr von Helfert, Fabrizio Russo (Vienna, 1882); H. Hiffer, Die neapolitanische Republik des Jahres 1799 (Leipzig, 1884). (L. V.)

CARACOLE (a Fr. word, the origin of which is doubtful, meaning the wheeling about of a horse; in Spanish and Portuguese caracol means a snail with a spiral shell), a turn or wheeling in horsemanship to the left or right, or to both alternately, so that the movements of the horse describe a zig-zag course.

The term has been used loosely and erroneously to describe any display of fancy riding. It is also used for a spiral staircase in a tower.

CARACTACUS, strictly Caratacus, the Latin form of a Celtic name, which survives in Caradoc and other proper names. The most famous bearer of the name was the British chieftain who led the native resistance to the Roman invaders in a.d. 48–51, and was finally captured and sent to Rome (Tac. Ann. xii. 35. Dio. l.). Two old camps on the Welsh border are now called Caer Cadoc, and the name seems to be the inceptive form of ancient quarries and not genuinely ancient memorials of the Celtic hero.

CARADOC SERIES, in geology, the name introduced by R. J. Murchison in 1839 for the sandstone series of Caer Caradoc in Shropshire, England. The limits of Murchison’s Caradoc series have since been somewhat modified, and through the labours of C. Lapworth the several members of the series have been precisely defined by means of graptolitic zones. These zones are identical with those found in the rocks of the same age in North Wales, the Bala series (q.v.), and the terms Bala or Caradoc series are used indifferently by geologists when referring to the uppermost substage of the Ordovician System. The Ordovician rocks of the Caradoc district have been subdivided into the following beds, in ascending order: the Trinucleus shales, Acton Scott beds, Longville flags, Chatwell and Souldley sandstones, Harnage shales and Hawke Edge grits and limestone. In the Corndon district in the same county the Caradoc series is represented by the Marrington group of ashes and shales and the Spy Wood group beneath them; these two groups of strata are sometimes spoken of as the Chirbury series. In the Breidden district are the burren Criggion shales with ashes and flows of andesite.

In the Lake district the Coniston limestone series represents the Upper Caradocian, the lower portion being taken up by the greater Borrowdale series rocks. The Coniston limestone series contains the following subdivisions:—

Ashgill group (Ashgill shales and Steurocephalus limestones).
Kesley limestones.
Skeelda lime conglomerate.
Skeel Crag (Applethwaite beds = Upper Coniston limestone conglomerate; Yarlside rhyolite; styw end beds = Lower Coniston limestone).
Roman Fell group (Corona beds).

The Dutton shales and Drygill shales are equivalents of the Skeeladale group.

Rocks of Caradoc age are well developed in southern Scotland; in the Graven district they have been described as the Ardmillan series with the Drummock group and Barren Flagstone in the upper portion, and the Whitehouse, Ardwell and Balchaithe groups in the lower part. Similarly, two divisions, known as the Upper and Lower

Harfell series, are recognized in the southern and central area, in Peeblesshire, Ayrshire and Dumfriesshire.

In Ireland the Caradoc or Bala series is represented by the limestone of Portane near Dublin and of the Chair of Kildare; by the Ballymoney series of Wexford and Caralea shales of Co. Down. In the Lough Mask district beds of this age are found, as in Wales, interstratified with volcanic lavas and tuffs. Other localities are known in counties Tyrone, Meath and Louth, also in Lambay Island. Such rocks are described by C. Layard in the Mag. Nat. Hist., 5th series, vols. i., 1850; Geol. Mag., 1859; C. Lapworth and W. W. Watts, Proc. Geol. Assoc., iii., 1894; J. E. Marr, Geol. Mag., 1892; J. E. Marr and T. Roberts, Q. J. G. S., 1895; B. N. Peach and J. Horne, “Silurian Rocks of Great Britain,” vol. i., 1899 (Mem. Geol. Survey). (J. A. H.)

CARALES (Gr. Κάραλεϊς, mod. Cagliari, q.v.), the most important ancient city of Sardinia, situated on the south coast of the island. Its foundation is generally attributed to the Carthaginians, and Punic tombs exist in considerable numbers near the present cemetery on the east and still more on the rocky plateau to the north-west of the town. It first appears in Roman history in the Second Punic War, and probably obtained full Roman civic rights from Julius Caesar. In imperial times it was the most important town in the island, mainly owing to its firm sheltered harbour, where a detachment of the classis Misenus was stationed. In the 4th and 5th centuries it was probably the seat of the procaes Sardiniae. It is mentioned as an important harbour in the Gothic and Gildonic wars. It was also the chief point of the road system of Sardinia. Roads ran hence to Olbia by the east coast, and through the centre of the island, to Othoca (Oristano) direct, and thence to Olbia (probably the most frequented route), through the mining district to Sulci and along the south and west coasts to Othoca. The hill occupied by the Pisan fortifications and the medieval town within them must have been the acropolis of the Carthaginian settlement; it is impossible to suppose that a citadell presenting such natural advantages was not occupied. The Romans, too, probably made use of it, though the lower quarters were mainly occupied in imperial times. A. Taramelli (Notizie degli Scavi, 1905, 41 seq.) rightly points out that the nucleus of the Roman municipium is probably represented by the present quarter of the Marina, in which the streets intersect at right angles and Roman remains are frequently found in the subsoil. An inscription was found near the hill pedestal on which the amphitheatre stands the amphitheatre was found of paving in the squares and streets, and of drains constructed under Domitian in a.d. 83. (F. Vivian in Notizie degli Scavi, 1897, 279.) The amphitheatre occupies a natural depression in the rock just below the acropolis, and open towards the sea with a fine view. Its axes are 93½ and 79 yds. and it is in the main cut in the rock, though some parts of it are built with concrete. Below it, to the south, are considerable remains of ancient reservoirs for rain-water, upon which the city entirely depended. This nucleus extended both to the east and to the west; in the former direction it ran some way inland, on the east of the castle hill. Here were the ambulazioni or public promenades constructed by the pro-consl Q. Caecilius Metellus before a.d. 6 (Corp. Inscrip. Lat. x., Berlin, 1853, No. 7581). Here also, not far from the shore, the remains of Roman baths, with a fine coloured mosaic pavement, representing deities riding on marine monsters, were found in 1907. To the east was the necropolis of Bonaria, where both Punic and Roman tombs exist, and where, on the site of the present cemetery, Christian catacombs have been discovered (F. Vivian in Notizie degli Scavi, 1893, 183 seq.; F. Pinza in Nuovo Bollettino di Archeologica Cristiana, 1901, 37 seq.). But the early history of Carales is more important; it extended along the lagoon of S. Gilla (which lies to the north-west of the town, and which until the middle ages was an open bay) and on the lower slopes of the hill which rises above it. The chief discoveries which have been made are noted by Taramelli (loc. cit.) and include some important buildings, of which a large Roman house (or group of houses) is the only one now visible (G. Spatio in Notizie degli Scavi, 1876, 148, 173; 1877, 225; 1880, 405). Beyond this quarter begins an extensive Roman necropolis extending along the edge of the hill north-east of the road leading to the north-west; the most
important tomb is the so-called Grotta delle Vipere, the rock-hewn tomb of Cassius Philippus and Atilla Pompitilla, the sides of which are covered with inscriptions (Corpus Inscrip. Lat. x., Berlin, 1883, Nos. 7563-7578). Other tombs are also to be found on the high ground near the Punic town, already mentioned. The latter are hewn perpendicularly in the rock, while the Roman tombs are chambers excavated horizontally. In the lagoon itself were found a large number of terra cottas, made of local clay, some being masks of both divinities and men (among them grotesques) others representing hands and feet, others various animals, and of amphorae of various sizes and other vases. Some of the amphorae contained animals’ bones, possibly the remains of sacrifices. These objects are of the Punic period; they were all found in groups, and had apparently been arranged on a platform of piles in what was then a bay, in readiness for shipment (F. Vivian in Notizie degli Scavi, 1893, 255). It is probable that the acropolis of Carales was occupied even in prehistoric times; but more abundant traces of prehistoric settlements (pottery and fragments of obsidian, also kitchen middens, containing bones of animals and shells of molluscs used as a means for food) have been found by Capo S. Elia near the south-east of the modern town (see A. de Gandini in Notizie degli Scavi, 1904, 19 seq.). An inscription records the existence of a temple of Venus Erycina on this promontory in Roman times. The museum contains an interesting collection of objects from many of the sites mentioned, and also from other parts of the island; it is in fact the most important in Sardinia, and is especially strong in prehistoric bronzes (see SARDINIA).

For the Roman inscriptions see C. I. L. cix., Nos. 7552-7807. (T. As.)

CARAN D’ACHE—CARAVAGGIO, M. A. DA

The little room notably was Emmanuel of the short-lived story among the parts Roman settlements of many important remains, which are the tombs of for the high ground, but especially being the most Roman temple of the high ground, and of the city of Rome, as the city of Rome, and of the city of Rome by the emperor Maximian at Gessouracum (Bononia, Boulogne) to protect the coats and channel of the Frankish and Saxon pirates. He at first acted energetically, but was subsequently accused of having entered into partnership with the barbarians and was sentenced to death by the emperor. Carausius thereupon crossed over to Britain and proclaimed himself an independent ruler. The legions at once joined him; numbers of Franks enlisted in his service; an increased and well-equipped fleet secured him the command of the neighbouring seas. In 289 Maximian attempted to recover the island, but his fleet was damaged by a storm and he was defeated. Maximian and Diocletian were compelled to acknowledge the rule of Carausius in Britain; numerous coins are extant with the heads of Carausius, Diocletian and Maximian, bearing the legend of Carausius et fridericul.’ In 292 Constantius Chlorus besieged and captured Gessouracum (hitherto in possession of Carausius), together with part of his fleet and his naval stores. Constantius then made extensive preparations to destroy the reconquest of Britain, but before they were completed Carausius was murdered by Allectus, his prefect of the guards (Aurelius Victor, Caesars, 39; Eutropius ix. 21, 22; Eueniumus, Panegyrici lii. 12, v. 12). A Roman mile-stone found near Carlisle (1805) bears the inscription IMP. CAES[ar] M. AUR[elius] MAUS. The meaning of MAUS is doubtful, but it may be an anticipation of ARAUS (see F. J. Haverfield in Cumberland and Westmoreland Antiquarian Soc. Transactions, 1895, p. 437).

A copper coin found at Richborough, inscribed Domino Carausio Cesar., must be ascribed to a Carausius of later date, since the type of the reverse is not found until the middle of the 4th century at the earliest. Nothing is known of this Carausius (A. J. Evans in Christmas Chronicle, 1887, “On a coin of a second Carausius Caesar in Britain in the Fifth Century”).

See J. Watts de Peyster, The History of Caravaggio, the Dutch Augustus (1858); P. H. Webb, The Reign and Coinage of Caravaggio (1908).

CARAVACA, a town of south-eastern Spain, in the province of Murcia; near the left bank of the river Caravaca, a tributary of the Segura. Pop. (1900) 15,846. Caravaca is dominated by the medieval castle of Santa Cruz, and contains several convents and a fine parish church, with a miraculous cross celebrated for its healing power, in honour of which a yearly festival is held on the 3rd of May. The hills which extend to the north are rich in marble and iron. Despite the lack of railway communication, the town is a considerable industrial centre, with large iron-works, tanneries and manufactories of paper, chocolate and oil.

CARAVAGGIO, MICHELANGELO AMERIGHI (or MIRIGI) DA (1550–1600), Italian painter, was born in the village of Caravaggio, in Lombardy, from which he received his name. He was originally a mason’s labourer, but his powerful genius directed him to painting, at which he worked with immuttable energy and amazing force. He despised every sort of idealism whether noble oremasculative, became the head of the Naturalist (unmodified imitators of ordinary nature) in painting, and adopted a style of potent contrasts of light and shadow, laid on with a sort of fury, indicative of that fierce temper which led the artist to commit a homicide in a gambling quarrel at Rome. To avoid the consequences of his crime he fled to Naples and to Malta, where he was imprisoned for another attempt to avenge a quarrel. Escaping to Sicily, he was attacked by a party sent in pursuit of him, and severely wounded. Being pardoned, he set out for Rome; but having been arrested by mistake before his arrival, and afterwards released, and left to shift for himself in excessive heat, and still suffering from wounds and hardships,
he died of fever on the beach at Pontercole in 1609. His best pictures are the "Entombment of Christ," now in the Vatican; "St. Sebastian," in the Roman Capitol; a magnificent whole-length portrait of a grand-master of the Knights of Malta, Alof de Vignacourt, and his page, in the Louvre; and the Borghese "Supper at Emmaus."

CARAVAGGIO, POLIDORO CALDARA DA (1495 or 1492-1543), a celebrated painter of frieze and other decorations in the Vatican. His merits were such that, while a mere mortar-carrier to the artists engaged in that work, he attracted the admiration of Raphael, then employed on his great pictures in the Loggie of the palace. Polidoro's works, as well as those of his master, Maturino of Florence, have mostly perished, but are well known by the fine etchings of P. S. Bartoli, C. Alberti, &c. On the sack of Rome by the army of the Constable de Bourbon in 1527, Polidoro fled to Naples. Thence he went to Messina, where he was much employed, and gained a considerable fortune, with which he was able to return to the mainland of Italy when he was robbed and murdered by an assistant, Tonno Calabrese, in 1543. Two of his principal paintings are a Crucifixion, painted in Messina, and "Christ bearing the Cross" in the Naples gothic palace.

CARAVAN (more correctly Karavan), a Persian word, adopted into the later Arabic vocabulary, and denoting, throughout Asiatic Turkey and Persia, a body of traders travelling together for greater security against robbers (and in particular against Bedouins, Kurds, Turks, and the like, whose grazing grounds the proposed route may traverse) and for mutual assistance in the matter of provisions, water and so forth. These precautions are due to the absence of settled government, inns and roads. These conditions having existed from time immemorial in the major part of western Asia, and still existing, caravans always have been the principal means for the transfer of merchandise. In these companies camels are generally employed for the transport of heavy goods, especially where the track, like that between Damascus and Bagdad, for example, lies across level, sandy and arid districts. The camels are harnessed in strings of fifty or more at a time, a hair-rope connecting the rear of one beast with the head of another; the leader is gaily decorated with pearl-coloured trappings, tassels and bells; an unladen ass procurates the water file, for he has some, for guiding and carrying others. Where the route is rocky and steep, as that between Damascus and Aleppo, mules, or even asses, are used for burdens. The wealthier members ride, where possible, on horseback. Every man carries arms; but these are in truth more for show than for use, and are commonly flung away in the presence of any serious robber attack. Should greater peril than ordinary be anticipated, the protection of a company of soldiers is habitually pre-engaged,—an expensive, and ordinarily a useless adjunct. A leader or director, called Karawan-Bashi (headman), or, out of compliment, Karawan-Serasker (general), but most often simply designated Rats (chief), is before starting appointed by common consent. His duties are those of general manager, spokesman, arbitrator and so forth; his remuneration is indefinite. But in the matter of sales or purchases, either on the way or at the destination, each member of the caravan acts for himself.

The number of camels or mules in a single caravan varies from forty to six hundred and more; sometimes, as on the reopening of a long-closed route, it reaches a thousand. The ordinary caravan seasons are the months of spring, early summer and later autumn. Friday, in accordance with a recommendation made in the Koran itself, is the favourite day for setting out, the most auspicious hour being that immediately following noonday prayer. The first day's march never does more than just clear the starting-point. Subsequently each day's route is divided into two stages,—from 3 or 4 A.M. to about 10 in the forenoon, and from between 2 and 3 P.M. till 6 or even 8 in the evening. Thus the time passed daily on the road averages from ten to twelve hours, and, as the ordinary pace of a laden camel does not exceed 2 m. an hour, that of a mule being 2½, a distance varying from 25 to 50 m. is gone over every marching day. But prolonged halts of two, three, four and even more days often occur. The hours of halt, start and movement, the precise line of route, and the selection or avoidance of particular localities are determined by common consent. But if, as sometimes happens, the services of a professional guide, or those of a military officer have been engaged, his decisions are final. While the caravan is on its way, the five stated daily prayers are, within certain limits, anticipated, deferred or curtailed, so as the better to coincide with the regular and necessary halts,—a practice authorized by orthodox Mahomedan custom and tradition.

Two caravans are mentioned in Genesis xxxvii.; the route on which they were passing seems to have coincided with that nowadays travelled by Syrian caravans on their way to Egypt. Other allusions to caravans may be found in Job, in Isaiah and in the Psalms. Eastern literature is full of such references.

The yearly pilgrim-bands, bound from various quarters of the Mahomedan world to their common destination, Mecca, are sometimes, but inaccurately, styled by European writers caravans; their proper designation is Hajj, a collective word for pilgrimage and pilgrims. The two principal pilgrim-caravans start yearly, the one from Mecca, which is mentioned, with the first-hand statements of the Levantine and Marseilles merchants, the account given by the Arab historians, and the utterance of the pilgrim himself, to be the most correct, as the other, for the most part, is matter of hearsay, and the further the witness is removed from the scene of events, the more likely is he to add a shade of romantic colour to the simple truth which he relates. But, as this is the only available account of the Hajj, and there are not, indeed, many, who have traversed the whole route, we may be content with it, and should not, perhaps, be unsatisfied with the facts which it supplies. The two principal pilgrim-caravans started from Mecca yearly, the one from Mecca, the other from Cairo in Egypt. This latter was formerly joined on its route, near Akaba of the Red Sea, by the North African Hajj, which, however, now goes from Egypt by sea from Suez; the former gathers up bands from Anatolia, Kurdistan, Mesopotamia and Syria. Besides these a third, but smaller Hajj of Persians, chiefly set out from Sorkh-Shiyouk, in the neighbourhood of Meshed Ali, on the lower Euphrates; a fourth of negroes, Nubians, &c., unite at Yambu on the Hejaz coast, whither they have crossed from Kossieux in Upper Egypt; a fifth of Indians and Malays, centres at Jidda; a sixth and seventh, of southern or eastern Arabs arrive, the former from Yemen, the latter from Nejd.

The Syrian Hajj is headed by the pasha of Damascus, either in person or by a vicarious official of high rank, and is further accompanied by the Sorrak Amir or "Guardian of the Purse," a British officer from Constantinople. The Egyptian company is commanded by an amir or ruler, appointed by the Cairo government, and is accompanied by the famous "Makmal" or sacred pavilion. The other bands above mentioned have each their own amir, besides their mewakwas or agents, whose business it is to see after provisions, water and the like, and are not seldom encumbered with a numerous retinue of servants and other attendants. Lastly, a considerable force of soldiers accompanies both the Syrian and the Egyptian Hajj.

No guides properly so-called attend these pilgrim-caravans; the routes followed being invariably the same, and well known. But Bedouin bands generally offer themselves by way of escort, and not seldom designedly lead their clients into the dangers from which they bargain to keep them safe. This they are the reader to do because, in addition to the personal luxuries with which many of the pilgrims provide themselves for the journey, a large amount of wealth, both in merchandise and coins, is habitually to be found among the travellers, who, in accordance with Mahomedan tradition, consider it not merely lawful but prize-worthy to unite mercantile speculation with religious duty. Nor has any one, the pasha himself or the amir, the military, when present, excepted, any acknowledged authority or general control in the pilgrim-caravans; nor is there any orderly subdivision of management or service. The pilgrims do, indeed, often coalesce in companies among themselves for mutual help, but necessity, circumstance or caprice governs all details, and thus it happens that numbers, sometimes as many as a third of the entire Hajj, yearly perish by their own negligence or by misfortune,—dying, some of thirst, others of fatigue and sickness, others at the hand of robbers on the way. In fact the principal

---

1 In Arabia proper it is rarely employed in speech and never in writing, strictly Arabic words such as Ribb ("assembled riders") or Qafla ("wayfaring band") being in ordinary use.

2 The Syrian and Egyptian Hajj have been able, since 1908, to travel by the railway from Damascus to the Hejaz.
CARAVANSERAI—CARBAZOL

routes are in many places lined for miles together with the bones of camels and men. The numbers which compose these pilgrimage caravans are much exaggerated by popular rumour; yet it is certain that the Syrian and Egyptian sometimes amount to 4000 each, with 25,000 or 30,000 camels in train. Large supplies of food and water have to be carried, the more so at times that the pilgrimage season, following as it does the Mahomedan calendar, which is lunar, falls for years together in the very hottest season. Hence, too, the journey is usually accomplished by night marches, the hours being from 3 to 4 P.M. to 6 or 7 A.M. of the following day. Torches are lighted on the road, the pace is slower than that of an ordinary caravan, and does not exceed 2 m. an hour.

See Mecca and Mahomedan Religion.

CARAVANSERAI, a public building, for the shelter of a caravan (q.v.) and of wayfarers generally in Asiatic Turkey. It is commonly constructed in the neighbourhood, but not within the walls, of a town or village. It is quadrangular in form, with a dead wall outside; this wall has small windows high up, but in the lower parts merely a few narrow air-holes. Inside a cloister-like arcade, surrounded by cellular store-rooms, forms the ground-floor; above it a light arcade, giving access to little dwelling-rooms, runs round it above. Broad open flights of stone steps connect the storeys. The central court is open to the sky, and generally has in its centre a well with a fountain-basin beside it. A spacious gateway, high and wide enough to admit the passage of a loaded camel, forms the sole entrance, which is furnished with heavy doors, and is further guarded by massive iron chains, drawn across at night. The entry is paved with flagstones, and there are stone seats on each side. The court itself is generally paved, and large enough to admit of three or four hundred crouching camels or tethered mules; the bales of merchandise are piled away under the lower arcade, or stored up in the cellars behind it. The upstairs apartments are for human lodging; cooking is usually carried on in one or more corners of the quadrangle below. Should the caravanserai be a small one, the merchants and their goods alone find place within, the beasts of burden being left outside. A porter, appointed by the municipal authority of the place, is always present, lodged just within the gate, and sometimes one or more assistants.

These form a guard of the building and of the goods and persons in it, and have the right to maintain order and, within certain limits, decorum; but they have no further control over the temporary occupants of the place, which is always kept open for all arrivals from prayer-time at early dawn till late in the evening. A small gratuity is expected by the porter, but he has no legal claim for payment, his maintenance being provided for out of the funds of the institution. Neither food nor provender is supplied.

Many caravanserais in Syria, Mesopotamia and Anatolia have considerable architectural merit; their style of construction is in general that known as Saracen; their massive walls are of hewn stone; their proportions apt and grand. The portals especially are often decorated with intricate carving; so also is the prayer-niche within. These buildings, with their belongings, are works of charity, and are supported, repaired and so forth out of funds derived from pious legacies, most often of land or rents. Sometimes a municipality takes on itself to construct and maintain a caravanserai; but in any case the institution is tax-free, and its revenues are inalienable. When, as sometimes happens, those revenues have been dissipated by peculation, neglect or change of times, the caravanseri passes through downward stages of dilapidation to total ruin (of which only too many examples may be seen) unless some new charity intervene to repair and renew it.

Khans, i.e. places analogous to inns and hotels, where not lodging only, but often food and other necessaries or comforts may be had for payment, are sometimes by inaccurate writers confounded with caravanserais. They are generally to be found within the town or village precincts, and are of much smaller dimensions than caravanserais. The Khan of Asad Pasha at Damascus is a model of constructive skill and architectural beauty.

CARAVEL, or CARVAL (from the Gr. καρβάĩος, a light ship, through the It. carabella and the Span. carabel), a name applied at different times and in different countries to ships of very varying appearance and build, as in Turkey to a ship of war, and in France to a small boat used in the hering fishery. In the 15th and 16th centuries, caravels were much used by the Portuguese and Spanish for long voyages. They were roundish ships, with a double tower at the stern, and a single one in the bows, and were galley rigged. Two out of the three vessels in which Columbus sailed on his voyage of discovery to America were "caravels." Carvel, the older English form, is now used only in the term "carvel-built," for a boat in which the planking is flush with the edges laid side to side, in distinction from "clinker-built," where the edges overlap.

CARAVELNAS, a small seaport of southern Bahia, Brazil, on the Caravellas river a few miles above its mouth, which is dangerously obstructed by sandbars. Pop. (1890) of the municipality 5482, about one-half of whom lived in the town. Caravellas was once the centre of a flourishing whale fishery, but has since fallen into decay. It is the port of the Bahia & Minas railroad, whose traffic is comparatively unimportant.

CARAWAY, the fruit, or so-called seed, of Carum Carvi, an umbelliferous plant growing throughout the northern and central parts of Europe and Asia, and naturalized in waste places in England. The plant has finely-cut leaves and compound umbels of small white flowers. The fruits are laterally compressed and ovate, the mericarps (the two portions into which the ripe fruit splits) being subcylindrical, slightly arched, and marked with five distinct pale ridges. Caraways evolve a pleasant aromatic odour when bruised, and they have an agreeable spicy taste. They yield from 3 to 6% of a volatile oil, the chief constituent of which is cymene aldehyde. Cymene itself is present, having the formula CH₂CH₃·CH·(CH₃)₂; also carvone, CH₃O·C₃H₇, and limonene, a terpene. The dose of the oil is ½-3 minims.

The plant is cultivated in north and central Europe, and Morocco, as well as in the south of England, the produce of more northerly latitudes being richer in essential oil than that grown in southern regions. The essential oil is largely obtained by distillation for use in medicine as an aromatic stimulant and carminative, and as a flavouring material in cookery and in liqueurs for drinking. Caraways are, however, more extensively consumed entire in certain kinds of cheese, cakes and bread, and they form the basis of a popular article of confectionery known as caraway comfits.

CARBALLO, a town of north-western Spain, in the province of Corunna; on the right bank of the river Allones, 20 m. S.W. of the city of Corunna. Pop. (1900) 15,932. Carballo is the central market of a thriving agricultural district. At San Juan de Carballo, on the opposite bank of the Allones, there are hot sulphurous springs.

CARBAZOL, C₅H₆N, a chemical constituent of coal-tar and crude anthracene. From the latter it may be obtained by fusion with caustic potash when it is converted into carbazol-potassium, which can be easily separated by distilling off the anthracene. It may be prepared synthetically by passing the vapours of diphenylamine or aniline through a red-hot tube; by heating diacridydinophenyl with 25% sulphuric acid to 200°C for 15 hours; by heating orthoaminophenyl with lime; or by heating thiophenylamine with copper powder. It is also obtained as a decomposition product of brucine or strychnine, when these alkaloids are distilled with zinc dust. It is easily soluble in the common organic solvents, and crystallizes in plates or tablets melting at 238°C. It is a very stable compound, possessing feebley basic properties and characterized by its ready sublimation. It distills unchanged, even when the operation is carried out in the presence of zinc dust. On being heated with caustic potash in a current of carbonic acid, it gives carbazol carbonic acid C₅H₆N·COOH; melted with oxalic acid it gives carbol blue. It dissolves in concentrated sulphuric acid to a clear yellow solution. The potassium salt reacts with the alkyl iodides to give N-substituted alkyl derivatives. It gives the pine-shaving reaction, in this respect resembling pyrrol (q.v.).
CARBIDE—CARBOLIC ACID

CARBIDE, in chemistry, a compound of carbon with another element. The introduction of the electric furnace into practical chemistry was followed by the preparation of many metallic carbides, tribromides, and oxides, some of which, especially calcium carbide, are now of great commercial importance. Carbides of the following general formulae have been obtained by H. Moissan (M denotes an atom of metal and C of carbon):—

\[ \text{MC} \quad \text{M} \quad \text{C} \quad \text{MC}_2 \quad \text{MC}_3 \quad \text{MC}_4 \quad \text{MC}_5 \quad \text{MC}_6 \quad \text{MC}_7 \quad \text{MC}_8 \]

The principal methods for the preparation of carbides may be classified as follows:—(1) direct union at a high temperature, e.g. lithium, iron, chromium, tungsten; (2) by the reduction of oxides with carbon at high temperatures, e.g. calcium, beryllium, manganese, chromium, and magnesium; (3) by the reduction of carbonates with magnesium in the presence of carbon, e.g. calcium, lithium; (4) by the action of metals on acetylene or metallic derivatives of acetylene, e.g. sodium, potassium. The metallic carbides are crystalline solids, the greater number being decomposed by water into a metallic hydrate and a hydrocarbon; sometimes hydrogen is also evolved. Calcium carbide owes its industrial importance to its decomposition into acetylene; lithium carbide behaves similarly. Methane is yielded by aluminium and beryllium carbides, and, mixed with hydrogen, by magnesium carbide. The important carbides are mentioned in the separate articles on the various metals. The commercial aspect of calcium carbide is treated in the article ACETYLENE.

CARBINE (Fr. carbine, Ger. Karabinier), a word which came into use towards the end of the 16th century to denote a form of small fire-arm, shorter than the musket and chiefly used by mounted men. It has retained this significance, though all subsequent modifications of small-arm design, to the present day, and is now as a rule a shortened and otherwise slightly modified form of the ordinary rifle (q.v.).

CARBO, the name of a Roman plebeian family of the gens Papiria. The following are the most important members in Roman history:

1. CAIUS PAPRIUS CARBO, statesman and orator. He was associated with C. Gracchus in carrying out the provisions of the agrarian law of Tiberius Gracchus (see GRACCHUS). When tribune of the people (131 B.C.) he carried a law extending voting by ballot to the enactment and repeal of laws; another proposal, that the tribune who had not used a cow for food in his service of office in the year immediately following, was defeated by the younger Scipio Africanus. Carbo was suspected of having been concerned in the sudden death of Scipio (129), if not his actual murderer. He subsequently went over to the optimates, and (when consul in 126) successfully defended Lucius Opimius, the murderer of Gaius Gracchus, when he was impeached for the murder of citizens without a trial, and even went so far as to say that Gracchus had been justly slain. But the optimates did not trust Carbo. He was impeached by Licinius Crassus on a similar charge, and, feeling that he had nothing to hope for from the optimates and that his condemnation was certain, he committed suicide.

See Livy, Epit. 59; Appian, Bell. Civ. i. 18; Vell. Pat. ii. 4; Val. Max. iii. 7; 6; A. H. J. Greenidge, History of Rome (1904).

2. His son, CAIUS PAPRIUS CARBO, surnamed Arvina, was a staunch supporter of the aristocracy, and was put to death by the Marian party in 82. He is known chiefly for the law (Plautia Papiria) carried by him and M. Plautius Silvius when tribunes of the people in 90 (or 89), whereby the Roman franchise was offered to every Italian ally domiciled in Italy at the time when the law was enacted, provided he made application personally within sixty days to the praetor at Rome (see Rome: History, II. "The Republic," Period C). The object of the law was to conciliate the states at war with Rome and to secure the loyalty of the federate states. Like his father, Carbo was an orator of distinction.

See Cicero, Pro Archia, 4; Vell. Pat. ii. 26; Appian, Bell. Civ. i. 88.

3. GNAEUS PAPRIUS CARBO (c. 130–82 B.C.), nephew of (1). He was a strong supporter of the Marian party, and took part in the blockade of Rome (87). In 85 he was chosen by Cinna as his colleague in the consulsip, and extensive preparations were made for occupying on war in Greece against Sulla, who had announced his intention of returning to Italy. Cinna and Carbo declared themselves consuls for the following year, and large bodies of troops were transported across the Adriatic; but when Cinna was murdered by his own soldiers, who refused to engage in civil war, Carbo was obliged to bring them back. In 82 Carbo, then consul for the third time with the younger Marius, fought an indecisive engagement with Sulla near Clusium, but was defeated with great loss in an attack on the camp of Sulla's general, Q. Caecilius Metellus Pius [see under Metellus (6)] near Faventia. Although he still had a large army and the Samnites remained faithful to him, Carbo was so disheartened by his failure to relieve Praeneste, where the younger Marius had taken refuge, that he decided to leave Italy. He first fled to Africa, thence to the island of Cosswra (Pentellaria), where he was arrested, taken in chains before Pompey at Lilybaeum and put to death.

See Sueton, Bell. Civ. i. 61–65; Livy, Epit. 79, 84, 88, 89; Plutarch, Pompey, 5, 6, 10, and Sulla, 28; Cicero, ad Fam. ix. 21; Eutropius, v. 8, 9; Orosius, v. 20; Valerius Maximus, v. 3, 5, ix. 13. 2; art. SULLA, L. CORNELIUS.

CARBOHYDRATE, in chemistry, the generic name for compounds empirically represented by the formula Cn(H2O)m. They are essentially vegetable products, and include the sugars, starches, gums and celluloses (q.v.).

CARBOLIC ACID or Phenol (hydroxy-benzene), C6H5OH, an acid found in the urine of the herbivorae, and in small quantity in castoreum (F. Wöhler, Ann., 1848, 37, p. 360). Its principal commercial source is the fraction of coal-tar which distills between 150 and 200° C., in which it was discovered in 1834 by F. Runge. In 1888, Moissan purified the phenol from this distillate, it is obtained with caustic soda, which dissolves the phenol and its homologues together with a certain quantity of naphthalene and other hydrocarbons. The solution is diluted with water, and the hydrocarbons are thereby precipitated and separated. The solution is then acidified, and the phenols are liberated and form an oily layer on the surface of the acid. This layer is separated, and the phenol recovered by a process of fractional distillation. It may be synthetically prepared by fusing potassium benzene sulphonate with caustic alkalis (A. Kekulé, A. Wurtz); by the action of nitrous acid on aniline; by passing oxygen into boiling benzene containing aluminium chloride (C. Friedel and J. M. Crafts, Ann. Chim. Phys., 1888 (6) 14, p. 433); by heating phenol carboxylic acids with baryta; and, in small quantities by the oxidation of benzene with hydrogen peroxide or nascent ozone (A. R. Leedis, Ber., 1881, 14, p. 976).

It crystallizes in rhombic needles, which melt at 42–54° C., and boil at 182–185° C.; its specific gravity is 1.096 (6° C.). It has a characteristic smell, and a biting taste; it is poisonous, and acts as a powerful antiseptic. It dissolves in water, in parts of water dissolving about one part of phenol at 16-17° C., but it is miscible in all proportions at about 70° C.; it is volatile in steam, and is readily soluble in alcohol, ether, benzene, carbon bisulphide, chloroform and glacial acetic acid. It is also readily soluble in solutions of the caustic alkalis, slightly soluble in aqueous ammonia solution, and almost insoluble in sodium carbonate solution. When exposed in the moist condition to the air it gradually acquires a red colour. With ferric chloride it gives a violet colouration, and with bromine water a white precipitate of tribromphenol.

When phenol is passed through a red-hot tube a complex decomposition takes place, resulting in the formation of benzene, toluidene, naphthalene, etc. (J. G. Kramers, Ann., 1871, 189, p. 239). Chromium oxychloride reacts violently on phenol, producing hydrogen chloride and carbon dioxide, 5 (O(CH3)OH); chronic acid gives phenoquinone, and potassium permanganate gives paradiphenol, oxalic acid, and some salicylic acid (R. Henriques, Ber., 1881, 21, p. 1620). In alkaline solution, potassium permanganate oxidizes it to inactive tartaric acid and carbon dioxide (D. O. Doebner, Ber., 1891, 24, p. 1755).

When distilled over lead oxide, it forms diphenylene oxide, (C6H4)2O; and
when heated with oxalic acid and concentrated sulphuric acid, it forms aurin, C₈H₆O₄S. It condenses with aceto-acetic ester, in the presence of sulphuric acid, to β-methyl coumarin (H. v. Pechmann and J. B. Cohen, Ber., 1884, 17, p. 2188).

The hydrochlorides of phenol can be replaced by metal hydroxides, alkali groups and by acid radicals. The metallic derivatives (phenates, phenate or carbonates) of the alkali metals are obtained by dissolving phenol in a solution of a caustic alkali, in the absence of air. Phenates, C₆H₅ONa, crystallize in a very fine powder on exposure. Other phenates may be obtained from potassium or sodium by precipitation. The alkali derivatives may be obtained by heating phenol with one molecule of a caustic alkali and of an alkali chloride or hydroxide, and the alkali carbonate is obtained as a precipitate.

The anilides of phenol are obtained by condensation of phenol with nitroso compounds; the aniline group having been replaced by the nitroso group. The anilides of phenol are obtained by the action of nitric acid on a cold solution of phenol in concentrated nitric acid. The anilides of phenol are obtained by the action of nitric acid on a cold solution of phenol in concentrated nitric acid.

The phenates of phenol are obtained by dissolving phenol in a solution of a caustic alkali and of an alkali chloride or hydroxide, and the alkali carbonate is obtained as a precipitate.

The nitrophenols are obtained by the action of concentrated nitric acid on phenol, or by the action of concentrated nitric acid on the phenyl esters of phenol. The nitrophenols are obtained by the action of concentrated nitric acid on phenol. The nitrophenols are obtained by the action of concentrated nitric acid on phenol. The nitrophenols are obtained by the action of concentrated nitric acid on phenol. The nitrophenols are obtained by the action of concentrated nitric acid on phenol.
calcite, witherite, calamine and spathic iron ore. In combination with oxygen (as carbon dioxide) it is found to a small extent in the atmosphere. It is a solid substance which occurs in several modifications, differing very much in their physical properties. Amorphous and absorbing gases by the destructive distillation of many carbon compounds, the various kinds differing very greatly as regards physical characters and purity, according to the substance used for their preparation. The most common varieties met with are lampblack, gas carbon, wood charcoal, animal charcoal and coke. Lampblack is prepared by burning tar, resin, tarpentine and other substances rich in carbon, with a limited supply of air; the products of combustion being conducted into condensing chambers in which cloths are suspended, on which the charcoal collects. It is further purified by heating in closed vessels, but even then it still contains a certain amount of mineral matter and more or less hydrocarbons. It is used in the manufacture of printer's ink, in the preparation of black paint and in calico printing. Gas carbon is produced by the destructive distillation of coal in the manufacture of illuminating gas (see GAS: Manufacture), being probably formed by the decomposition of gaseous hydrocarbons. It is a very dense form of carbon, and is a good conductor of heat and electricity. It is used in the manufacture of carbon rods for arc lights, and for the negative element in the Bunsen battery.

Charcoal is a porous form of carbon; several varieties exist. Sugarcloak is obtained by the carbonization of sugar. It is purified by boiling with acids, to remove any mineral matter, and is then ignited for a long time in a current of chlorine in order to remove the last traces of hydrogen. Animal charcoal (bone black) is prepared by burning bones in iron retorts. It is a very impure form of carbon, containing on the average about 80% of calcium phosphate. It possesses a much greater decolorizing and absorbing power than wood charcoal. A variety of animal charcoal is sometimes prepared by calcining fresh blood with potassium carbonate in large cylinders, the mass being purified by boiling out with dilute hydrochloric acid and subsequent reheating. Wood charcoal is a hard and brittle black substance, which retains the external structure of the wood from which it is made. It is prepared (where wood is plentiful) by stacking the wood in heaps, which are covered with earth or with brushwood and turf, and then burning the heap slowly in a limited supply of air. The combustion of the wood is conducted from the top downwards, and from the exterior towards the centre; great care has to be taken that the process is carried out slowly. The disadvantage in this process is that the by-products, such as pyrophosphate, acid, acetic acid, etc., which are found when wood is carbonized in an alternative method, wood is frequently carbonized in ovens or retorts and the volatile products are condensed and utilized.

Charcoal varies considerably in its properties, depending upon the particular variety of wood from which it is prepared, and also upon the process used in its manufacture. It can be made at a temperature as low as 300° C, and is then a soft, very friable material possessing a low power of absorbing gases. Even when made at a temperature of 1000° C it is more dense, and its ignition point is considerably higher. Charcoal burns when heated in air, usually without the formation of flame, although a flame is apparent if the temperature be raised. It is characterized by the power of absorbing gases, and the nature and amount of gases absorbed by charcoal have been shown by J. Hunter [Phil. Mag., 1863 (4), 25, p. 363], one volume of charcoal absorbs (at 8° C and 760 mm. pressure) 117.1 volumes of ammonia, 86.3 volumes of nitrous oxide, 67.7 volumes of carbon monoxide, 21.2 volumes of carbon dioxide, and 6.2 volumes of steam. One volume of charcoal absorbs one volume of hydrogen [see also J. Dewar, Ann. Chem. Phys., 1864 (8), 3, p. 3]. It also has the power of absorbing colouring matters from solution. Charcoal is used as a fuel and as a reducing agent in metallurgical processes.

Element carbon unites directly with hydrogen to form acetylene when an electric arc is passed between carbon poles in an atmosphere of hydrogen (M. Berthelot); it also unites directly with fluorine, producing chiefly, carbon tetrafluoride CF₄. It burns when heated in an atmosphere of oxygen, forming carbon dioxide, and when heated in sulphur vapour it forms carbon bisulphide (g.v.). When heated with nitrogenous substances, in the presence of carbonated or caustic alkali, it forms cyanides. It combines directly with silicon, as in the tetrafluoride of silicon, SiF₄, the temperature of the electric furnace, yielding carbonubundum, SiC; and H. Moissan has also shown that it will combine with many metals at the temperature of the electric furnace, to form carbides (g.v.). The specific heat of carbon varies with the temperature the following values having been obtained by H. F. Weber (Jahresbericht, 1874, p. 63):—

The atomic weight of carbon has been determined by J. B. A. Dumas and by J. S. Stas [Ann. Chim. Phys., 1841 (3), 1, p. 1; Jahresbericht, 1849, 223] by estimating the amount of carbon dioxide formed on putting graphite or diamond in a current of oxygen, the value obtained being 12.0 (o = 16). Confirmatory evidence has also been obtained by O. L. Erdmann and R. F. Marchand [Jour. Prak. Chem., 1841, 23, p. 199; see also F. W. Clarke, Jahresbericht, 1881, p. 7].

Three stripes of carbon are known, namely: carbon suboxide, CO₃, carbon monoxide, CO, and carbon dioxide, CO₂. Carbon suboxide, CO₃, is formed by the action of phosphorus pentoxide on ethyl malonate (O. Diels and B. Wolf, Ber., 1906, 39, p. 689). This suboxide of carbon is a gas, obtaining the following formula (Edin. J., 1891, 88, p. 285). It may be prepared by passing carbon dioxide over red-hot carbon, or red-hot iron; by heating carbonates (magnesite, chalk, &c.) with zinc dust or iron; or by heating many metallic oxidizes with carbon. It may also be obtained from concentrated sulphuric acid (as the oxalic acid, an equal volume of carbon dioxide is produced) and by heating potassium ferrocyanide with a large excess of concentrated sulphuric acid, K₂Fe₄(CN)₆ + 3H₂SO₄ = K₂Fe₄(CN)₆ + 3H₂SO₄ + CO₂ + 3H₂O. It is a colourless, odourless gas of specific gravity 0.967 (air = 1). It is one of the most difficultly liquefiable gases, its critical temperature being −139° 5 C and its critical pressure 55.5 atmos. The liquid boils at −150° C, and is stable at −150° C. [Comptes Rendus, 1880, 91, p. 821; Journal of the Chemical Society, 1891, 34, p. 240.] It is only very slightly soluble in water. It burns with a characteristic pale blue flame to form carbon dioxide. It is very poisonous, uniting with the haemoglobin of the blood to form carbonyl-haemoglobin. It is a powerful reducing agent, especially when in the higher tension of oxygen, when it is absorbed (in ammoniacal or acid (hydrochloric acid) solution of cuprous chloride. It unites directly with chlorine, forming carbonyl chloride or phosphine (see below), and with nickel and iron to form nickel and iron car-
with mineral acids, $\text{MgCO}_3+2\text{HCl}=2\text{MgCl}_2+\text{H}_2\text{O}+\text{CO}_2$. It is also formed in ordinary fermentation processes, in the combustion of all carbon compounds (oil, gas, candles, coal, &c.), and in the process of respiration.

It is a colourless gas, possessing a faint pungent smell and a slightly acid taste. It does not burn, and does not support ordinary combustion, but the alkali metals and magnesium, if strongly heated, will continue to burn in the gas with formation of oxides and lighted magnesium carbonates. 1-2 atmospheres pressure readily condensed, passing into the liquid condition at 0 °C. under a pressure of 35 atmospheres. Its critical temperature is 31-35 °C., and its critical pressure is 72-90 atm. The liquid boils at -78-2 °C. (1 atm.), and by rapid evaporation can be made to solidify to a snow-white solid which melts at -65 °C. (see LIQUID GASES). Carbon dioxide is moderately soluble in water, its coefficient of solubility at 0 °C. being 1:7977 (R. Bunsen). It is still more soluble in alcohol. The dissolved gas in the water is usually supposed to contain *carbonic acid*, $\text{H}_2\text{CO}_3$. The gas is rapidly absorbed by solutions of the caustic alkalis, with the production of alkaline carbonates (g.s.), and it combines readily with potassium hydroxide to form potassium carbonate, with the liberation of carbonic acid-

to form ammonium carbonate, $\text{NH}_3\text{COONa}$. It may be readily recognized by the white precipitate which it forms when passed through lime or baryta water. Carbon dioxide dissolves in water, which swells and, if dried, then decomposes, being a balanced action; the extent of the action for varying temperatures and pressures has been calculated by H. Le Chatelier (Z. phys. Chem., 1888, 2, p. 782; see H. Sainte-Claire Deville, Comptes rendus, 1856, 42, 188).

Carbon dioxide is determined by burning carbon in oxygen, when it is found that the volume of carbon dioxide formed is the same as that of the oxygen required for its production, hence carbon dioxide corresponds to the volume of carbon or oxygen in the compound. It is used in the industrial application in the preparation of soda by the Solvay process, in the sugar manufacture, in the manufacture of mineral waters, and in the artificial production of ice.

**Carbonosity** (Resende), CO<sub>2</sub>, was first obtained by John Davy (Phil. Trans., 1812, 40, p. 220). It may be prepared by the direct action of carbon monoxide and chlorine in sunlight (Th. Wilm and G. Wieschin, Ann., 1868, 14, p. 150): by the action of phosphorus pentoxide on carbon tetrachloride at 200-210 °C. (G. Gustavson, Ber., 1872, 5, p. 37); 4Cl<sub>2</sub>Cl<sub>2</sub>+PO<sub>4</sub>=2Cl<sub>2</sub>PO<sub>4</sub>+2POCl<sub>3</sub>; by the oxidation of chloroform with chromic acid mixture (A. Emminger and B. Lengyel, Ber., 1869, 2, p. 54); 4ClCH<sub>3</sub>Cl+SO<sub>2</sub>=4Cl<sub>2</sub>Cl<sub>2</sub>SO<sub>2</sub>; or more conveniently by heating carbon tetraiodide in a sealed tube, under pressure of sulphuric acid (H. Erdmann, Ber., 1865, 26, p. 1993). 2SO<sub>2</sub>Cl<sub>2</sub>Cl<sub>2</sub>=SOCl<sub>2</sub>+Cl<sub>2</sub>COCl<sub>2</sub>.</p>

It is a colourless gas, possessing an unpleasant pungent smell. Its vapour density is 3.46 (air = 1). It may be condensed to a liquid, which, by heating, is then again decomposed and is a colourless gas, and in many hydrocarbons. Water decomposes it violently, with formation of carbon dioxide and hydrochloric acid. It reacts with alcohol to form chloroformic ester and ultimately diethyl carbonate, and to form the same products with alcohols, and with the hydrochloric acid. It is employed commercially in the production of colouring matters (see BENZOPIENONE), and for various synthetic processes.

**Carbonous oxide**, COS, was first prepared by C. Than in 1867 (Ann.). It may be passed over carbon monoxide gas and a tube at a moderate heat. It is also formed by the action of sulphuretted hydrogen on the isocyanic esters, 2CONH<sub>2</sub>H<sub>2</sub>S=CO+CO(NH)<sub>2</sub>H<sub>2</sub>S, by the action of concentrated hydrochloric acid on the isocyanic esters, or in the distillation of potassium bisulphide at 200-210 °C., or from the action of hydrogen sulphide on the caustic alkalis, concentrated sulphuric acid, and by the decomposition of ethyl potassium thiocarbonate with hydrochloric acid, CO(OH)<sub>2</sub>SK+HCl=CO=KCl+C<sub>2</sub>H<sub>5</sub>OH. It is a colourless, odourless gas, which burns with a violet flame, and is a colourless gas, but it is condensable into a liquid at a temperature of 210 °C., and is a colourless gas. The density of the gas is 2.1406 (air = 1). The liquefied gas boils at -47 °C. under atmospheric pressure. It is soluble in water; the aqueous solution gradually decomposes on standing, forming carbon dioxide and sulphuric acid. It is used in the manufacture of carbonic acid for analytical purposes, and in the manufacture of carbonates, provided they are not too concentrated, forming solutions of alkali carbonates and sulphides, COS+4KOH=K<sub>2</sub>CO<sub>3</sub>+K<sub>2</sub>S+2H<sub>2</sub>O.

**CARBONADO** or **Carbonari**. A name given in Brazil to a dark massive form of impure diamond, known also as "carbonate" and in trade simply as carbon. It is sometimes called black diamond. Generally it is found in small masses of irregular polyhedral form, black, brown or dark-grey in colour, with a dull resinoid lustre; and with a granular fracture, paler in colour, and in some cases much resembling that of fine-grained steel. Being slightly darker, its specific gravity is rather less than that of crystallized diamond. It is found almost exclusively in the state of Bahia, in Brazil, where it occurs in the "cascalho" or diamond-bearing gravel. Borneo also yields it in small quantity. Formerly of little if any value, it came into use on the introduction of Leschet's diamond-drills, and is now extremely valuable for mounting in the steel crowns used for diamond-boring. Having no cleavage, the carbon is less liable to fracture on the part of the drill than is crystallized diamond. The largest piece of carbonado ever recorded was found in Bahia in 1895, and weighed 3150 carats. Pieces of large size are, however, relatively less valuable than those of moderate dimensions, since they require the expenditure of much labour in reducing them to fragments of a suitable size for mounting in the drills. Imitation has sometimes been mistaken in the South African mines for carbonado.

**Carbonaro** (an Italian word meaning "charcoal-burners"), the name of certain secret societies of a revolutionary tendency which played an active part in the history of Italy and France early in the 19th century. Societies of a similar nature had existed in other countries and epochs, but the method of the derivation of the Carbonaro from mysterious brotherhoods of the middle ages are purely fantastic. The Carbonaro were probably an offshoot of the Freemasons, from whom they differed in important particulars, and first began to assume importance in southern Italy during the Napoleonic wars. In the reign (1808-1815) of Joachim Murat a number of secret societies arose in various parts of the country with the object of freeing it from foreign rule and obtaining constitutional liberties; they were ready to support the Neapolitan Bourbons or Murat, if either had fulfilled these aspirations. Their watchwords were freedom and independence, but they were not agreed as to particular form of government to be afterwards established. Murat's minister of police was a certain Malghella (a Genoese), who favoured the Carbonaro movement, and was indeed the instigator of all that was Italian in the king's policy. Murat himself had protected the sectarians, especially when he was quarrelling with Napoleon, but later, Lord William Bentinck entered into negotiations with them from Sicily, where he represented Great Britain, through their leader Vinzenzo Federici (known as Capobianco), holding out promises of a constitution for Naples similar to that which had been established in Sicily under British auspices in 1812. Some Carbonaro disorders having broken out in Calabria, Murat sent General Manfè against the rebels; the movement was ruthlessly quelled and Capobianco hanged in September 1813 (see Greco, _Intorno al tentativo dei Carbonari di Citeriore Calabria nel 1813_). But Malghella continued secretly to protect the Carbonaro and even to organize them, so that on the return of the Bourbons in 1815 King Ferdinand IV. found his kingdom swarming with them. The society comprised nobles, officers of the army, small landowners, government officials, peasants and even priests. Its organization was both curious and mysterious, and it had a fantastic ritual, full of symbols taken from the Christian Church as from the Freemasons, which was extensively practiced in the mountains of the Abruzzi and Calabria. A lodge was called a _vendita_ (sale), members saluted each other as _buoni cugini_ (good cousins), God was the "Grand Master of the Universe," Christ the "Honorary Grand Master," also known as "the Lamb," and every Carbonaro was pledged to deliver the Lamb from the Wolf, _i.e._ tyranny. Its red, blue and black flag was the standard of revolution in Italy until substituted by the red, white and green in 1831.

When King Ferdinand felt himself securely re-established at Naples he determined to exterminate the Carbonari, and to this end his minister of police, the prince of Canosa, set up another secret society called the _Calderari del Contrappeso_ (braziers of the counterpoise), recruited from the brigands and the dregs of the people, who committed hideous excesses against Liberals, but failed to exterminate the movement. On the
contrary, Carbonari flourished and spread to other parts of Italy, and countless lodges sprang up, their adherents comprising persons in all ranks of society, including, it is said, some of royal blood, who had patriotic sentiments and desired to see Italy free from foreigners. In Romagna the movement was taken up with enthusiasm, but it also led to a certain number of murders owing to the fiery character of the Romagnols, although its criminal record is on the whole a very small one. Among the foreigners who joined it for love of Italy was Lord Byron. The first rising actively promoted by the Carbonari was the Neapolitan revolution of 1820. Several regiments were composed entirely of persons affiliated to the society, and on the 1st of July a military mutiny broke out at Monteforte, led by two officers named Morelli and Silvati, to the cry of "God, the King and the Constitution." The troops sent against them, under General Pepe, himself a Carbonaro, sympathized with the mutineers, and the king, being powerless to resist, granted the constitution (15th of July), which he swore on the altar to observe. But the Carbonari were unable to carry on the government, and after the separatist revolt of Sicily had broken out the king went to the congress of Lainebach, and obtained from the emperor of Austria the loan of an army with which to restore the autocracy. He returned to Naples early in 1821 with 31,000 Austrians, defeated the constitutionalists under Pepe, dismissed parliament, and set to work to persecute all who had been in any way connected with the movement.

A similar movement broke out in Piedmont in March 1821. Here as in Naples the Carbonari comprised many men of rank, such as Santorre di Santarossa, Count San Marzano, Giacinto di Collegno, and Count Moffa di Lisio, all officers in the army, and they were more or less encouraged by Charles Albert, the heir-presumptive to the throne. The rising was crushed, and a number of the leaders were condemned to death or long terms of imprisonment, but most of them escaped. At Milan there was only the vaguest attempt at conspiracy; but Silvano Pellico, Maroncelli and Count Codorni were afterward suspected of having invited the Piedmontese to invade Lombardy, and were condemned to pass many years in the dungeons of the Spielberg.

The French revolution of 1830 had its echo in Italy, and Carbonarism raised its head in Parma, Modena and Romagna the following year. In the papal states a society called the Sandefidi or Bande della Santa Fede had been formed to check the Carbonari, and their behaviour and character resembled those of the Calderai of Naples. In 1831 Romagna and the Marches rose in rebellion and shook off the papal yoke with astonishing ease. At Parma the duchess, having rejected the demand for a constitution, left the city and returned under Austrian protection. At Modena, Duke Francis IV., the worst of all Italian tyrants, was expelled by a Carbonarist rising, and a dictatorship was established under Biagio Nardi on the 5th of February. Francis returned with an Austrian force and hanged the conspirators, including Di Memojetti. The Austrians occupied Romagna and restored the province to the pope, but the attempts of the Austrians were not successful. The secret orders of Carbonari were made there no executions. Among those implicated in the Carbonarist movement was Louis Napoleon, who even in after-years, when he was ruling France as Napoleon III., never quite forgot that he had once been a conspirator, a fact which influenced his Italian policy. The Austrians retired from Romagna and the Marches in July 1831, but Carbonarism and anarchy having broken out again, they returned, while the French occupied Ancona. The Carbonari after these events ceased to have much importance, their place being taken by the more energetic Giovanni Italia Society presided over by Mazzini.

In France, Carbonarism began to take root about 1820, and was more thoroughly organized than in Italy. The example of the Spanish and Italian revolutions inspired the French Carbonari, and risings occurred at Bellot, Thouars, La Rochelle and other towns in 1821, which though easily quelled revealed the nature and organization of the movement. The Carbonarist lodges proved active centres of discontent until 1830, when, after

contributing to the July revolution of that year, most of their members adhered to Louis Philippe's government.

The Carbonarist movement undoubtedly played an important part in the Italian Risorgimento, and if it did not actively contribute to the wars and revolutions of 1848-49, 1859-60 and 1866, it prepared the way for those events. One of its chief merits was that it brought Italians of different classes and provinces together, and taught them to work in harmony for the overthrow of tyranny and foreign rule.

BIBLIOGRAPHY.—Much information on the Carbonari will be found in R. M. Johnston's Neapolitaine Empire in Southern Italy (2 vols., London, 1904), which contains a full bibliography; D. Spencer, "Carbonarism in Northern Italy," Trans. Brit. Arch. Inst. (1891); H. Fiume, "Memorie storiche e storicho della storia e dell'ecoiana del mondo," (Turin, 1868-70); P. Spadoni, "The secret societies of Italy," London, 1868; and other excellent monographs; Memoirs of the Secret Societies of Southern Italy, said to be by one Bertoldi or Bartholy (London, 1821, transl. by A. M. Cavallorri, Rome, 1904); Saint-Edme, Constitution of organisations by heating Gas; P. C. C. Colletta, "Storia dei Re Mane di Napoli" (1848); B. King, A History of Italian Unity (London, 1899), with bibliography.

(L. V. *)

CARBONATES. (1) The metallic carbonates are the salts of carbonic acid, H2CO3. Many are found as minerals, the more important of such naturally occurring carbonates being serpussile (lead carbonate, PbCO3), malachite and azurite (both basic copper carbonates), calamine (zinc carbonate, ZnCO3), witterite (barium carbonate, BaCO3), strontianite (strontium carbonate, SrCO3), calcite (calcium carbonate, CaCO3), dolomite (calcium magnesium carbonate, CaCO3:MgCO3), and sodium carbonate, Na2CO3. Most metals form carbonates (aluminium and chromium are exceptions), the alkalil metals yielding both acid and normal carbonates of the types M(HCO2)2 and MCO3(M=one atom of a monovalent metal); whilst bismuth, copper and magnesium appear only to form basic carbonates. The acid carbonates of the alkalil metals can be prepared by saturating an aqueous solution of the alkaline hydroxide with carbon dioxide, M(OH)2 + CO2 = M(HCO2)2, and from these acid salts the normal salts may be obtained by gentle heating, carbon dioxide and water being produced at the same time, 2M(HCO2)2 = M2CO3:CO2 + CO2. Most other carbonates are formed by precipitation of salts of the metals by means of alkaline carbonates. All carbonates, except those of the alkalil metals and of thallium, are insoluble in water; and the majority decompose when heated strongly, carbon dioxide being liberated and a residue of an oxide of the metal left. The alkaline carbonates undergo only a very slight decomposition, even at temperatures very bright red heat. The carbonates are decomposed by mineral acids, with formation of the corresponding salt of the acid, and liberation of carbon dioxide. Many carbonates which are insoluble in water dissolve in water containing carbon dioxide. The individual carbonates are described under the various metals.

(2) The organic carbonates are the esters of carboxylic acid, H2CO3, and of the unknown ortho-carboxylic acid, C(OH)2. The acid esters of carboxylic acid of the type HO-CO-OR are not known in the free state, but J. B. Dumas obtained barium methyl carbonate by the action of carbon dioxide on baryta dissolved in methyl alcohol (Ann., 1840, 35, p. 283).

Potassium ethyl carbonate, KO-CO-OC2H5, is obtained in the form of a white mass of crystals by the action of ethyl chloride on potassium carbonate, KO-CO-OC2H5 + 2H2O = KOH + CO2 + 2C2H5OH. It is not very stable, water decomposing it into alcohol and the alkaline carbonate. The normal esters may be prepared by the action of alcohol on the alkali hydroxides or by the action of alcohols on the alkali carbonates. The alkali carbonate, CO3,2-, is a colourless liquid, which boils at 96° C., and is prepared by heating the methyl ester of chloroformic acid with lead oxide, chloroformic ester, CO2 + 2COC12 = 2COCl2 + CO2. The carbonic ester, CO2 + 2C2H5OH = C2H5OCO2C2H5 + 2H2O, will not boil at 150° C., but will decompose into ethyl ether and a carboxylic acid (A. Geuthcr, Zeit. f. Chemie, 1866).

Ortho-carboxylic ester, C(OH)2C2H5, is formed by the action of sodium ethylate on chloropicrin (H. Bassett, Ann., 1862, 17, p. 54), C6H5NO2 + 2CH32ONa = C6H5OCO2Na + Na2CO3 + 2H2O. It is a colourless liquid, which boils at 150°-159° C., and has a specific
CARBON BISULPHIDE—CARBONIFEROUS SYSTEM

graviy of 0.925. When heated with ammonia it yields guanidine, and on boiling with alcoholic potash it yields potassium carbonate.

Chlorobenzoic ester, CI-COCOCH₃, is formed by the addition of well-cooled absolute alcohol to phosgene (carbonyl chloride). It is a pungent-smelling liquid which fumes strongly on exposure to air. It boils at 93-8°C, and has a specific gravity of 1.144 (15°C). When heated with ammonia it yields urethane. Sodium amalgam converts it into formic acid, whilst with alcohol it yields the normal carbonic ester. It is broken down by many substances (water, carbonic acid, zinc chloride, &c.) into ethyl chloride and carbon dioxide.

Percarbonates.—Barium percarbonate, BaCO₃, is obtained by passing an excess of carbon dioxide into water containing barium sulphate suspended in it. Perchlorates and yeilds of potassium peroxide when treated with acids. (E. Merck, ‘Abs. J.C.S.’, 1902, ii. p. 839.) Sodium percarbonates of the formulae Na₂CO₃, Na₂CO₃, Na₂CO₃, Na₂CO₃ (two isomers) are obtained by the action of gaseous or solid carbon dioxide on the peroxide of sodium or the peroxide of sodium and carbonic acid of less boiling point in the presence of water and a metallic chlorides, at a low temperature (R. Wolfenstein and E. Peltzer, ‘Ber.’, 1903, 41, pp. 277, 280.) Potassium percarbonate, K₂CO₃, is obtained in the electrolysis of potassium carbonate at —10 to 15°C.

CARBON BISULPHIDE, CS₂, a chemical product first discovered in 1796 by W. A. Lampschur, who obtained it by heating a mixture of charcoal and pyrites. It may be more conveniently obtained by passing the vapour of sulphur over red hot charcoal, the condensed gases so produced being led into a tower containing plates over which a vegetable oil is allowed to flow in order to absorb any carbon bisulphide vapour, and then into a second tower containing lime, which absorbs any sulphurised hydrogen.

The crude product is very impure and possesses an offensive smell; it may be purified by forcing a fine spray of lime water through the liquid until the escaping water is quite clear, the washed bisulphide being then mixed with a colourless oil and distilled at a low temperature. For further methods of purification see J. Singer (‘Journ. of Soc. Chem. Ind.’, 1889, p. 93.) Th. Sidiot (‘Jahresb.’, 1886, p. 243.) E. Allary (‘Journ. de la Soc. Chim.’, 1881, 35, p. 491.) E. Obach (‘Journ. prak. Chem.’, 1882 (2), p. 275, 282.)

When perfectly pure, carbon bisulphide is a colourless, somewhat unpleasant smelling, highly refractive liquid, of specific gravity 1.2661 (15°/°C.) (W. Brühl) or 1.29215 (20°/°C.) (T. E. Thorpe.) It boils at 46.04° C. (T. E. Thorpe, ‘Journ. Chem. Soc.’, 1880, 37, p. 364.) Its critical temperature is 277° 7° C., and its critical pressure is 78.51 atmos. (J. Dwarw, ‘Chem. News’, 1885, 51, p. 27.) It solidifies at about —115° C, and liquefies again at about —110° C. (K. Olszewski, ‘Jahresb.’, 1883, 7, p. 75.) It is a monomolecular liquid (W. Ramsay and J. Shield, ‘Journ. Chem. Soc.’, 1893, 63, p. 1089.) It is very volatile, the vapour being heavy and very inflammable. It burns with a pale blue flame to form carbon dioxide and sulphur dioxide. It is almost insoluble in water, but mixes in all proportions with absolute alcohol, ether, benzene and various oils. It is a good solvent for sulphur, phosphorus, wax, iodine, &c. It dissociates when heated to a sufficiently high temperature. A mixture of carbon bisulphide vapour and nitric oxide burns with a very intense blue-coloured flame, which is very rich in the violet and azure rays. When heated with water in a sealed tube it yields carbon dioxide and sulphurised hydrogen. Zinc and hydrochloric acid reduce it to tri-thioformaldehyde (CH₂S₃) (A. Girard, ‘Comptes rendus’, 1856, 43, p. 39.) When passed through a red-hot tube with chlorine it yields carbon tetrachloride and sulphur chloride (H. Kolbe). Potassium, when heated, burns in the vapour of carbon bisulphide, forming potassium sulphide and liberating carbon. In contact with chlorine monoxide it forms carbonyl chloride and thionyl chloride (P. Schützeneberger, ‘Ber.’, 1896, 2, p. 219.) When passed with carbon dioxide through a red-hot tube it yields carbon oxysulphide, COS (C. Winkler), and when passed over sodamide it yields ammonium thiocyanate. A mixture of carbon bisulphide vapour and sulphured hydrogen, when passed over heated copper, gives, amongst other products, some methane.

Carbon bisulphide slowly oxidizes on exposure to air, but by the action of potassium permanganate or chromic acid it is readily oxidized to carbon dioxide and sulphuric acid. By the action of aqueous alkalis, carbon bisulphide is converted into a mixture of an alkaline carbonate and an alkaline thiocarbonate (J. Berzelius, ‘Pogg. Ann.,’ 1826, 5, p. 44.) 6KHO+4CS₂=K₂CO₃+2KC₂S₂+3H₂O; on the other hand, an alkaline solution of a caustic alkali converts it into a xanthate (A. Vogel, ‘Jahresb.’, 1853, p. 643.)

CS₂+KHO+R-OH=H₂O+RO-CS-SK.

Aqueous and alcoholic solutions of ammonia convert carbon bisulphide into ammonium dichromate, which readily breaks down into ammonium thiocyanate and—sulphured hydrogen (A. W. Hofmann).

CS₂+2NH₂→NH₄CSS-NH₂→H₂S+NH₄CNS.

Carbon bisulphide combines with primary amines to form alkyl amides, which are decomposed by hot sulphuric acid and leave a residue of a diallyl thiourea.

CS₂+2R-NH₂→R-NH₂CSS-NH₂→CS(NH₂)₃+H₂S; or if the aqueous solution of the dichromate be boiled with mercuric chloride or silver nitrate solution, a mustard oil (q.v.) is formed.

R-NH₂CSS-NH₂+HgCl₂→Hg(NH₂CSS-NH₂)+2RNC≡HC≡HC≡H₂S.

Carbon bisulphide is used as a solvent for caoutchouc, for extracting essential oils, as a germicide, and as an insecticide.

Carbon monosulphide, CS, is formed when a silent electric discharge is passed through a mixture of carbon bisulphide, carbon dioxide, or carbon monoxide (S. M. Losanitsch and M. Z. Jovitschitsch, ‘Ber.’, 1897, 39, p. 135.)

CARBONDALE, a city of Lackawanna county, Pennsylvania, U.S.A., on the Lackawanna river, 16 m. N.E. of Scranton. (Pop. 1890) 10,833; (1900) 13,356, of whom 2553 were foreign-born; (1910 census) 17,040. Carbondale is served by the Erie, the Delaware & Hudson (which has machine shops here), and the New York, Ontario & Western railways. The city lies near the upper end of the Lackawanna valley, and the scenery of the surrounding mountains makes it a summer resort of some importance. It has a public library, a small park, an emergency hospital and the Carbondale city private hospital. Carbondale is situated in one of the richest anthracite coal regions of the state, and its principal interest is in coal. Among its manufactures are foundry and machine shop products, sheet-iron, silk, glass thermometers and hydrometers, bobbins and reeling machines, &c.

The value of the coal products increased from $1,146,181 in 1900 to $2,313,050 in 1905, or 102%. The settlement of the place began in 1824 with the opening of the coal mines, and Carbondale was charted as a city in 1851.

CARBONIC ACID, in chemistry, properly H₂CO₃, the acid assumed to be formed when carbon dioxide is dissolved in water; its salts are termed carbonates. The name is also given to the neutral carbon dioxide from its power of forming salts with oxides, and on account of the acid nature of its solution; and, although not systematic, this use is very common.

CARBONIFEROUS SYSTEM, in geology, the whole of the great series of stratified rocks and associated volcanic rocks which occur above the Devonian or Old Red Sandstone and below the Permian or Triassic systems, belonging to the Carboniferous period. The name was first applied by W. D. Conybeare in 1824 to the coal-bearing strata of England and Wales, including the related grits and limestones immediately beneath them. The term is a relic of that early period in the history of stratigraphy when each group of strata was supposed to be distinguished by some peculiar lithological character. In this case the carbonaceous beds—coal-seams—naturally appealed most strongly to the imagination, and the name is a good one, notwithstanding the fact that coal-seams occupy but a small fraction of the total thickness of the Carboniferous system; and although subsequent investigations have demonstrated the existence of coal in other geological formations, in none of these does it play so prominent a part. The stratified rocks of this system include marine limestones, shales and sandstones; estuarine, lagoonal and fresh-water shales, sandstones and marls with beds of coal, oil-bearing rocks, gypsum and salt.

In many parts of the world there is no sharp line of demarcation between the Devonian and the Carboniferous rocks; neither can the fossil faunas and floras be clearly stigmatized by any well-defined line; this is true in Britain, Belgium, Russia, Westphalia and parts of North America. Again, at the summit of the Carboniferous series, both the rocks and their fossil contents merge gradually into those of the succeeding Permian
There seems to be sufficient reason, however, to maintain each of these groups as a separate system and limit the term Carboniferous (carboniferi) in the manner indicated above. At the same time it must be remembered that there is in India, South Africa, the Urals, in Australasia and parts of North America an important series of rocks, with a "Perno-Carboniferous" fauna, which constitutes a passage formation between the Carboniferous, sensu stricto, and Jurassic rocks.

Stratigraphy.—No assemblage of stratified rocks has received such careful and detailed examination as the Carboniferous system; consequently our knowledge of the stratigraphical sequence in isolated local areas, where the coals have been exploited, is very full. In Europe, the system is very completely developed in the British Isles, where was made the first successful attempt at a classification of its various members, although at a somewhat earlier date Omalus d'Halloy had recognized a terrains brunniferes or coal-bearing series in the Belgian region.

The area within which the Carboniferous rocks of Britain occur is sufficiently extensive to contain more than one type of the system, and thus to cast much light on the varied geological conditions under which these rocks were accumulated. In prosecuting the study of this part of British geology it is soon discovered, and it is essential to bear in mind, that, during the Carboniferous period, the land surfaces the chief supplies of sediment were derived from mainly to the north and north-west, as it seems to have done from very early geological time. While therefore the centre and south of England lay under clear water of moderate depth, the north of the country and the south of Scotland were covered by shallow water, which was composed of debris and marls from the adjacent northern land. Hence vertical sections of the Carboniferous formations of Britain differ greatly according to the districts in which they are taken.

The Coal-Measures and Millstone Grit are usually grouped together in the Upper Carboniferous, the Carboniferous Limestone series constituting the Lower Carboniferous.

In addition to the above subdivisions, Murchison and Sedgwick, when working upon the rocks of Devonshire and Cornwall, recognized, with the assistance of W. Lonsdale, another phase of sedimentation. This comprised dark shales, with grits and thin limestones and thin, impure coals, locally called "culm" (g.v.). These geologists appropriated the term "culm" to the whole of this facies in the west of England, and subsequently traced the same type on the European continent, where it is widely developed in the western centre.

Beyond the considerable exposed area of Carboniferous rocks in Great Britain, there is as much or more that is covered by younger formations; this is true particularly of the eastern side of England and the south-eastern counties, where the coal-measures have already been found at Dover.

From England, Carboniferous rocks can be followed across northern and central France, into Germany, Bohemia, the Alps, Italy and Spain. In Russia this system occupies some 30,000 sq. m., and it extends northward at least as far as Spitzbergen. Carboniferous rocks are present in North and South America, and in India and Australasia; in China they cover thousands of square miles, and in the United States and British North America they occupy no less than 200,000 sq. m.; they are known also in South America.

The subjoined table expresses the typical subdivisions which can be recognized, with modifications, in the United Kingdom.

The thick, main or scurf limestone (mountain limestone) of the centre and south of England, Wales and Ireland, which splits up in the Yorkshire dales (Yoredale group) into a succession of stout limestone beds, becomes increasingly deltrital in character as it is traced northwards.

While the continental type of deposit, with its coal beds, was the earliest to be formed in certain areas, and the marine series came later, in other regions this order was reversed. It should be observed, however, that the repeated intercalation of marine deposits within the continental series and the frequent occurrence of thin coaly layers in the British trying to be so restricted to the upper or younger division, and, as E. Kayser points out, the real state of the matter is more accurately represented by the subjoined tabular scheme.

the Millstone Grit contains fragments of chert which can only have come from the waste of the earlier limestones. This unconformity is generally found at the same horizon in the continental Culm areas, and it occurs again in the western part of the English Culm.

In the eastern border of the Rhenish Schiefergebirge the Schieferruste unconformably rests upon Lower Carboniferous rocks.

United States. In Missouri, Pennsylvania, West Virginia, Kentucky, Ohio and elsewhere is a pronounced unconformity between the Lower and Upper Carboniferous. So great that during which the lower member was strongly eroded; it has even been proposed to regard the Mississippian (Lower Carboniferous) as a distinct geological period, mainly on account of this break in the succession.

Thickness of Carboniferous Rocks. The variety of conditions under which the sediments and limestones were formed naturally produced inequalities in the thickness of the rocks. In the European countries the greatest thickness of Carboniferous rocks is in the west; in North America it is in the east. In Britain the Carboniferous limestone series is 2000-3500 ft. thick; in the Ural mountains it is over 4350 ft.; the Culm in Moravia is credited with the enormous thickness of 36000 ft. The Upper Carboniferous in Lancashire is from 12,000 to 13,000 ft.; elsewhere in Britain it is thinner. In western Germany this portion attains a thickness of 10,000 ft. In Pennsylvania the sandstone and shale, at its maximum, reaches 3000 ft., but even within the limits of the state this formation has thinned out to no more than 300 ft. in places. In Colorado the Lower Carboniferous is only 400-500 ft. thick; while the limestones of the Mississippi basin amount to 1500 ft. and in Virginia are 2000 ft. thick.

Life of the Carboniferous Period. We have seen in the Carboniferous rocks there are two phases of sedimentation, the one marine, the other continental; corresponding with these there are two great immigrations of plants.

1. Fauna of the Marine Strata.—Numerically the most important inhabitants of the clear Carboniferous seas were the crinoids, corals, foraminifera and brachiopods. Each of these groups contributed at one time or another to the overwhelming of great thicknesses of limestone. For the first time in the earth's history were celebrated Foraminifera taking a prominent part in the marine fauna; the genus Fusulina was abundant in what is now Russia, China, Japan, North America; Valvulina had a wide range, as also had Endothyra and Archaeocystis; Sacculina was seen in Britain, Belgium, and many others have been described; some Carboniferous genera are still extant. Radiolarians are found in the Culm of Devonshire and Cornwall, in Russia, Germany and elsewhere. Spores are represented by the initials of certain crustaceans, and the offshoots of this geographical phase include Anthracocystis, which is supposed to have lived in brackish or fresh water, such as Anthracocystis, Naiadites, Carbonoides, and many forms of Crustacea, e.g. (Bairdia Carbonis), byphyllopsis, Anoxocrinum, atherides, Anthracocystis, Eurypterids (Eurypteris, Glyptopterus, Glyptopteris). Fishes were abundant, many of the smaller genera are beautifully preserved in an entire condition, other large forms are represented by a few isolated bones; Ctenodus, a remarkable shark, Lingula, and others.

Annelida (Siporobios, Serpulites, &c.) are common fossils on certain horizons. The Bryozoa were also abundant in some regions (Polygona, Pectinata), including the remarkable form known as Archimedes.

Brachiopods occupied an important place; most typical were the Productids, some of which reached a great size and had very thick shells. Other common genera were Spirifer, Che nues, Athys, Rhynchonellids and Terebratulids, Discina and Crania. Some species had an almost world-wide range with only minor variations; such are Productus semireticulatus, Pora, P. postulata, Orthis (Streptorhyncha) crenistria, Didyma hastata, and many others.

Pelecypods among the true mollusca were increasing in numbers and importance; Alveoidea, Lingula, Terebratula and Terebratalia, Cordo- edna, Edinodonta, Consideria, Molitia, Gasteropods also were numerous (Murchisonia, Eupomphila, Naticopsis). The Pteropods were well represented by Consularia and Bellerophon. Amongst the Cephalopods, the most striking feature was the rise of the ammonite, or cephalopods, so prominent during the Devonian period, disappeared before the close of the Carboniferous. Most of the shells lived in the sea continuously, but the gastropods frequented the coastal waters and were common in the inland. At this point the Carboniferous system of fish have been described largely from teeth, spines and dermal ossicles.

2. Flora and Fauna of the Lagoonal or Continental Facies.—The strata in this region are often the richest in which the remains of plants take a prominent place. The fossil plants which are found in the upper beds of the preceding Devonian system are so closely related to those in the Lower Carboniferous, that from a palaeobotanical standpoint the two forms form one indivisible period.

In the Lower Carboniferous the flora was composed of six great groups of plants. In the Equisetales (Horse-tails), the Lycopodiales (Lycopods), the Sphenophyllales (Sphenophyllum), and the Cordaitales. These six groups were the dominant types throughout the period, but during Upper Carboniferous time three of these groups arose, the Coniferales, the Cycadophyta and the Glossopteridales, which were to become the modern representatives of the flora. Algae and fungi also were present, but they were not represented in the Carboniferous period. The true ferns, including tree ferns with a height of upwards of 60 ft., were associated with many plants possessing a fern-like habit but with no spores or the structure of the fern. Many of these forms have not yet been definitely determined. The fronds of many of these groups are almost identical with those of living species. Probably many of the ferns were epiphytic, Pecopteris, Cyclopteris, Neuropteris, Aethopteris, Sphenopteris and common genera Megaphylon and Cyclopteris were represented. For instance the horse-tails, with scaly leaves were represented in the Carboniferous period by gigant amalagales, often with a diameter of 1 to 2 ft. and a height of 3 to 30 ft. These Carboniferous forerunners of the tiny club-moss were then great trees, with prominent cones and crowded linear leaves, such as Lepidodendron (with its fruit cone called Lepidostrobus), Halia, Lepidophloios and Sigillaria, the largest plants of the period, with trunks sometimes 6 ft. in diameter and 30 ft. in height. The most prominent of these was known as Sigillaria. Sphenophyllum was a slender climbing plant with whorls of leaves, which was probably related both to the calamites and the lycopods. Cordaites, a tall plant (20-30 ft.) with yucca-like leaves, was related to the cycads and conifers, the duck-bill leaves, which bore yew-like berries, is called Cardiocarpus. Many large trees which have been looked upon as conifers on account of their wood structure may perhaps belong more properly to the Calamites. True coniferous trees (Wachia) do appear at the top of the coal measures.

The animals preserved in the continental type of Carboniferous deposit naturally differ from the fossils of the purely marine period. One of the most characteristic forms of this geographical phase include Anthracocystis, which is supposed to have lived in brackish or fresh water, such as Anthracocystis, Naiadites, Carbonoides, and many forms of Crustacea, e.g. (Bairdia Carbonis), byphyllopsis, Anoxocrinum, atherides, Anthracocystis, Eurypterids (Eurypteris, Glyptopterus, Glyptopteris). Fishes were abundant, many of the smaller genera are beautifully preserved in an entire condition, other large forms are represented by a few isolated bones; Ctenodus, a remarkable shark, Lingula, and others.

Remains of air-breathing insects, myriapods and arachnids show that these forms of life were both well developed and individually numerous. Among the insects we find the Orthoptera, Neuroptera, Insects, and annelids, represented; cockroaches were particularly abundant; crickets, beetles, locusts, walking-stick insects, mayflies and bugs were found, but there were neither flies, moths, butterflies nor bees, which is no more than we should expect from
The conditions of plant life. Many insects, &c., have been obtained from the coalfields of Saarbrücken and Commercy, and from the hollow trunks of fossil trees in Nova Scotia. Certain British coalfields have yielded good specimens: Archaeopteryx, from the Derbyshire coal-measures of England; and the small, slender and quite perfect pterodactyls (Broda) still exhibit traces of brilliant wing colours. In the Nova Scotian tree trunks land snails (Achaeostaurites, Dendropop) have been found.

Carboniferous rocks. The earliest amphibians make their appearance in considerable numbers; they were all Stegocephalians (Labyrinthodonts) with long bodies, a head covered with bony plates and weak or undeveloped limbs. The largest were about 7 or 8 ft. long, and several inch-thick pterodactyls (Lacoma, Anachthocerus, Ophiderion); others may have been terrestrial (Dendropteryx, Hyphopteryx). Certain footprints in the coal measures of Kansas have been supposed to represent leaelacertian or dinosaurs of the time.

The Physical Changes during the Period. In western Europe, the advent of the Carboniferous period was accompanied by the production of a series of synclines which permitted the formation of organic limestone, free from the sediments which generally characterize the older and younger formations. The Old Red Sandstone and other deposits were thus reduced to a thickness of from 50 to 100 yds.

The old land area still existed to the north, but doubtless much reduced in height; against this land, detrital deposits still continued to be formed, as in Scotland, while over central Ireland and central and northern Europe the clearest and largest dissected country was the most suitable home for countless brachiopods, brachiopods, and great beds of sea lilies; sponges flourished in many parts of the sea, and their remains contributed largely to the formation of the beds of calcareous sandstone. In the south, the earlier volcanic rocks of the north-east of England and through South Wales and Somerset into Belgium and Westphalia; but a narrow ridge of elevated older rocks ran across the centre of England towards Belgium at this time.

The Carboniferous period was the age of the great raised beds. The limestones pass into the detrital culm formations, which owe their existence to a southern uplifted mass, the complement of the synclines already mentioned. Sediments approaching the culm type with the remainder of the overlying formations, were deposited in synclinal hollows in parts of France and Spain.

Thus western Europe in early Carboniferous time was occupied by a series of constricted, gulch-like seas; and on account of the steady pressure of the overlying deposits it is probable that the areas of clearer water, in which the limestone-building organisms could exist, were repeatedly able to spread, thus forming those thin limestones found interbedded with shale and sandstone which occur typically in the Yoredale district of Yorkshire and the region to the north, and also in the culm deposits of central Europe.

The spread of these limestones was repeatedly checked by the steady influx of detritus from the land during the pauses in movements of depression. Looking eastward, towards central and northern Europe, the clearer waters of the sea formed a continental type of deposit prevailed in the northern portion, and here, as in Scotland, we find coal-beds amongst the sediments (Moss basin). Further south in the Donetz basin the coal only appears in the thickness formed of the period.

In North America, the crustal movements at the beginning of the period are less evident than in Europe, but a marked parallelism exists: for in the east, in the Appalachian tract, we find detrital sediments forming one of the important deposits of Ohio and Pennsylvania extending from the Alleghenies into the interior of the continent. The open sea, with great deposits of lime-stone, lay out towards the west in the direction of that similar open sea which lay towards the east of Europe and extended through Asia.

The close of the early Carboniferous period was marked by an extraordinary increase of the orographical movements. Little ridges and antilines of the earlier part of the period became accentuated, giving rise to pronounced mountain ridges, right across Europe.

This movement commenced in the central and western part of the continent and the latter third of the period was marked by the final period. The mountains then formed have been called the "Palaeozoic Alps" by E. Kayser, the "Hercynian Mountains" by M. Bertrand. The most western range extended from Ireland through Wales and thence north-westwards to central Europe, but it is now limited to the Odenwald and Black Forest. The "Falz carbohydrates of Europe" mark the eastern limit of the Hercynian region. The western portion of the Carboniferous movements in the United States was the Appalachian, a series of mountains which continued into the later periods, and during which time the streets of the Appalachian and the Alleghenies were already operative in the same direction.

The formation of the present Appalachian chain began in the earlier part of this period and was continued, after its close, into the Permian; and there are traces of uplifts in central Asia and Armenia.

None of these movements appears to have affected the southern hemisphere.

The net result of the orogenic movements was, that at the close of the period there existed a great northern continental mass, extending from the Arctic sea to the Mediterranean; a southern continental mass, including South America, Africa, Australia and India. Between these land masses lay a great Mediterranean sea, the Tethys of Suess.

The conditions of climate. The beds of coal were formed will be found described under that head; it will be sufficient to notice here that some coal seams were undoubtedly formed by jungle or swamp-like growths on the site of the deposit, and it is equally true that oehrocs were formed by the transport and deposition of vegetable debris. The great quantity of organic remains which we observe in this connection that large tracts of land in many parts of the world were at a critical level as regards the sea, a condition highly favourable to frequent extensive incursions of marine waters over the low-lying areas in a period of extensive coastal or continental subsidences.

Vulcanicity. In intimate relationship with the mountain-building orogenic crustal movements was the prevalence of volcanic activity during the earlier part of this period. In the Lower Carboniferous rocks, too, we find the earliest volcanic rocks of the world; these, which were chiefly andesites, have been accompanied by the discharging of volcanics from a single independent vent. The plateau type was most extensively developed during the formation of the Carboniferous Sandstone; the puy type was of somewhat later date.

Carboniferous geology. The flora and fauna of the period are found in western North America, central Europe, and the British Isles, and are of considerable size and development. Similar eruptions are found also in Australia.

Climate. That the vegetation during this period was unusually exuberant there can be no doubt, and that a general uniformity of climate may be presumed. Plateau coal beds and the earliest type of coal measures, but by the uniformity of plant types over the whole earth. It is well, however, to guard against an over-estimation of this exuberance; it must be borne in mind that the physiography of the Carboniferous period was not uniform. The large number of fragmentary materials does not appear to have obtained so completely in any other period. The climate, we may assume from the distribution of land and water, was generally moist, and it would be probable that the conditions of the climate were not different from those of certain types of plants. But there is no good evidence for an excess of carbon dioxide in the atmosphere—an assumption found on the luxuriance of the vegetation, coupled with the fact that much of the vegetation grew aquatic, as is shown by the found in the coal beds.

The abundance of corals in some of the Carboniferous seas and possibly also the large size of some of the Productids and foraminifera may be taken as evidence of warm or temperate waters.

In spite of the bulk of the evidence being in favour of geniality of climate, we can recognize as the most notable fact that extensive glaciation prevailed in the northern part of the world, and that in the south, in central Africa and in central Europe, certain conglomergates have been assigned, somewhat doubtfully, to the same period. The great ice-sheets had a decided action. Glacial deposits certainly do exist in the Permo-carboniferous formations, which are described under that head, but in the true Carboniferous system glaciation may be taken as not proven.

The foreign boulders of granite, gneiss, &c., found in the coal beds of some districts, are quite as likely to have been dropped by rafts of vegetation as to have been carried by floating icebergs.

CARBONIFEROUS SYSTEM.
Economic Products.—Foremost among the useful products of the Carboniferous rocks is the coal (q.v.) itself; but associated with the coal seams in Great Britain, North America and elsewhere, are very important beds of ironstone, fire-clay, terra-cotta clay, and occasionally of limestone. In the coal measures, in the Lower Carboniferous Pocono sandstone of West Virginia and in the Berea grit of Ohio, where brine also occurs.

In the Carboniferous Limestone series, the purer kinds of limestone are used in the manufacture of making powder, products, also as a flux in the smelting of iron; some of the less pure varieties are used in making cement. The beds of chalk are utilized in the pottery industry, and some of the harder and more crystalline limestones are used in making bricks and tiles, for building a high proportion of the houses in England.

The sandstones are used for building, and for millstones and grindstones. Within the Carboniferous rocks, but due to the action of various agencies long after their deposition, are important ore formations. One of the most important of these is the iron ore, which is abundant in Belgium, Germany, and Britain, and in many ore regions in the United States.

References.—For a general account of the Carboniferous system, see A. Geikie, Text Book of Geology, vol. ii. (4th ed., 1903); and for the American development see T. C. Chamberlin and R. D. Salisbury, Geology, vol. ii. (1906). These two works give abundant references to the literature of the subject. CARBORUNDUM—CARCAR

CARBORUNDUM, a silicide of carbon formed by the action of carbon on sand (silica) at high temperatures, which on account of its great hardness is an important abrasive, and also has possible applications in the metallurgy of iron and steel. Its name was derived from carborundum (a form of alumina), from a mistaken view as to its composition. It was first obtained accidentally in 1807 by Acheson in America, when he was experimenting with the electric furnace in the hope of producing artificial diamonds. The experiments were followed up in an incandescent furnace, which on a larger scale is now employed for the industrial manufacture of the product. A full description of the process has been given in the Journ. Soc. Chem. Industry, 1867, vol. xvi. p. 863. The furnace is rectangular, about 16 ft. long and 5 ft. wide by 5 ft. high, with massive brick end walls 2 ft. thick, through which are built the carbon poles, consisting of bundles of 60 parings, 3 in. carbon rods 3 ft. in length, with a copper rod let into the outer end to connect it with a copper cap, which in turn is connected with one of the terminals of the generating dynamo. The spaces between the carbons of the electrode are packed tightly with graphite. In preparing the furnace for use, transverse iron screens are placed temporarily across each end, the space between these and the end walls being rammed with fine coke, and that in the interior is filled to the level of the centre of the carbon poles with the charge, consisting of 34 parts of coke, with 54 of sand, 10 of sawdust and 2 of salt. A longitudinal trench is then formed in the middle, and in this is arranged a cylindrical pile of fragments of coke about ½ in. or more in diameter, so that they form a core, about 22 in. in diameter, connecting the carbon poles in the end walls. Temporary side walls are then built up, the iron screens are removed, and a further quantity of charge is heaped up to a height of about 5 ft. above the top of the furnace. After a short current of about 80 amperes at 190 volts is now switched on; as the mass becomes heated by the passage of the current the resistance diminishes, and the current is regulated until after about 2 hours or less from starting it is maintained constant at about 6000 amperes and 125 volts. Carbon monoxide is given off and burns freely around the sides and top of the furnace, tinged yellow after a time by the sodium in the salt mixed with the charge. Meanwhile a shrinkage takes place, which is made good by the addition of a further quantity of charge until the operation is complete, usually in about 36 hours from the commencement. The current is then switched off, and the side walls, after cooling for a day, are taken down, the comparatively unaltered charge from the top is removed, and the products are carefully extracted. These consist of the inner carbon core, which at the temperature of the furnace will have been for the most part converted into graphite, then a thin black crust of graphite mixed with carborundum, next a layer of nearly pure crystallized carborundum about a foot in thickness, then grey amorphous carbide of silicon mixed with increasing proportions of altered charge, and lastly, on the outside, the portion of the charge which had never reached the temperature necessary for conversion, and which is altered only by the intrusion of salt from the inner part of the furnace. Special precautions are taken in making and breaking the intense current here used (amounting at the end to about 750 kilowatts, or 1000 E.H.P.), a water-regulator consisting of removable iron plates dipped in salt water being used for the purpose. In such a furnace as that above described the charge weighs about 14 tons, the yield of carborundum is about 3 tons, and the expenditure of energy about 3-9 kilowatt-hours (5-2 H.P.-hours) per pound of finished product. The carborundum thus produced is crystalline, greenish, bluish or brownish in colour, sometimes opaque, but often translucent, resisting the action of even the strongest acids, and the action of air or sulphur at high temperatures. The crude product can therefore be treated with hot sulphuric acid to purify it. In hardness it nearly equals the diamond, and it is used for tool-grinding in the form of vitrified wheels (mixed with powdered porcelain and iron, pressed into shape and fired in a kiln). Carborundum paper, made like emery paper, is now largely used in place of garnet paper in American shoe factories, and finds a market in other directions. The amorphous carbide, which was at first a waste product, has been tried, and is reported, with success as a lining for steel furnaces, as it is said not to be affected by iron or iron oxide at a white heat. (W. G. M.)

CARBOY (from the Pers. garābāk, a flagon), a large globular glass vessel or bottle, encased in wicker or iron-work for protection, used chiefly for holding vitriol, nitric acid and other corrosive liquids.

CARBUNCLE (Lat. carbunculus, diminutive of carbo, a glowing coal), in mineralogy, a garnet (q.v.) cut with a convex surface. In medicine the name given to an acute local inflammation of the deeper layers of the skin, followed by sloughing. It is accompanied by great local tension and by constitutional distress, and in the early stages the pain is often extremely acute. A hard flattened swelling of a deep-red colour is noticed on the back, face or extremities. This gradually extends until in some instances it may become so large as a dinner-plate. Towards the centre of the mass numerous small openings form on the surface, from which blood and matter escape. Through these openings a yellow slough or “core” of leathery consistence can be seen. Carbuncle is an intense local inflammation caused by septic germs which have in some manner found their way to the part. It is particularly apt to occur in persons whose health is depressed by mental worries, or by such troubles as chronic disease of the kidneys or blood-vessels, or by diabetes. The attack ends in mortification of the affected tissue, and, after much suffering, the core or mortified part slowly comes away. The modern treatment consists in cutting into the inflamed area, scraping out the germ-laden core at the earliest possible moment, and applying germicides. This method relieves the patient materially, and materialily diminishes the risk of blood-poisoning, and hastens convalescence. (E. O. *)

CARCAGÉNTE, or CARCAGÉNTE, a town of eastern Spain, in the province of Valencia, near the right bank of the river Júcar, at the junction between the Valencia-Murcia and Cartagáteno-Denia railways. Pop. (1900) 12,626. Carcagénte is a picturesque town, of considerable antiquity. Various Roman remains have been found in its neighbourhood. It is surrounded by groves of orange, palm and mulberry trees, and contains many Moorish houses, whose old-fashioned blue-tiled cupolas contrast with the chimneys of the silk mills and linen factories opened in modern times. An important local industry is the cultivation of rice, for which the moist and warm climate of the low-lying Júcar valley is well suited.

CÁRCAR, a town of the province of Cebú, island of Cebú, Philippine Islands, on the Cárcar river near its mouth at the head of Cárcar Bay, 23 m. S.W. of Cebú, the capital. It is connected with Cebú by a railway, and a branch of this railway extending across the island to Barili and Dumanjag was projected in 1908. Cárcar has some coast trade. The surrounding country.
CARCASS—CARCASSONNE

is rugged, and produces Indian corn and sugar in considerable quantity. The language is Cebú-Visayan. Cácar was founded in 1624.

CARCASS, the dead body of an animal. As a butcher's term, the word means the body of an animal without the head, extremities and offal. It is also used of a hollow iron case filled with combustibles, and fired from a howitzer to set fire to buildings, ships, &c., the flames issuing through holes pierced in the sides. The word is common in various forms to Romanic languages, but the ultimate origin is obscure. Possible derivations are from the Lat. cara, flesh, and Ital. carso or cessa, chest, or from a Med. Gr. τάρακσιον, a quiver, for which the Fr. is carquois, and Port. carcas.

CARCASSONNE, a city of south-western France, capital of the department of Aude, 57 m. S.E. of Toulouse, on the Southern railway between that city and Narbonne. Pop. (1906) 25,346. Carcassonne is divided by the river Aude into two distinct towns, the Ville Basse and the Cité, which are connected by two bridges, one modern, the other dating from the 13th century. The Cité occupies the summit of an abrupt and isolated hill on the right bank of the river. The dirty and irregular streets are inhabited by 8000 people, and the population of the town, which consists mainly of workers, and its interest lies in its ancient fortifications (see FORTIFICATION AND SIEGECRAFT) which, for completeness and strength, are unique in France and probably in Europe. They consist of a double line of ramparts, of which the outer measures more than 1500 yds. in circumference. These are protected at frequent intervals by towers, and can be entered only by two gates, one to the east, the other to the west, both of which are themselves elaborately fortified (see GATE). In the interior, and to the north of the western gate, a citadel adjoins the fortifications. A portion of the inner line is attributed to the Visigoths of the 6th century; the rest, including the castle, seems to belong to the 11th or 12th century, while the outer circuit has been referred mainly to the end of the 13th. The old cathedral of St Nazaire dates from the 11th to the 14th centuries. The nave was begun in 1096 and is Romanesque in style; the transept and choir, which contain magnificent stained glass of the Renaissance period, are of Gothic architecture. Both the fortifications and the church were restored by Viollet-le-Duc between 1850 and 1880. On the left bank of the Aude, between it and the Canal du Midi, lies the new town, clean, well-built and furnishing, with streets intersecting each other at right angles. It is surrounded by boulevards occupying the site of its ramparts, and is well provided with fountains, public squares and gardens planted with fine plane-trees. The most interesting buildings are the cathedral of St Michel, dating from the 13th century but restored in modern times, and St Vincent, a church of the 14th century, remarkable for the width of its nave.

Carcassonne is the seat of a bishop, a prefect and a court of assizes, and has tribunals of first instance and of commerce, a chamber of commerce and a branch of the Bank of France. It also has a lycée for boys, training-colleges, theological seminaries, a library and a museum rich in paintings. The old cloth industry is almost extinct. The town is, however, an important wine-market, and the vineyards of the vicinity are the chief source of its prosperity, which is enhanced by its port on the Canal du Midi. Tanning and leather-dressing, distilling, the manufacture of agricultural implements, furniture and coaks, coppering and the preparation of preserved fruits, are prominent industries.

Carcassonne occupies the site of Carcas, an ancient city of Gallia Narbonensis, which belonged to the Volcae Tectosages. It was a place of some importance at the time of Caesar's invasion, but makes almost no appearance in Roman history. On the disintegration of the empire, it fell into the hands of the Visigoths, who, in spite of the attacks of the Franks, especially in 585, retained possession till 724, when they were expelled by the Arabs, destined in turn to yield before long to Pippin the Short. From about 819 to 1082 Carcassonne formed a separate county, and from the latter date till 1247 a viscountship. Towards the end of the 11th century the viscounts of Carcassonne assumed the style of viscounts of Béziers, which they and its lords they had dominated since the fall of the Carolingian empire. The viscounty of Carcassonne, together with that of Béziers, was consecrated to the crown in 1247, as a result of the part played by the viscount Raymond Roger against Simon de Montfort in the Albigensian crusade, during which in 1209 the city was taken by the Crusaders (see ATAGENSES). A revolt of the city against the royal authority was severely punished in 1262 by the expulsion of its principal inhabitants, who were, however, permitted to take up their quarters on the other side of the river. This was the origin of the new town, which was fortified in 1347. During the religious wars, Carcassonne several times changed hands, and it did not recognize Henry IV. till 1596.

See E. E. Vitallet-le-Duc, La Cité de Carcassonne (Paris, 1858); L. Fédé, Histoire de Carcassonne (Carcassonne, 1887).

CARDAMOM, the fruit of several plants of the genera Elettaria and Amomum, belonging to the natural order Zingiberaceae, the principal of which is Elettaria Cardamomum, from which the true officinal or Malabar cardamom is derived. The Malabar cardamom plant is a large perennial herb with a thick fleshy rootstock and a flowering stem, 5 to 12 ft. high. The large leaves are arranged in two rows, have very long sheaths enveloping the stem and a lanceolate spreading blade 1 to 2½ ft. long. The fruit is an ovate-triangular, three-celled, three-valved capsule (about ½ in. long, of a dirty yellow colour) enclosing numerous angular seeds, which form the valuable part of the plant. It is a native of the mountainous parts of the Malabar coast of India, and the fruits are procured either from wild plants or by cultivation throughout Travancore, western Mysore, and along the western Ghauts. A cardamom of much larger size found growing in Ceylon was formerly regarded as belonging to a distinct species, and described as such under the name of Elettaria major; but it is now known to be only a variety of the Malabar cardamom. In commerce, several varieties are distinguished according to their size and flavour. The most esteemed are known as "shorts," a name given to such capsules as are from a quarter to half an inch long and about a quarter broad. Following these come "short-logs" and "long-logs," also distinguished by their size, the largest reaching to about an inch in length. The Odisha cardamom attains a length of an inch and a half and is about a third of an inch broad, with a brownish pericarp and a distinct aromatic odour. Among the other plants, the fruits of which pass in commerce as cardamoms, are the round or cluster cardamom, Amomum Cardamomum, a native of Siam and Java; the bastard cardamom of Siam, A. xanthoides—the Bengal cardamom, which is the fruit of A. subulatum, a native of Nepal; the Java cardamom, produced by A. maximum; and the Korarima cardamom of Somalliland. The last-named is the product of a plant which is unknown botanically. Cardamoms generally are possessed of a pleasant aromatic odour, and an agreeable, spicy taste. On account of their flavour they are much used with other medicines, and they form a principal ingredient in curries and compounded spices. In the north of Europe they are much used as a spice and flavouring material for cakes and liqueurs; and they are very extensively employed in the East for chewing with betel, &c. (For illus. see SPICE). CARDAN [Ital. CARDANO, Ger. GERONIMO ODER GERONIMO] (1501-1576), Italian mathematician, physician and astrologer, born of a Pavia on the 24th of September 1501, was the illegitimate son of Facio Cardano (1444-1524), a learned jurist of Milan, himself distinguished by a taste for mathematics. He was educated at the university of Pavia, and subsequently at that of Padua, where he graduated in medicine. He was, however, excluded from the College of Physicians at Milan on account of his illegitimate birth, and it is not surprising that his first book should have been an exposure of the fallacies of the faculty. A fortunate cure of the child of the Milanese senator Sforza now brought him into notice, and the interest of his patron procured him admission into the medical body. About this time (1539) he obtained additional celebrity by the publication of his Practica arithmeticae generalis, a work of great merit
for the time, and he became engaged in a correspondence with
Niccolo Tartaglia, who had discovered a solution of cubic
equations. This discovery Tartaglia had kept to himself, but
he was ultimately induced to communicate it to Cardan under a
solemn promise that it should never be divulged. Cardan,
however, published it in his comprehensive treatise on algebra
(Artis magna sive de regulis Algebrae liber unus) which appeared
at Nuremberg in 1545 (see Algebra: History). Two years
previously he had published a work even more highly regarded
by his contemporaries, his celebrated treatise on astrology. As
a believer in astrology Cardan was on a level with the best minds
of his age; the distinction consisted in the comparatively
cautious spirit of his inquiries and his disposition to confirm
his assertions by an appeal to facts, or what he believed to be such.
A very considerable part of his treatise is based upon observations
carefully collected by himself, and seemingly well calculated
to support his theories so far as they extend. Numerous instances
of his belief in dreams and omens may be collected from his
writings, and he especially valued himself on being one of the
five or six celebrated men to whom, as to Socrates, had been
vouchsafed the assistance of a guardian daemon.

In 1547 he was appointed professor of medicine at Pavia.
The publication of his works on algebra and astrology at this
juncture had gained for him a European renown, and procured
him flattering offers from Pope Paul III. and the king of Denmark,
both of which he declined. In 1551 his reputation was crowned
by the publication of his great work, De Subtilitate Rerum, which
embodied the soundest physical learning of his time and simul-
taneously represented its most advanced spirit of speculation.
It was followed some years later by a similar treatise, De Varietate
Rerum (1557), the two making in effect but one book. A great
portion of this is occupied by endeavours, commonlly futile, to
explain ordinary natural phenomena, but its chief interest for
us consists in the hints and glimpses it affords of principles beyond
the full comprehension of the writer himself, and which the world
was then by no means ready to entertain. The inorganic realm
of Nature he asserts to be animated no less than the organic;
all creation is progressive development; all animals were originally
worms; the inferior metals must be regarded as conatus naturae
through the production of gold. The indefinite varia-
bility of species is implied in the remark that Nature is seldom
content with a single variation from a customary type. The
oviparous habits of birds are explained by their tendency to
favour the perpetuation of the species, precisely in the manner
of modern naturalists. Animals were not created for the use
of man, but exist for their own sakes. The origin of life depends
upon cosmic laws, which Cardan naturally connects with his
favourite study of astrology. The physical diversities of man-
kind arise from the effects of climate and the variety of human
circumstances in general. Cardan's views on the dissimilarity of
languages are much more philosophical than usual at his time;
and his treatise altogether, though weak in particular details,
is strong in its pervasiveness over all knowledge and in the impor-
tance of nature, which renders it in some degree an adumbration
of the course of science since the author's day. It was attacked
by J. C. Scaliger, whom Cardan refuted without difficulty.

The celebrity which Cardan had acquired led in the same
year (1551) to his journey to Scotland as the medical adviser
of Archbishop Hamilton of St Andrews. The archbishop was
supposed to be suffering from consumption, a complaint which
Cardan, under a false impression, as he frankly admits, had
represented himself as competent to cure. He was of great
service to the archbishop, whose complaint proved to be
asthma; but the principal interest attaching to his expedition is
derived from his account of the disputes of the medical faculty at
doctors were disturbed by the heresies of Vesalius, who was
beginning to introduce anatomical study from the human subject.
Cardan's liberality of temper led him to sympathize with the
innovator. His account of Edward VI.'s disposition and under-
standing is extremely favourable, and is entitled to credit
as that of a competent observer without bias towards either side
of the religious question. He cast the king's nativity, and
indulged in a number of predictions which were effectually
confuted by the royal youth's death in the following year.

Cardan had now attained the summit of his prosperity, and
the rest of his life was little but a series of disasters. His principal
misfortunes arose from the crimes and calamities of his sons, one
of whom was an utter reprobate, while the tragic fate of the other
overwhelmed the father with anguish. This son, Giovanni
Battista, also a physician, had contracted an imprudent marriage
with a girl of indifferent character, Brandonia Seroni, who
subsequently proved unfaithful to him. The injured husband
revenged himself with poison; the deed was detected, and the
exceptional severity of the punishment seems to justify Cardan in
attributing it to the rancour of his medical rivals, with whom he
had never at any time been on good terms. The blow all but
crushed him; his reputation and his practice waned; he addicted
himself to gaming, a vice to which he had always been prone;
his mind became unhinged and filled with distempered imagina-
tions. He was ultimately banished from Milan on some accusa-
tion not specified, and although the decree was ultimately
rescinded, he found it advisable to accept a professorship at
Bologna (1562). While residing there in moderate comfort,
and mainly occupied with the composition of supplements to his
former works, he was suddenly arrested on a charge not stated,
but in all probability heresy. Though he had always been
careful to keep on terms with the Church, the bent of his mind
had been palpably towards free thought, and the circumstance
had probably attracted the attention of Pius V., who then ruled
the Church in the spirit, as he had formerly exercised the func-
tions, of an inquisitor. Through the intercession, as would
appear, of some influential cardinals, Cardan was released, but
was deprived of his professorship, prohibited from teaching and
publishing any further, and removed to Rome, where he spent
his remaining years in receipt of a pension from the pope.
He seems to have been urged in his favour that his intellect had
been disturbed by grief for the loss of his son—an assertion to which
his frequent hallucinations lent some countenance, though the
existence of any serious derangement is disproved by the lucidity
and coherence of his last writings. He occupied his time at
Rome in the composition of his commentaries, De Vita Propria,
which, along with a companion treatise, De Libris Propriis,
is our principal authority for his biography. Though he had
burned much, he left behind him more than a hundred MSS.,
nor twenty of which have been printed. He died at Rome on
the 21st of September 1576.

Alike intellectually and morally, Cardan is one of the most
interesting personages connected with the revival of science in
Europe. He had no especial bent towards any scientific pursuit,
but appears as the man of versatile ability, delighting in research
for its own sake. He possessed the true scientific spirit in
perfection; nothing, he tells us, among the king of France's
treasures appeared to him so worthy of admiration as a certain
natural curiosity which he took for the horn of a unicorn. It
has been suggested that Cardan's professed aversion to arduous
labour, partly in fields of research where no important discovery
was then attainable, partly in those where his discoveries could only
serve as the stepping-stones to others, by which they were
invariably eclipsed. His medical career serves as an illustration
of the former case, and his mathematical of the latter. His
medical knowledge was wholly empirical; restrained by the
authority of Galen, and debarred from the practice of anatomy,
nothing more could be expected than that he should stumble on
some fortunate nostrums. As a mathematician, on the other
hand, he effected important advances in science, but such as
merely paved the way for discoveries which have obscured his own.
From his astrology no results could be expected; but even here
the scientific character of his mind is displayed in his common-
sense treatment of what usually passed for a mystical and occult
study. His prognostications are as strictly empirical as his
prescriptions, and rest quite as much upon the observations
which he supposed himself to have made in his practice. As
frequently is the case with men incapable of rightly ordering
their own lives, he is full of wisdom and sound advice for others; his ethical precepts and practical rules are frequently excellent. To complete the catalogue of his accomplishments, he is no contemptible poet.

The work of Cardan's, however, which retains most interest for this generation is his autobiography, De Vita Propria. In its clearness and frankness of self-revelation this book stands almost alone among records of its class. It may be compared with the autobiography of another celebrated Italian of the age, Benvenuto Cellini, but is much more free from vanity and self-consciousness, unless the extreme candour with which Cardan reveals his own errors is to be regarded as vanity in a more subtle form. The general impression is highly favourable to the writer, whose impetuosity and fits of reckless dissipation appear as mere exaggerations of the warmth of heart which imparted such strength to his domestic affections, and in the region of science imparted that passionate devotion to research which could alone have enabled him to persevere so resolutely and effect such marked advances in such multifarious fields of inquiry.

Cardan's autobiography has been most ably condensed, and at the same time supplemented by information from the general body of his writings and other sources, by Henry Morley (Jerome Cardan, 1854, 2 vols.). His capital treatises, De Subtilitate and De Varietate Rerum, are combined and fully analysed in vol. ii. of Rixner and Sibell, Leben und Lehrmeinungen berühmter physiker am Ende des xvi. und am Anfange des xvii. Jahrhunderts (Sulzbach, 1820).

Cardan's works were edited in ten volumes by Sponius (Lyons, 1663). A biography was prefixed by Gabriel Naude, whose unreasoning depreciation has unduly lowered Cardan's character to posterity.

(R. G.)

**Cárdenas (San Juan de Dios de Cárdenas)**, a maritime town of Cuba, in Matanzas province, about 75 m. E. of Havana, on the level and somewhat marshy shore of a spacious bay of the northern coast of the island, sheltered by a long promontory. Pop. (1907) 24,280. It has railway communication with the trunk railway of the island, and communicates by regular steamers with all the coast towns. The city lies between the sea and hills. There are broad streets, various squares (including the Plaza de Colón, with a bronze statue of Columbus given to the city by Queen Isabel II. and erected in 1862) and substantial business buildings. Cárdenas is one of the principal sugar-exporting towns of Cuba. The shallowness of the harbour necessitates lighterage and repeated loading of cargoes. The surrounding region is famed for its fertility. A large quantity of asphalt has been taken from the bed of the harbour. A flow of fresh water from the bed of the harbour is another peculiar feature. It comes presumably from the outlets of subterranean rivers. There is a large united body of the United States of which has been, indeed, prominent in the city ever since its foundation. At El Varadero, on a peninsula at the mouth of the bay, there is fine sea-bathing on a long beach, and El Varadero is a winter resort. Cárdenas was founded in 1828, and in 1861 already had 12,910 inhabitants. In 1850 General Narciso Lopez landed here on a filibustering expedition, and held the town for a few hours, abandoning it when he saw that the people would not rise to support him in his efforts to secure Cuban independence. On the 11th of May 1898 an American torpedo-boat and revenue cutter here attacked three Spanish gun-boats, and Ensign Worth Bagley (1874-1898) was killed—the first American naval officer to lose his life in the Spanish-American War.

**Cardiff**, a city, municipal, county and parliamentary borough, seaport and market-town, and the county town of Glamorganshire, South Wales, situated on the Taff, r. above its outfall, 145 m. from London by the Great Western railway via Badminton, 40½ m. W. of Bristol and 45½ m. E.S.E. of Swansea. Cardiff is also the terminus of both the Taff Vale and the Rhymney railways, the latter affording the London & NBC. Western railway access to the town. The Barry line from Barry docks joins the Great Western and Taff Vale railways at Cardiff, and the Cardiff Railway Company (which owns all the docks) has a line from Pontypidd via Llanishen to the docks. The Glamorganshire canal, opened in 1794, runs from Cardiff to Merthyr Tydfil, with a branch to Aberdare. The increase of the population of Cardiff during the 19th century was phenomenal; from 1870 inhabitants in 1801, and 6187 in 1831 it grew to 32,954 in 1861. The borough, which originally comprised only the parishes of St John's and St Mary's, was in 1875 and 1895 extended so as to include Roath and a large part of Llandaff, known as Canton, on the right of the Taff. The whole area was united as one civil parish in 1903, and the population in 1901 was 164,333, of whom only about 8% spoke Welsh.

Probably no town in the kingdom has a nobler group of public buildings than those in Cathays Park, which also commands a view of the castle ramparts and the old keep. On opposite sides of a fine avenue are the assize courts and new town hall (with municipal offices), which are both in the Renaissance style. The Glamorgan county council has also a site of one acre in the park for offices. The University College of South Wales and Monmouthshire, founded in 1883, under the principaship of J. Viriamu Jones, for some time carried on its work in temporary buildings, pending the erection of the commodious and imposing building from the plans of Mr W. D. Caroe, in Cathays Park, where the registry of the University of Wales (of which the college is a constituent) is also situated. The Drapers' Company has given £15,500 towards building a library, in addition to previous donations to the engineering department and the scholarship fund of the college. The college has also been endowed for arts, pure and applied science, and technology, medicine, public health, music, and for the training of men and women teachers for elementary and secondary schools. Its library includes the Salesbury collection of books relating to Wales. Aberdare Hall is a hostel for the women students. The Baptist theological college of Pontypool was removed to Cardiff in 1895.

The public library and museum were founded in 1863, but in 1882 were removed to a new building which was enlarged in 1896. The library is especially rich in books and MSS. relating to Wales and in Celtic literature generally. These comprise the Welsh portion of the MSS., which belonged to Sir Thomas Phillipps of Middlehill (including the book of Aneurin—one of the "Four ancient books of Wales"), purchased for £3500. A catalogue of the printed books in the Welsh department, which soon became a standard work of reference, was published in 1898, while a catalogue of the Welsh MSS. was issued by the Historical MSS. Commission in 1903. There are six branch libraries, while a scheme of school libraries has been in operation since 1899. The chief features of the museum are collections of the fossils, birds and flowers of Wales, of ordinary Welsh costumes and dress, casts of the pre-Norman monuments of Wales, and reproductions of metal and ivory work illustrating various periods of art and civilization. There is also a unique collection of Swansea and Nantgarw china. The fine arts department contains twenty-seven oil paintings by modern English and continental artists bequeathed by William Menelaus of Dowlais in 1883, the Pyke-Thompson collection of about 100 water-colour paintings presented in 1890, and some 3000 prints and drawings relating to Wales. In 1905 Cardiff was selected by a privy council committee to be the site of a state-aided national museum for Wales, the whole contents of the museum and art gallery, together with a site in Cathays Park, having been offered by the corporation for the purpose. A charter providing for its government was granted on the 19th of March 1907. In Cathays Park there is also a "gorsesd" or bardic circle of huge monoliths erected in connexion with the eisteddfod of 1899.

The other public buildings of the town include the infirmary founded in 1837, the present buildings being erected in 1883, and subsequently enlarged; the sanatorium, the seamen's hospital, the South Wales Institute of Mining Engineers (which has a library built in 1884, the exchange, an institute for the blind, a school for the deaf and dumb, and one of the two prisons for the county (the other being at Swansea). There is a technical school, an intermediate school for boys and another for girls, a "higher-grade" and a pupil teachers' school. A musical festival is held triennially.

In the business part the buildings are also for the most part imposing and the thoroughfares spacious, while the chief
suburban streets are planted with trees. The Taff is spanned by two bridges, one a four-arched bridge rebuilt in 1838-1839 leading to Llandaff, and the other a cantilever with a central swinging span of 140 ft. 8 in.

In virtue of its being the shire-town, Cardiff acquired in 1355 the right to send one representative to parliament, which it did up until 1832, from which date Cowbridge and Llantrisant have been joined with it as contributory boroughs returning one member. The great sessions for the county were during their whole existence from 1542 to 1830 held at Cardiff, but the assizes (which replaced them) have since then been held at Swansea and Cardiff alternately, as also are the quarter sessions for Glamorgan. The borough has a separate commission of the peace, having a stipendiary magistrate since 1858. It was granted a separate court of quarter sessions in 1862, it was constituted a county borough in 1888, and, by letters patent dated the 28th of October 1902, it was created a city and the dignity of lord mayor conferred on its chief magistrate. The corporation consists of ten aldermen and thirty councillors, and the area of the municipal borough is 8408 acres.

Under powers secured in 1854, the town obtains its chief water supply from a gathering ground made up of the sources of the Taff on the old red sandstone and the northern out-crop of the mineral basin and on the southern slopes of the Brecon Beacons. Here two reservoirs of a combined capacity of 668 million gallons have been constructed, and a conduit some 36 m. long laid to Cardiff at a total cost of about £1,250,000. A third reservoir is authorized. A gas company, first incorporated in 1837, supplies the city as well as Llandaff and Penarth with gas, but the corporation also supplies electric power both for lighting and working the tramways, which were purchased from a private company in 1898. The city owned in 1905 about 290 acres of parks and "open spaces," the chief being Roath Park of 100 acres (including a botanical garden of 15 acres), Llandaff fields of 70 acres, and Cathays Park of 60 acres, which was acquired in 1900 mainly with the view of placing in it the chief public buildings of the town.

Commerce and Industries.—Edward II.'s charter of 1324 indicates that Cardiff had become even then a trading and shipping centre of some importance. It enjoyed a brief existence as a staple town from 1327 to 1353. During the 15th century Elizabeth and James I. considered it as a resort of pirates, and ironfounders of the district were suspected of secretly supplying Spain with ordnance. It was for centuries a "head port," its limits extending from Chepstow to Llanelli; in the 18th century it sank to the position of a "creek" of the port of Bristol, but about 1840 it was made independent, its limits for customs' purposes being defined as from the Rumney estuary to Nash Point, so that technically the "port of Cardiff" includes Barry and Penarth as well as Cardiff proper. Down to the end of the 18th century there was only a primitive quay on the river side for shipping purposes. Coal was brought down from the hills on the backs of mules, and iron carried in two-ton wagons. In 1798 the first dock (12 acres in extent) was constructed at the terminus of the Glamorgan canal from Merthyr. The commercial greatness of Cardiff is due to the vast coal and iron deposits of the country drained by the Taff and Rhymney, between whose outlets the town is situated. But a great impetus to its development was given by the 2nd marquess of Bute, who has often been described as the second founder of Cardiff. In 1830 he obtained the first act for the construction of a dock, which (now known as the West Bute dock) was opened in 1839 and measures (with its basin) 10½ acres. The opening of the Taff railway in 1840 and of the South Wales railway to Cardiff in 1850 necessitated further accommodation, and the trustees of the marquess (who died in 1848) began in 1851 and opened in 1855 the East Bute dock and basin measuring 46½ acres. The Rhymney railway to Cardiff was completed in 1858 and the trade of the port so vastly increased that the shipment of coal and coke went up from 4562 tons in 1839 to 1,706,000 tons in 1860. In 1864 the Bute trustees unsuccessfully sought powers for constructing three additional docks to cost two millions sterling, but under the more limited powers granted in 1866, the Roath basin (12 acres) was opened in 1874, and (under a substituted act of 1882) the Roath dock (33 acres) was opened in 1887. All these docks were constructed by the Bute family at a cost approaching three millions sterling. Still they fell far short of the requirements of the district for in 1869 the Taff Vale Railway Company opened a dock of 26 acres under the headland at Penarth, while in 1884 a group of colliery owners, dissatisfied with their treatment at Cardiff, obtained powers to construct docks at Barry which are now 17½ acres in extent. The Bute trustees in 1885 acquired the Glamorgan canal and its dock, and in the following year obtained an act for vesting their various docks and the canal in a company now known as the Cardiff Vale Railway Company. The South Bute dock of 50½ acres, authorized in 1894 and capable of accommodating the largest vessels afloat, was opened in 1907, bringing the whole dock area of Cardiff (including timber ponds) to about 210 acres. There are also ten private graving and floating docks and one public graving dock. There is ample equipment of fixed and movable staiths and cranes of various sizes up to 70 tons, the Lewis-Hueter patent cranes being largely used for shipping coal owing to their minimizing the breakage of coal and securing greater economy in its movement to the docks. The landing of foreign cattle is permitted by the Board of Trade, and the slaughter of beef and mutton takes place near the Cardiff wharf. The total exports of Cardiff in 1906 amounted to 8,767,502 tons, of which 8,433,629 tons were coal, coke and patent fuel, 151,912 tons were iron and steel and their manufactures, and 181,076 tons of general merchandise. What Cardiff lacks is a corresponding import trade, for its imports in 1906 amounted to only 2,108,133 tons, of which the chief items were iron ore (£85,610 tons), pit-wood (303,407 tons), grain and flour (208,197). Taking "the port of Cardiff" in its technical sense as including Barry and Penarth, it is the first port in the kingdom for shipping cleared to foreign countries and British possessions, second in the kingdom for its timber imports, and first in the world for shipment of coal.

The east moors, stretching towards the outlet of the Rhymney river, have become an important metallurgical quarter. Copper works were established here in 1866, followed long after by tinning and enamel works. In 1888 the Dowlais Iron Company (now Messrs Guest, Keen & Nettlefold, Ltd.) acquired here some ninety acres on which were built four blast furnaces and six new steam engines. The total output of iron and steel in the city several large mill and breweries, a biscuit factory and hemp and hemp rope works, general foundries and engineering works. At Ely, 3½ m. out of Cardiff, there are also breweries, a small tin works and large paper works. The newspapers of Cardiff include two weeklies, the Cardiff Times and Weekly Mail, founded in 1857 and 1870 respectively, two morning dailies, the South Wales Daily News and Western Mail, established in 1872 and 1869 respectively, and two evening dailies.

History and Historic Buildings.—In documents of the first half of the 12th century the name is variously spelt as Cairof, Cawri, and Kardid. The Welsh form of the name, Caerdydd (pronounced Caerdeel, with the accent on the second syllable) suggests that the name means "the fort of (Aulus?) Didius," rather than Caeer Dâf ("the fortress on the Taff"), which is nowhere found (except in Leland), though Caer Dyv once existed as a variant. No traces have been found of any pre-Roman settlement at Cardiff. Excavations carried out by the marquess of Bute from 1889 onward furnished for the first time conclusive proof that Cardiff had been a Roman station, and also revealed the sequence of changes which it had undergone. There was first, on the site occupied by the present castle, a camp of about ten acres, probably constructed after the conquest of the Silures A.D. 75-77, so as to command the passage of the Taff, which was here crossed by the Via Maritima running from Gloucester to St David's. In later Roman times there were added a series of polygonal bastions, of the type found at Caerleon. This period also belongs the massive rampart, over 10 ft. thick, and the north gateway, one of the most perfect Roman gateways in Great Britain. After the departure of the Romans the walls became ruinous or were partly pulled down,
CARDIGAN, LORD

Perhaps by sea rovers from the north. In this period of anarchy the native princes of Glamorgan had their principal demesne, not at the camp but a mile to the north at Ll Yadbol, now merely a thatched farmhouse, while some Saxon invaders threw up within the camp a large motled mound on which the Normans about the beginning of the 12th century built the great shell-keep which is practically all that remains of their original castle. Its builder was probably Robert, earl of Gloucester, who also built Bristol castle. Then or possibly even earlier the old rampart was for two-thirds of its circuit buried under enormous earthworks, the remainder being rebuilt. It was in the keep, and not, as tradition says, in the much later “Black Tower” (also called “Duke Robert’s Tower”), that Robert, duke of Normandy, was imprisoned by order of his brother Henry I. from 1108 until his death in 1134. Considerable additions of later date, in the Decorated and Perpendicular styles, are due to the Despensers and to Beauchamp, earl of Warwick, while the present residential part is of various dates ranging from the 15th century down to the last half of the 19th, when a thorough restoration, including the addition of a superbly ornamented clock-tower, was carried out. The original ditch, about 20 yds. wide, still exists on three sides, but it is now converted into a “feeder” for the docks and canal. Geoffrey of Monmouth was at one time chaplain of the castle, where he probably wrote some of his works. The scene of the “sparrow-hawk” tournament, described in Gwyst a’nd Enidy, one of the Arthurian romances, is laid at Cardif.

On the conquest of the district by the Normans under Fitz Hamon, Cardif became the caput of the seigniory of Glamorgan, and the castle the residence of its lords. The castle and lordship descended by heirship, male and female, through the families of De Clare, Despenser, Beauchamp and Neville to Richard III., on whose fall they escheated to the Crown, and were granted later, first to Jasper Tudor, and finally by Edward VI. in 1550 to Sir William Herbert, afterwards created Baron Herbert of Cardif and earl of Pembroke. Through the daughter and granddaughter of the 7th earl the castle and estates became the property of the 1st marquess of Bute (who was created Baron Cardif in 1776), to whom direct descendant they now belong.

The town received its earliest known grant of municipal privileges sometime before 1147 from Fitz Hamon’s successor and son-in-law Robert, earl of Gloucester. In 1284 the inhabitants petitioned the burgesses of Hereford for a certified copy of the customs of the latter town, and these furnished a model for the later demand for the growingcommunity of Cardif from its king. Cardif in turn furnished the model for the Glamorgan towns such as Neath and Kenfig. In 1324 Edward II. granted a number of exemptions to Cardif and other towns in South Wales, and this grant was confirmed by Edward III. in 1355, Henry IV. in 1400, Henry VI. in 1452, and Edward IV. in 1465.

Its most important early charter was that granted in 1340 by Hugh de Despenser, whereby the burgesses acquired the right to nominate persons from whom the constable of the castle should select a bailiff and other officers, two ancient fairs, held on the 26th of June and 10th of September, were confirmed, and extensive trading privileges were granted, including the right to form a merchant guild. A charter granted in 1421 by Richard de Beauchamp provided that the town should be governed by twelve elected aldermen, but that the constable of the castle should be mayor. In 1581 Queen Elizabeth granted a confirmatory charter to the mayor and bailiffs direct without reference to the lord of the castle. The town was treated as a borough by prescription until 1608, when James I. confirmed its status by express incorporation, adding also to its rights of self-government and granting a third fair (on the 30th of November). In 1687 the town surrendered this charter to James II., who in a substituted one, which, however, was never acted upon, reserved to the Crown the right of removing any member of the corporation from office. The first step towards the modern improvement of the town was taken in 1774, when a special act was obtained for the purpose. Nineteen private acts and provisional orders were obtained during the 19th century.

Among the many early English kings who visited or passed through Cardif was Henry II., on whom in 1171, outside St Firan’s chapel (which has long since disappeared), he urged the duty of Sunday observance. About 1153, Ivor Bach (or the Little), a neighbouring Welsh chieftain, seized the castle and for a time held William, earl of Gloucester, and the countess prisoners in the hills. In 1409 Owen Glendower burnt the town, except the quarters of the Friars Minors. In 1645, after the battle of Naseby, Charles I. visited the town, which until then had been mainly Royalist, but about a month later was taken by the Parliamentarians. In 1648, a week after the Royalists had been decisively defeated by Colonel Horton at St Fagan’s, 4 m. west of Cardif, Cromwell passed through the town on his way to Pembroke.

Outside the north-west angle of the castle, Richard de Clare in 1256 founded a Dominican priory, which was burnt by Glendower in 1404. Though rebuilt, the building fell into decay after the Dissolution. The site was excavated in 1887. Outside the north-east angle a Franciscan friary was founded in 1280 by Gilbert de Clare, which at the Dissolution became the residence of a branch of the Herbert family. Its site was explored in 1896. The only other building of historic interest is the church of St Stephen’s, called the Swansea Baptist, and, in community of style, its fine tower having been built about 1443 by Burt, who also built the towers of Wrexham and St Stephen’s, Bristol. In the Herbert chapel is a fine altar tomb of two brothers of the family. A sculptured stone reredos by W. Goscombe John was erected in 1896. The original church of St Mary’s, at the mouth of the river, was swept away by a tidal wave in 1607: Wordsworth took this as a subject for a sonnet.

In 1555 Rawlins White, a fisherman, was burnt at Cardif for his Protestantism, and in 1679 two Catholic priests were executed for recusancy. Cardif was the birthplace of Christopher Love (b. 1618), Puritan author, and of William Ebury, sometime vicar of St Mary’s in the town, who, with his curate, Walter Craddock, were among the founders of Welsh nonconformity.

As to Roman Cardif see articles by J. Ward in the Archaeologia for 1869 (vol. iv.), and in Archaeologia Cambrensis for 1890. As to the castle and the Black and Grey Friars see Archaeologia Cambrensis, 3rd series, viii. 251 (reprinted in Clark’s Medieval Military Architecture), 5th series, vii. 283; xvii. 55; 6th series, i. 69. The charters of Cardif and Materials for a History of the County of Glamorgan from the Earliest Times are published by order of the corporation in Cardif Records (5 vols., 1898, 9th). See also a Handbook of Cardif and District, prepared for the use of the British Association, 1891; Cardif, an Illustrated Handbook, 1896; the Annual Report of the Cardif Chamber of Commerce, 1st Calendar of the University College.

CARDIGAN, JAMES THOMAS BRUDENELL, 7TH EARL OF (1707–1868), English lieutenant-general, son of the 6th earl of Cardif (the title dating from 1661), was born at Hambledon, Bucks, on the 16th of October 1797. He studied for several terms at Christ Church, Oxford; and in 1815 entered parliament. He entered the army in 1824 as cornet in the 8th Hussars, and was promoted within eight years, by purchase, to be lieutenant-colonel in the 15th Hussars. With this regiment he made himself one of the most unpopular of commanding officers. He gave the reins to his natural overbearing and quarrelsome temper, treating his men with excessive rigour and indulging in unscrupulous licentiousness. Within two years he held 105 courts-martial, and made more than 700 arrests, although the actual strength of his regiment was only 350 men. In consequence of one of his numerous personal quarrels, he left the regiment in 1834; but two years later, at the urgent entreaty of his father, he was appointed to the command of the 11th Hussars. He played the same part as before, and was censured for it; but he was allowed to retain his post, and the discipline and equipment of his regiment, in which he took great pride, and on which he spent large sums of money, received high commendation from the duke of Wellington. He succeeded to the peerage on the death of his father in August 1837. In September 1840 Lord Cardif fought a duel, on Wimbledon common, with one of his own
CARDIGAN—CARDIGANSHIRE

officers. The latter was wounded, and Lord Cardigan was tried before the House of Lords on a charge of feloniously shooting his adversary. But the trial was a mere sham, and on a trivial technical ground he was acquitted. In 1854, at the outbreak of the Crimean War, he was appointed to the command of the light cavalry brigade, with the rank of major-general, and he spent a very large sum in the purchase of horses and on the equipment of his regiment. He took a prominent part in the early actions of the campaign, and displayed throughout the greatest personal courage and the greatest recklessness in exposing his men. In the charge of the light brigade at Balaklava (q.v.) he was the first man to reach the line of the Russian guns; and Cardigan and his men alike have been credited by the bitterest critics of the charge with splendid daring and unquestioning obedience to orders. At the close of the war he was created K.C.B., and was appointed inspector-general of cavalry, and this post he held till 1860. In 1863 he engaged without success in legal proceedings against an officer who had published an account of Balaklava which the earl held to contain a reflection on his military character. He attained the rank of lieutenant-general in 1867. He was twice married, in 1836 and 1858, but had no children. On his death, which took place on the 28th of March 1868, the family titles (including the English barony of Brudenell, cr. 1628) passed to his relative, the second marquess of Ailesbury.

CARDIGAN (Aberbeini), a seaport, market-town and municipal borough, and the county town of Cardiganshire, Wales, picturesquely situated on the right bank of the Teifi about 3 m. above its mouth. Pop. (1901) 3,511. It is connected by an ancient stone bridge with the suburb of Bridgend on the southern or Pembroke bank of the river. It is the terminal station of the Whidland-Cardigan branch of the Great Western railway. Owing to the bar at the estuary of the Teifi, the shipping trade is inconceivable, but there are brick-works and furnaces in the town; and as the centre of a large agricultural district, Cardigan market is well attended. There is a curious local custom of mixing “culm,” a compound of clay and small coal, in the streets. The town has for the most part a modern and prosperous appearance. Two bastions with some of the curtain wall of the ancient castle remain, whilst the dwelling-house known as Castle Green contains part of a drum tower, and some vaulted chambers of the 13th century. The chancel of the Priory church of St Mary is an interesting specimen of early Perpendicular work, and the elaborate tracery of its fine east window contains some fragments of ancient stained glass. It is the only existing portion of a Benedictine house which was originally founded by Prince Rhys ap Griffith in the 12th century.

Although a Celtic settlement doubtless existed near the mouth of the Teifi from an early period, it was not until Norman times that Cardigan became a place of importance. Its castle was first erected by Roger de Montgomery about the year 1061, and throughout the 12th and 13th centuries this stronghold of Cardigan played no small part in the struggle between Wales and England. A long succession of Welsh princes and English earls vied with each other in the cost of maintaining the great fortresses, and the castle and the small town dependent on it. In 1136 the English army under Randolf, earl of Chester, was severely defeated by the Welsh at Crug Mawr, now called Bank-y-Warran, a rounded hill 2 m. north-east of the town. During the latter part of the 13th century the castle became the residence of Rhys ap Griffith, prince and justiciar of South Wales (d. 1165), who kept considerable state within its walls, and entertained here in 1188 Archbishop Baldwin and Gwalterus Cambrensis during their preaching of the Third Crusade. In 1284 Edward I. spent a month in the castle, settling the affairs of South Wales. This famous pile was finally taken and destroyed by the Parliamentary Major-General Laugharne in 1645. The lordship, castle and town of Cardigan formed part of the dower bestowed on Queen Catherine of Aragon by King Henry VII. Henry VIII.’s charter of 1542 confirmed earlier privileges granted by Edward I. and other monarchs, and provided for the government of the town by a duly elected mayor, two bailiffs and a coroner. In 1887 the assizes and quarter sessions were removed hence to Lampeter, which has a more central position in the county. Cardigan was declared a parliamentary borough in 1546, but in 1885 its representation was merged in that of the county.

CARDIGANSHIRE (Cardigifn, Str Aberbeini), a county of South Wales, bounded N. by Merioneth, E. by Montgomery, Radnor and Brecon, S. by Carmarthen and Pembroke, and W. by Cardigan Bay of the Irish Sea. It has an area of 688 sq. m., so that it ranks fifth in size of the Welsh counties. The whole of Cardiganshire is hilly or undulating, with the exception of the great bogs of Borth and Tregaron, but the mountains generally have little grandeur in their character; Plinlimmon itself, on the boundary of the county with Montgomeryshire, in spite of its elevation of 2463 ft., being singularly deficient in boldness of outline. Of other hills, only Tregaron Mountain (1778 ft.) exceeds 1500 ft. in height. Of the rivers by far the most important is the Teifi, or Tivy, which rises above Tregaron in Llyn Teifi, one of a group of tiny lakes which are usually termed the Teifi Pools, and flows southward through the county as far as Lampeter, forming from this point onwards its southern boundary. A succession of deep pools and rushing shallows, the Teifi has from the earliest times been celebrated for the quantity and quality of its salmon, which are netted in great numbers on Cardigan Bar. Trout and sewin (a local species of sea-trout) are also plentiful, so that the Teifi is much frequented by anglers. This river is also believed to have been the last British haunt of the beaver (ofange, lostyddan), for the slaying of which a very heavy penalty was exacted by the old royal laws of Wales. Giralduis Cambrensis, Michael Drayton, and other writers allude to this circumstance, though at what date the beaver became extinct in these waters is quite uncertain. On the Teifi may frequently be observed fishermen in coracles. Other rivers worthy of mention are the Dovey (Dyfi), separating Cardigan from Merioneth in the extreme north; the Rheidol and the Ystwyth, which rise in Plinlimmon; and the Aeron, which has its source in Llyn Eiddwen, a pool in the hilly district known as Myidd Bach. All these streams flow westward into Cardigan Bay.

The valley of the Teifi presents many points of great beauty and interest between Llandysul and the sea. The rapids of Henllan, the falls of Cenarth and the wooded cliffs of Coedmore constitute some of the finest scenery in South Wales. The valley of the Aeron is well wooded and fertile, while the Rheidol contains amidst striking surroundings the famous cascade spanned by the Devil’s Bridge, which is known to the Welsh as Pont-ar-Fynach (the Monks’ Bridge).

Geology.—The rocks of Cardiganshire consist of shales, slates and grits which have been folded and uplifted so that nowhere do they present their original horizontality. They belong partly to the Ordovician and Silurian periods; they have yielded few fossils, and much work remains to be done upon them before the stratigraphical subdivisions can be clearly defined. Many metalliferous deposits occur in the rocks and the lead mines have long been famous; it was from the profits of his mining speculations, carried on chiefly in this county, that the celebrated Sir Hugh Myddleton was enabled to carry out his gigantic project for supplying London with water from the River Severn. The coal and copper ores have also been obtained. Tregaron is the centre of the copper mining districts of the counties of Cardigan, Brecon and Montgomery. The copper is found in small veins in the coal, and is obtained from the mines at Ystrym, Llancarfan, Penllyn, and Trelech. The copper is used for the manufacture of the ceramic ware and pottery of the district. The Llanfihangel and Penllyn mines are among the most important.

The lead mines have been worked at Devil’s Bridge, Corris, Strata Florida, Goginan, &c. Glacial drift occupies some of the lower ground, and peaty bogs are common on the mountains. A small tract of blown sand lies at the mouth of the river Dovey.

Industries.—The climate on the coast is mild and salubrious, but that of the hill country is cold, bleak and rainy. The cultivated crops consist of oats, wheat, barley, turnips and potatoes; and in the lower districts on the coast, especially in the neighbourhood of Cardigan, Aberaeron and Llanrhydysed, good crops are raised. The uplands are mostly covered by wild heathy pastures, which afford good grazing for Welsh mountain sheep and ponies. The country has long been celebrated for its breed of “Cardiganshire cobs,” for which high prices are often obtained from English dealers, who frequent the local horse fairs, especially Dalis Fair at Lampeter. Cattle, sheep, pigs, butter, oats, wool, flannel and coarse slates form the principal
articles of export. Hand-loomers are by no means uncommon in the remote parts of the county, and clog-making of alder wood meets a local demand. The North Cardiganshire lead-mines, of which the Lisburne, Goginan and Cwm Ystwyth mines are the most noted, have been famous, and are said to have been worked by the Romans. Some of the lead raised is very rich in silver, and in the 17th century so great was the amount of silver obtained that a mint for coining it was erected by virtue of letters patent at Aberystwyth.

Communications.—The railways within the county are the Cambrian, by means of which access is given to Aberystwyth from all parts of the kingdom; and the former Manchester & Milford line, which runs south from Aberystwyth by Lampeter to Pencader, and has been acquired by the Great Western railway. The lower valley of the Teifi, or Tivy-side, is reached by means of two branch lines of the Great Western railway—one from Whitland to Cardigan, and the other from Pencader to Llandysul and Newcastle-Emlyn.

Population and Administration.—The area of the administrative county is 443,972 acres, with a population in 1801 of 63,467, and in 1901 of 62,257. The municipal boroughs are Aberystwyth (pop. 80,033), Cardigan (3511) and Lampeter (1722). Aberaeron and New Quay are urban districts. Other towns are Tregaron (1509), an ancient but decayed market-town in a wild boggy district; Aberaeron (1331), a small seaport, and Llandysul (2801), a rising place on the Teifi with woollen factories. In modern times several small watering-places have sprung up on the coast, notably at Borth, New Quay, Tresaith, Aberporth and Gwbert. Quarter sessions are held at Lampeter, and here also are held the assizes for the county, which lies in the South Wales circuit. The county returns one member of parliament, and has no parliamentary borough. Ecclesiastically it lies wholly in the diocese of St David's, and contains sixty-six parishes.

History.—In spite of its poverty and sparse population, Cardiganshire, a county that has always been able to play a prominent part in all Welsh political, literary and educational movements. The early history of the district is obscure, but at the time of the Roman invasion it was tenanted by the Dimetiae, a Celtic tribe, within whose limits was comprised the greater portion of the south-west of Wales. After the departure of the Romans, the whole basin of the Teifi eventually fell into the power of Ceredig, son of Cunedda Wledig of North Wales; and the district, peopled with his subjects and nearly co-extensive with the existing shire, obtained the name of Ceredigion, later corrupted into Cardigan. During the 5th and 6th centuries Ceredigion was largely civilized by Celtic missionaries, notably by St David and St Padarn, the latter of whom founded a bishopric at Llanbadarn Fawr, which in the 6th century became merged in the see of St David's. Two important local traditions, evidently based on fact, are associated with this remote era:—the inundation of the Cantref-y-Gwaedol and the synod of Llanddewi Brei. The Cantref-y-Gwaedol (the lowland Hundred), a large tract of pasture-land containing sixteen townships, and protected from the inroads of the sea by sluices, was suddenly submerged at an uncertain date about the year 500. The legend of its destruction declares that Seithenyn, the drunken keeper of the sluices, carelessly let in the waters of the bay, with the result that the land was lost for ever, and Prince Gwyddno and his son Elphin, with all their subjects, were forced to migrate to the wild region of Snowdon. This tale has ever been a favourite theme with Welsh bards, so that “the sigh of Gwyddno when the wave turned over his land” remains a familiar figure of speech throughout Wales. In support of this story it may be mentioned that there are indications of submerged dwellings and roads (e.g. the Sam Cynfelin and Sam Badrig) between the mouth of the Dovey and Cardigan Head. The famous synod of Brei, an historical fact clouded by miraculous details, probably took place early in the 6th century, when at a largely attended meeting of the Welsh clergy held at Brei, near the source of the Teifi, St David's eloquence for ever silenced the champions of the Pelagian heresy. In the 10th and 11th centuries the coast of Ceredigion suffered much from the inroads of the Danes, and in later times of the Normans and Flemings; but on the whole the native inhabitants seem to have maintained a successful resistance. By the close of the 11th century most of Ceredigion had been reduced by the Normans, and during the 12th and 13th centuries it formed a favourite battle ground between the Welsh princes and the English forces. By the Statutes of Rhuddlan (1284) Edward I. constituted Ceredigion out of the former principality of Wales a shire on the English model, dividing the new county into six hundreds and fixing the assizes at Carmarthen. By the act of Union in the reign of Henry VIII., the boundaries of the county were subsequently enlarged to their present size by the addition of certain outlying portions of the Marches round Tregaron and Cardigan, and the assizes were assigned to the county town. During the rebellion of Owen Glendower in the opening years of the 15th century, the county was again disturbed, and Owen for a short time actually held a court in Aberystwyth Castle. In the year 1485, according to local tradition, Henry of Richmond marched through South Cardiganshire on his way to Bosworth Field, and it is stated he has raised recruits round Llanarth, where the old mansion of Wern, still standing, is pointed out as his halting-place on this occasion. Under Henry VIII. Cardiganshire was for the first time empowered to send a representative member to parliament, and under Mary the same privilege was extended to the boroughs. During the Great Rebellion the county—which possessed at least three leading Parliamentarians in the persons of Sir John Vaughan, of Crosswood, afterwards Chief Justice of the common pleas; Sir Richard Pryse, of Gogerddan; and James Philipps, of Cardigan Priory—seems to have been less Royalist in its sympathies than other parts of Wales. At this time the castles of Cardigan and Aberystwyth, both held in the name of King Charles, were reduced to ruins by the Cromwellian army. In the 18th century the Methodist movement found great support in the county; in fact, Daniel Rowland (1717-1790), curate of Llangetho, was one of the chief leaders, and particularly interested in the revival. The 19th century witnessed the foundation of two important educational centres in the county:—St David's College at Lampeter (1827), and one of the three colleges of the university of Wales at Aberystwyth (1872). In the years 1842-1843 the county was much disturbed by the Rebecca Riots, during which a large number of turnpike gates were destroyed by local mobs. Forty-five years later it was affected by the Welsh agrarian agitation against payment of tithe, which produced some scenes of violence against the training police, especially in the district round Llangranog.

Chief amongst the county families of Cardigan is that of Lloyd, descendants of the powerful Cadifor ap Dinawal, lord of Castle Howell, in the 12th century. Certain branches of this family, such as the Lloyds of Millfield (Maes-y-felin), the Lloyds of Llanlyr and the Lloyds of Peterwell, are extinct, but others are still flourishing. The family of Vaughan of Crosswood, or Trawscoed (now represented by the earl of Lisburne), has held its family estates in the male line for many centuries. A representative in the female line of the ancient house of Pryse, long prominent in the annals of the county, still possesses the old family seat of Gogerddan. Other families worthy of mention are Lloyd of Bronwydd, Pynl of Nanteos and Johnes of Hafod and Llanfair-Clydogau.

Antiquities.—Scattered over all parts of the county are numerous British or early medieval tumuli and camps. Traces of the ancient Roman road, the Via Occidentalis—called by the Welsh Sarn Helen, a corruption of Sarn Leon, Road of the Legion—are to be found in the eastern districts of the county; and at Llanio are to be seen what are perhaps the remains of the Roman military station of Loventium. There are also various inscribed and incised stones, of which good examples exist in the churchyards of Llanbadarn Fawr and Llanddewi Brei. In buildings of interest Cardiganshire is singularly deficient. Besides the ruins of Aberystwyth and Cardigan Castles, and of Strata Florida Abbey, there is a large cruciform church of the 12th century at Llanbadarn Fawr; whilst the massive parish church of Llanddewi Brei once formed part of the minster of a prebendal college founded by Bishop Beck of
CARDINAL

St David's towards the close of the 13th century. Tregaron, Llanwenog, Llandysul and Llanarow own parish churches with western towers of early date, but for the most part the ecclesiastical structures of Cardiganshire are small in size and mean in appearance, and many of them were entirely rebuilt during the latter half of the 19th century. The little church of Eglwys Newydd, near the Devil's Bridge, contains one of Sir Francis Chantrey's masterpieces, a white marble group in memory of Marianne Johnes (1818), the daughter of Thomas Johnes, of Hafod (1748-1816), the translator of Froissart.

Customs, etc.—The Old Welsh costume, customs and superstitions are fast disappearing, although they linger in remote districts such as the neighbourhood of Llanegryn. The steeple-crowned beaver hat has practically vanished, although it was in general use within living memory; but the short petticoat and overskirt (pasa-a-gân-bûch), the fluffed mob-cap, little check shawl and buckled shoes are still worn by many of the older women. Of peculiarly Welsh customs, the bidding (gwahoddiad) is not quite extinct in the county. The bidding was a formal invitation sent by a betrothed pair through a bidder (gwahoddiwr) to request the presence and gifts of all their neighbours at the forthcoming marriage. All present sent were duly registered in a book with a view to repayment, when a similar occasion should arise in the case of the donors. When printing became cheap and common, the services of the professional bidder were often dispensed with, and instead printed leaflets were circulated.

The curious horse wedding (proidas ceffylau) at which the man and his friends pursued the future bride to the church porch on horseback, and then returned home at full gallop, became obsolete before the end of the 19th century. Of the practices connected with death, the wake, or watching of the corpse, alone remains; but the habit of attending funerals, even those of strangers, is still popular with both sexes, so that a funeral procession in Cardiganshire is often a very imposing sight. Nearly all the old superstitions, once so prevalent, concerning the fairies (tŷfwyth leg) and fairy rings, goblins (bubchoed), and the teulu, or phantom funeral, are rapidly dying out; but in the corpse candle (cawnol corph), a mysterious light which acts as a death-portent and is traditionally connected with St David, are still found many believers.

Authorities.—Sir S. R. Meyrick, History and Antiquities of Cardiganshire (London, 1866); Rev. G. Eyre Evans, Cardiganshire and its Antiquities (Aberystwyth, 1903); E. K. Horsfall-Turner, Walks and Wanderings in County Cardigan (Bingley).

CARDINAL (Lat. cardinalis), in the Roman Church, the title of the dignitaries next to the pope. The cardinals constitute the council or senate of the sovereign pontiff, his auxiliaries in the general government of the Church; it is they who act as assistants to the Supreme Pontiff in the acts of government, and are responsible for the administration of the Church; they have the care of souls, and in the discharge of their duties are subject only to the Pope. This expression signifies clergy who are attached to their particular church in a stable relation, as a door is attached to a building by its hinges (see Thomassin, Vetus et nova discipl. vol. 1, lib. ii. cap. 113-115). Moreover, this sense is still preserved in the present day in the expressions in cardinatim, ecardinatim, which signify the act by which a bishop permanently attaches a foreign cleric to his diocese, or allows one of his own clergy to leave his diocese in order to belong to another. For a long time, too, the superior clergy, and especially the canons of cathedrals or the heads of important churches, were cardinales (see examples in Du Cange, Glossarium, s.v.). Gradually, however, this title was confined by usage to the Roman cardinals, until Pius V., by his constitution of the 15th of February 1568, reserved it to them exclusively.

The grouping of the cardinals into a body called the Sacred College, the College of Cardinals, is connected, in the case at least of cardinal priests, with the ancient presbyterium, which existed in each church from the earliest times. The Sacred College as such was not, however, definitively constituted until the uniting of the three orders of cardinals into a single body, the whole of which was to elect the pope; and this only took place in the 12th century. Up till that time the elements remained distinct, and there were separate classes: the "Roman" bishops, i.e. bishops of sees near Rome, presbyters of the "titles" (tituli) of Rome, and deacons of the Roman Church. Nowadays, the Sacred College is still composed of three orders or categories: cardinal bishops, cardinal priests, and cardinal deacons. But the process of evolution has not been the same in the case of all these orders.

Cardinal bishops are the bishops of suburban churches, situated in the immediate neighbourhood of Rome. Very early we find them assisting the pope in his ritual functions and in dealing with important business; they formed a kind of permanent synod (cf. the σύνοδος ἐκκλησιαστικός of Constantinople); and they also took the place of the pope in the ceremonies of the liturgy, excepting the most important ones, and especially in the service of the cathedral of Rome, the Lateran. A passage from the life of Stephen II. (A.D. 760), in the Liber Pontificalis (ed. Duchesne, i. p. 479), shows clearly that they were seven in number and served for a week in turn: Hic constitutus ut omni dominico die a septem Episcopis cardinaltibus hebdomadariis, qui in ecclesia Salvatoris (the Lateran) observant, missarum solemnias super alios Beati Petri celebrarentur. They were called "cardinal bishops of the Lateran church," as recorded by St Peter Damian in 1058 (Ep. 1, lib. ii.). Their sees are the same to-day as they were then: Osta, Porto, Santa Rufina (Sylvia Candida), Albano, Sabina, Tusculum (Frascati) and Palestrina. From time immemorial the bishop of Ostia has had the privilege of sacring the pope, and on this ground he enjoys the right of wearing the "pallium"; he is ex officio dean of the suburban bishops, and consequently dean of the Sacred College. His episcopal see having been in ruins for a long time, that of Velletri has been joined to it. The second rank belongs to the bishop of Porto, who is ex officio vice-dean of the Sacred College; his episcopal see being also in ruins Calixtus II. added it to that of Santa Rufina, thus reducing the number of suburban bishops and cardinal bishops to six; this number was adhered to by Sixtus V., and has not varied since.

The second order of cardinals is that of the cardinal priests. It represents and is a continuation of the ancient presbyterium; but in Rome the process of evolution was different from that in the other episcopal towns. In the latter, the division into parishes was but slowly accomplished; there is no authority for their existence before the year 1000; the bishop with the higher clergy, now developed into the chapter, were in residence at the cathedral, which formed, as it were, the one parish in the town. At Rome, on the contrary (and doubtless at Alexandria), certain churches, to which were attached certain districts, were at an early date entrusted to one or more priests. These churches, in which the liturgy was celebrated, or certain sacraments administered, were called tituli (titles). According to the Liber Pontificalis (ed. Duchesne, i. pp. 247-248), Bishop Sixtus I. (A.D. 47-54) had five, were already established as early as the 1st century; this seems hardly probable, but it was certainly the case in the 5th century. The priest serving one of these churches was the priest of that title, and, similarly, the church which he served was that priest's title. When several priests were attached to the same church, only the first, or principal one, had the title; he alone was the presbyter cardinalis. This practice explains how it is that the Roman presbyterium did not give rise to a cathedral chapter, but to cardinal priests, each attached to his title. As the higher
clergy of Rome gradually acquired a more important status, the relations between the cardinal priest and the church of which he bore the title became more and more nominal; but they have never entirely ceased. Even to-day every cardinal priest has his title, a church in Rome of which he is the spiritual head, and the name of which appears in his official signature, e.g. “Herbertus tituli sanctorum Andreæ et Gregorii sanctae romanæ ecclesiae presbyter cardinals Vaughan.” When the attachment of the cardinal priest to his title had become no more than a tradition, the number of cardinal titles, which in the 11th century had reached twenty-eight, was increased according to need, and it was held an honour for a church to be made titular. The last general re arrangement of the titular churches was begun by Clement VIII. and completed by Paul V.; Leo XIII. made a title of the church of San Vitale. To-day, according to the Gerarachia Pontificia the cardinal titles number fifty-three; since the highest possible number of cardinal priests is fifty, and this number is never reached, it follows that there are always a certain number of vacant titles. The first title is that of San Lorenzo in Lucina, and the cardinal priest of the oldest standing takes the name of “first priest,” protopresbyter. The third order of cardinals are the titular deaconas. For a long time the Roman Church, faithful to the example of the primitive church at Jerusalem (Acts vi.), had only seven deacons. Their special function was the administration of her temporal property, and particularly works of charity. Between them were divided at an early date the fourteen districts (regiones) of Rome, grouped two by two so as to constitute the seven ecclesiastical districts. Now the charitable works were carried on in establishments called diaconiae, adjoining churches which were specially appropriated to each diaconia. The connexion between the names (diaconus) and (diaconia) and the presence of a church in connexion with each diaconia gradually established for the deacons a position analogous to that of priests. In the 8th century Pope Adrian found sixteen diaconiae and founded two others (Lib. Pont. ed. Duchesne, i. p. 509); in the 12th century the cardinal deacons, who then numbered eighteen, were no longer distinguished by an ecclesiastical district, as they had formerly been, but by the name of the church connected with some diaconia (loc. cit. p. 364). By the time of Sixtus V. the connexion between a cardinal deacon and his diaconia was merely nominal. Sixtus reduced the number of cardinal deacons to fourteen; and this is still the number to-day. Except that his church is called a diaconia, and not a title, the cardinal deacon is in this respect assimilated to the cardinal priest; but he does not mention his diaconia in his official signature: e.g. “Joannes Henricus diaconus cardinals Newman.” There are at present sixteen diaconiae, the chief being that of Santa Maria in Via lata; the cardinal deacon of longest standing takes the name of “first deacon,” protodiaconus.

Cardinals can pass from one order, title or see to another, by a process of “option.” When a suburbanian sees fall vacant, the cardinals resident at Rome have the right of “option” for it in order of seniority — so say the popes — before any others receiving their promotion to it. In the same way cardinal deacons can pass after ten years to the order of priests, while retaining after their passage the rank in the Sacred College given them by the date of their promotion.

With the exception of the classes resulting from the order to which they belong, there are no distinctions between the rights of the various Cardinals. As to the ordination obligatory upon them, it is that indicated in the administration of the common property: this is the cardinal camerlengo or chamberlain (camerarius). His office is an important one, for during the vacancy of the Holy See it is he who exercises all external authority, especially that connected with the Conclave.

The number of the Cardinals reaches a total of 70: six cardinal bishops, fifty cardinal priests and fourteen cardinal deacons. This number was definitely fixed by Sixtus V. (constit. Postquam, 5th December 1586); but the Sacred College never reaches its full number, and there are always ten or so “vacant hats,” as the saying goes. Though the rule laid down by Sixtus V. has not been modified since, before him the number of cardinals was far from being constant. For a long time it varied in the neighbourhood of twenty; in 1331 John XXII. said that there were twenty cardinals; in 1378 they were reckoned at 23. Their number increased during the Great Schism because there were several rival obediences. The councils of Constance and Basel reduced the number of cardinals to 24; but it did not rest at that for long, and in the 16th century was more than doubled. In 1557 Leo X., in order to introduce strong supporters of himself into the Sacred College, created 31 cardinals at the same time. The highest number was reached under Pius IV., when the cardinals numbered as many as 76.

The composition of the Sacred College is subject to no definite law; but the necessity for giving a first representation to different national groups and the desire of having as cardinals the holders of a long past thrown open the Sacred College to representatives of the episcopate of the Catholic nations. From the 11th century onwards are to be found cases in which the pope summoned to its ranks persons who did not belong to the Roman Church, particularly abbots, who were not even required to give up the direction of their monasteries. In the following century occur a few cases of bishops being created cardinals without having to leave their see, and of cardinals upon whom were conferred foreign bishoprics (cf. Thomassin, loc. cit. cap. 114, n. 9.). Of the cardinals created by the popes of Avignon the majority were French, and in 1331 John XXII. remarks that 17 cardinals were French out of the 20 who then existed. The councils of Constance and Basel forbade that more than a third of the cardinals should belong to the same country. After the return of the popes to Rome and after the Great Schism, the ancient customs were soon resumed; the cardinals were for the most part Italians, the entire number of cardinals’ hats conferred on the other Catholic nations only amounting to a minority. The non-Italian cardinals, with rare exceptions, are not resident in Rome; together with the rank of cardinal they receive a dispensation from residing in curia; they are none the less, as cardinals, priests or deacons of the Roman Church.

The reform of the College of Cardinals inaugurated by the councils of Constance and Basel, though without much immediate success, was not only concerned with the number and nationality of the cardinals; it also dealt with conditions of age, learning and other qualifications: men of the most honourable character, aged not less than thirty, were to be chosen; at least a third were to be chosen from among the graduates of the universities; persons of royal blood and princes were not to be admitted in too great numbers, and lastly, relatives of the pope were to be set aside. Moreover, in order to secure the effectiveness of these reforms, selection of the new cardinals was to be made by the votes of the members of the Sacred College given in writing. This mode of control was perhaps excessive, and the reform consequently remained ineffective. Up to the middle of the 16th century there were still instances of excessive nepotism and an exaggerated estimate of temporal interests were rife. At last a real reform was effected. The council of Trent (sess. xxiv. cap. i. de reform.) requires for cardinals all the qualifications prescribed by law for bishops. Sixtus V. defined these still more clearly, and his regulations are still in force: a cardinal must, in the year of his promotion, be of the canonical age required for his reception into the order demanded by his rank. i.e. 22 for the diaconate, 23 for the priesthood and 30 for the episcopate, and if not already ordained he must take orders in the year of his appointment. Men of illegitimate birth are
excluded, as well as near relatives of the pope (with one exception) and of the cardinals, the personal qualities to be most sought for are learning, holiness and an honourable life. All these recommendations have been, on the whole, well observed, and are so better than ever in the present day. We may add that the religious orders have had a certain number of representatives, four, at least, in the Sacred College, since Sixtus V., several of whom, as we know, became popes. As to the cardinals' hats granted at the request of the heads of Catholic states, they are subject to negotiations analogous to those concerning nominations to the episcopate, though entailing no concordatary agreement, strictly speaking, on the part of the popes.

The creation of cardinals (to use the official term) is in fact nowadays the function of the pope alone. It is accomplished by the publication of the persons chosen by the pope in secret consistory (g.v.). No other formality is essential; and the papal states, in order to be considered as Roman, are excluded, or would be so treated in the future.

Similarly neither the consent nor the vote of the Sacred College is required. It is true that a Roman Ceremoniale of 1358 (Thomassin, loc. cit. cap. 114, n. 12) still left the power of the Sacred College to appoint its cardinal in the case of the Wednesday during Ember days, as to whether it is necessary to nominate new cardinals, and if so, how many: but this is only a survival of the ritual of the ancient form of ordination. The injunctions of the councils of Constance and Basel as also to the written vote of the cardinals became before very long a dead letter, but there still remains a relic of them. In the consistory, when the pope has nominated those whom he desires to raise to the purple, he puts to the cardinals present the question: "Quid vobis videtur?" The cardinals bend the head as a sign of their consent, and the pope then continues: "Itaque, auctoritate omnipotentis Dei, sanctorum Apostolorum Petri et Pauli, et Nostra, creams et publicamus sanctae Romanae Ecclesiae cardinales N. et N., etc."

The new dignitary, who has been warned of his nomination several weeks in advance by "biglietto" (note from the office of the secretary of state, is then officially informed of it by a ceremoniarius of the pope; he at once waits upon the pope, to whom he is presented by one of the cardinals. The pope first invests him with the rochet and red biretta, but the taking of the formal coat is left to the new cardinal's red hat takes place a few days later in a public consistory; while placing the hat on his head the pope pronounces the following words: "Ad laudem omnipotentis Dei et Sanctae Sedis ornamentum, accipe galarum rubrum, insignis singularis dignitatis cardinalis, per quod designatur quod usque ad mortem et svaegnini efiusio-nem inclusivo pro exaltatione sanctae fidei, pace et quiee populi christiani, augmento et statu sacrosanctae Romanae Ecclesiae, te intrepidum exhibere debas, in nomine Patris et Filii et Spiritus Sancti." While pronouncing the last words the pope makes the sign of the cross three times over the new cardinal.

The public consistory is immediately followed by a secret consistory, to accomplish the last ceremonies. The pope begins by closing the mouth of the new cardinal, who is led before him, as a symbol of the discretion he should observe; after this he bestows on him the cardinal's ring, assigns him title or diaconia, and finally, after going through the formality of consulting the Sacred College, finishes with the symbolic ceremony of the opening of the mouth, signifying the right and duty of the new cardinal to express his opinions and vote in the matters which it will fall to him to consider.

When the cardinals are resident abroad and appointed at the request of the heads of their state, a member of the Noble Guard is sent on the same day that the consistory is held to take the new dignitary the cardinal's "calotte"; after a few days the red biretta is brought to him by a Roman prelate, with the powers of an ablegatus; the biretta is conferred on him with great pomp by the head of the state. But the conferring of the red hat always takes place at the hands of the pope in a public consistory.

Sometimes, after nominating the cardinals, the pope adds that he also appoints a certain number of others, whose names do not appear in the act of nomination. These are known as "cardinals in pettro" (ital. in petto). This practice seems to go back to Martin V., who may have had recourse to this expedient in order to avoid the necessity of soliciting the votes of the cardinals; but for a long time past the popes have only resorted to it for quite other reasons. If the pope dies before making known the cardinals in petto, the promotion is not valid; if he publishes them, the cardinals take rank from the day on which they were reserved in pettro, the promotion acting retrospectively, even in the matter of emoluments. This method has sometimes been used by the popes to ensure to certain prelates who had merit, but were poor, the means of paying the expenses of their promotion. In March 1575 Pius IX. announced the nomination of several cardinals in pettro, whose names would be given in his will. It was pointed out to the pope that this posthumous publication would not be a pontifical act, and ran the risk of being contested, or even declared invalid; Pius IX. gave way before this reasoning, and published the names in a subsequent canonic publication (g.v.).

The dignity of the cardinals is a participation in that of the sovereign pontiff, and as such places them above all the other ecclesiastical dignitaries and prelates. This rank, however, has not always been assigned to them; but was attributed to the cardinal bishops before it was to the rest. Their common prerogative was definitely established when they became the sole electors of the pope, at a period when the papacy, under pontiffs like Innocent III., shone with its most brilliant lustre. For example, at the council of Lyons in 1245 all the cardinals took precedence of the archbishops and bishops. It was in 1245, or perhaps the year before, that Innocent IV. granted the cardinals the privilege of wearing the red hat; as to the scarlet robe which still forms their costume of ceremony, it was already worn by cardinals performing the functions of legate; and the use was soon extended to all. As to their civil relations, cardinals were assimilated by the Catholic kings to the rank of princes of the blood royal, cardinals being the highest in the Church, after the pope, just as princes of the blood royal are the first in the kingdom when the king. Of this, the most striking illustration is given by the ceremonial of the Order of the Garter. For we will mention only two of the real, although nowadays restricted, jurisdiction which they exercise over the churches forming their title or diaconia; and the official style of address conferred on them by Urban VIII. (16th of June 1630), of Eminence, Eminentissimus signore.

The most lofty function of the cardinals is the election of the pope (see CONCLAVE). But this function is necessarily intermittent, and they have many others to fulfil sede plena. On those rare occasions on which the pope officiates in person, they carry out, according to their respective orders, their former functions in the ritual. But they are, above all, the assistants of the pope in the administration of the Church; they fill certain permanent offices, such as those of chancellor, penitentiary, &c.; or again, temporary missions, such as that of legate a latere; they have seats in the councils and tribunals which deal with the affairs of the Church, and the Roman congregations of cardinals (see CURIA ROMANA).

CARDINAL VIRTUES—CARDS, PLAYING

CARDINAL VIRTUES (Lat. *cardo*, a hinge; the fixed point on which anything turns), a phrase used for the principal virtues on which conduct in general depends. Socrates and Plato (see *Republic*, iv. 427) take these to be Prudence, Courage (or Fortitude), Temperance and Justice. It is noticeable that the virtue of Benevolence, which has played so important a part in Christian ethics and in modern altruistic and sociological theories, is omitted by the ancients. Further, against the Platonic list it may be urged (1) that it is arbitrary, and (2) that the several virtues are not specifically distinct, that the basis of the division is unsound, and that there is overlapping. It is said that St Ambrose was the first to adopt the Platonic classification to Christian theology. By the Roman Catholic Church these virtues are regarded as *natural* as opposed to the *theological* virtues, Faith, Hope and Charity. Some authors, combining the two lists, have spoken of the Seven Cardinal Virtues. In English literature the phrase is found as far back as the *Cursor Mundi* (1300) and the *Aenibne of Inwit* (1340).

CARDING, the process of using the "card" (Lat. *carduus*, a thistle or teasel) for combing textile fibrous materials. The practice of carding is of such great antiquity that its origin cannot be traced. It consists in combing or brushing fibres until they are straight and placed in parallel lines; in doing this, imperfect fibres are separated from perfect ones, all impurities are removed, and the sound fibres are in condition for further treatment. The teasels once used have long given place to hand cards, and these in turn to what, in the rudest form, were known as "stock cards," namely, two wire brushes, each 4 in. broad by 12 in. long, and having teeth bent at a uniform angle. One was nailed upon a bench with the teeth sloping from the operator, the other was similarly secured upon a two-handled bar with the teeth sloping towards the operator. The material to be treated was thinly spread upon the fixed card, and the movable one drawn by hand to and fro over it. When sufficiently carded, a rod furnished with parallel projecting needles, called a "needle stick," was pushed amongst the card teeth to strip the fibres from the comb. This procured was rolled into a sliver and spun.

James Hargreaves, the inventor of the spinning jenny, suspended the movable comb by passing two cords over pulleys fixed in the ceiling and attached balance weights to opposite ends of the cords. This enabled him to lengthen the cards, to apply two or three to the same stock and to manipulate the top one with less labour, as well as to produce more and better work. In May of 1748, Daniel Bourn, of Lomeston, patented a machine in which four parallel rollers were covered with cards, and set close together. Fibres were fed to the first rotating roller, each in turn drew them from the preceding one, and a grid was employed to remove the carded material from the last roller. This introduced the principle of carding with revolving cylinders whose surfaces were clothed with cards working point to point. In December of the same year Lewis Paul, of Birmingham, the inventor of drawing rollers, patented two types of carding engines. In one, parallel rows of spaced cards were nailed upon a cylinder which was revolved by a winch handle. Beneath the cylinder a concave trough had a card fixed on the inside, as the fibres passed between the two series of teeth they were combed. This was the origin of flat-carding, namely, nailing strips of stationary cards upon transverse pieces of wood and adjusting the strips or flats by screws to the cylinder. In 1762, the father of Sir Robert Peel, with the assistance of Hargreaves, erected and used a cylinder carding engine which differed in some important particulars from Bourn's invention. But although roller-carding and flat-carding are the only principles in use at the present time, to Sir Richard Arkwright belongs the merit of introducing an automatic carding engine, for between the years 1773 and 1775 he combined the various improvements of his predecessors, entirely remodelled the machine, and added parts which made the operation continuous. So successful were these cards that some of them were in use at the beginning of the present century. Notwithstanding the numerous and important changes that have been made since Arkwright's time, carding remains essentially the same as established by him. (See COTTON-SPINNING MACHINERY.)

CARDIOID, a curve so named by G. F. M. M. Castillon (1708-1791), on account of its heart-like form (Gr. *kapδδα*, heart). It was mathematically treated by Louis Carré in 1705 and Koersma in 1741. It is a particular form of the limaçon (*q.v.*), and is generated in the same way. It may be regarded as an epicycloid in which the rolling and fixed circles are equal in diameter, as the inverse of a parabola for its focus, or as the caustic produced by the reflection at a spherical surface of rays emanating from a point on the circumference. The polar equation to the cardioid is \( r = a (1 + \cos \theta) \). There is symmetry about the initial line and a cusp at the origin. The area is \( \frac{\pi a^2}{2} \), i.e. \( \frac{1}{2} \) times the area of the generating circle; the length of the curve is \( 8a \).

(CA for a figure see LIMACON.)

CARDONA (perhaps the anc. *Udura*), a town of north-eastern Spain, in the province of Barcelona; about 57 m. N.W. of Barcelona, on a hill almost surrounded by the river Cardoner, a branch of the Llobregat. Pop. (1900) 28,515. Cardona is a picturesque and old-fashioned town, with Moorish walls and citadel, and a 14th-century church. It is celebrated for the extensive deposit of rock salt in its vicinity. The salt forms a mountain mass about 300 ft. high and 3 m. in circumference, covered by a thick bed of a reddish-brown clay, and apparently resting on a yellowish-grey sandstone. It is generally more or less translucent, and large masses of it are quite transparent. The hill is worked like a mine; pieces cut from it are carved by artists in Cardona into images, crucifixes and many articles of an ornamental kind.

CARDOON, *Cynara cardunculus* (natural order Compositae), a perennial plant from the south of Europe and Barbary, near a relation of the artichoke. The edible part, called the *chard*, is composed of the blanched and crisp stalks of the inner leaves. Cardoons are found to prosper on light deep soils. The seed is sown annually about the middle of May, in shallow trenches, like those for celery, and the plants are thinned out to 10 or 12 in. In Scotland it is generally sown in March or April: the seed singly in small plots, placing them in a mild temperature, and transplanting them into the trenches after they have attained a height of 8 or 10 in. Water must be copiously supplied in dry weather, both to prevent the formation of flower-stalks and to increase the succulence of the leaves. In autumn the leaf-stalks are applied close to each other, and wrapped round with bands of hay or straw, only the points being left free. Earth is then drawn up around them to the height of 15 or 18 in. Sometimes cardoons are blanched by a more thorough earthing up, in the manner of celery, but in this case the operation must be carried on from the end of summer. During severe frost the tops of the leaves should be defended with straw or litter. Besides the common and Spanish cardoons, there are the prickly-leaved Tours cardoon, the red-stemmed cardoon and the Paris cardoon, all of superior quality, the Paris being the largest and most tender. The common artichoke is also used for the production of chard.

CARDS, PLAYING. As is the case with all very ancient pastimes, the origin of playing-cards is obscure, many nations having been credited with the invention, but the generally accepted view is that they come from Asia. In the Chinese dictionary, *Ching-tse-tung* (1678), it is said that cards were invented in the reign of Ssūn-ho, 1120 A.D., for the amusement of his concubines. There is a tradition that cards have existed in India from time immemorial—very ancient ones, round in form, are preserved in museums—and that they were invented by the Brahmans. Their invention has also been assigned to the Egyptians, with whom they were said to have had a religious meaning, and to the Arabs. A very ingenious theory, founded on numerous singular resemblances to the ancient game of chess
CARDS, PLAYING

(chastranga, the four anas or members of an army), has been advanced that they were suggested by chess (see "Essay on the Indian Game of Chess," by Sir William Jones, in his Asiatic Researches, vol. ii.). The time and manner of the introduction of cards into Europe are matters of dispute. The 38th canon of the council of Worcester (1240) is often quoted as evidence of cards having been known in England in the middle of the 13th century; but the games de rege et regina there mentioned are now thought to have been a kind of mumming exhibition (Strutt says chess). No queen is found in the earliest European cards. In the wardrobe accounts of Edward I. (1278), Walter Stourton is paid 8s. 5d. ad opus regis ad ludendum ad quatuor reges, a passage which has been thought to refer to cards, but it is now supposed to mean chess, which may have been called the "game of four kings," as was the case in India (chaturangi). If cards were generally known in Europe as early as 1276, it is very remarkable that Petrarch, in his dialogue that treats of gaming, never once mentions them; and that, though Boccaccio, Chaucer and other writers of that time notice various games, there is not a single passage in them that can be fairly construed to refer to cards. Passages have been quoted from various works, of the 13th and 14th centuries, but the evidence leads to the supposition that the word card rendered cards has often been mistranslated or interpolated. An early mention of a distinct series of playing cards is the entry of Charles or Charlot Poupoutre, treasurer of the household of Charles VI. of France, in his book of accounts for 1392 or 1393, which runs thus: Donné à Jacquin Cringenstein, peintre, pour trois jeux de cartes, à ore et à diverses couleurs, ornés de plusieurs denises, pour porter devers le Seigneur Ro, pour son ébatment, cinquante-six sols parisis. This, of course, refers only to the painting of a set or pack of cards, which were evidently already well known. But, according to various conjectural interpretations of documents, the earliest date of the mention of cards has been pushed farther back by different authorities. For instance, in the account-books of Johanna, Duchess of Brabant, and her husband, Wenceslaus of Luxembourg, there is an entry, under the date of the 14th of May AD 1379, as follows: "Given to Monsieur and Madame four pears, two florins, value eight and a half moutons, wherewith to buy a pack of cards" (Quartspel met te coenen). This proves their existence in the Netherlands at least by 1379. In a British Museum MS, (Egerton, 2, 419) mention is made of a game of cards (qui ludus cartorum appelatur) in Germany in 1377. The safe conclusion with regard to their introduction is that, though they may possibly have been known to a few persons in Europe about the middle of the 14th century, they did not come into general use until about a half-century later. Whence they came is another question that has not yet been answered satisfactorily. If we may believe the evidence of Covelluzzo of Viterbo (15th century) that cards were introduced into Italy from Arabia. On the authority of a chronicle of one of his ancestors he writes: "In the year 1379 was brought into Viterbo the game of cards, which comes from the country of the Saracens, and is with them called naib." The Crusaders, who were invertebrate gamblers, may have been the instruments of their introduction (see Istoria della città di Viterbo, by F. Bassi, Rome, 1743). According to other authorities, cards came first to Spain from Africa with the Moors, and it is significant that, to this day, playing cards are called in Spain maoester (probably a corruption of the Arabic Nabī, prophet). Taking all the evidence into the statement of Covelluzzo, this fact would seem to prove the wide popularity of the game of naib, or cards, among the Arab tribes. The meaning of the word (prophet) has been suggested to refer to the fortune-telling function of cards, and the theory has been advanced that they were used by the Moorish gypsies for that purpose. Gypsies are, however, not known to have appeared in Spain before the 15th century, at a time when cards were already well known. In regard to the word naib, the Italian language still preserves the name naibi, playing cards.

Towards the end of the 14th century cards seem to have become common, for in an edict of the provost of Paris, 1397, working-people are forbidden to play at tennis, bowls, dice, cards or nine-pins on working-days. From an omission of any mention of cards in an ordinance of Charles V. in 1560, forbidding other games, it may be reasonably concluded that cards became popular in France between that date and the end of the century. In Italy it is possible that they were generally known at a somewhat earlier date. In the 15th century they were often the object of the attacks of the clergy. In 1423 St Bernardino of Siena preached a celebrated sermon against them at Bologna, in which, like the English Puritans after him, he attributed their invention to the devil. Cards in Germany are referred to in a manuscript of Nuremberg about 1384, which illustrates the rapid spread of the new game throughout Europe. In the earliest cards were generally rectangular or square, though sometimes circular.

Not long after their introduction, cards began to be used for other purposes than gaming. In 1500 a Franciscan friar, Thomas Munner, published an exposition of logic in the form of a pack of cards, and a pack invented in 1561 by Baptist Pendleton purported to convey a knowledge of grammar. These were followed by packs teaching geography and heraldry, the whole of which I have been called "scientific cards." Politics followed, and in England satirical and historical sets of cards were designed to reveal the plots of the Popish agitators. The first mention of cards in the New World is found in the letters of Herrera, a companion of Cortez, who describes the interest manifested by the Aztecs in the card games of the Spanish soldiers.

Early in the 15th century the making of cards had become a regular trade in Germany, whence they were sent to other countries. Cards were also manufactured in Italy at least as early as 1425, and in England before 1465; for by an act of parliament of 3 Edw. IV, the importation of playing cards is forbidden, in consequence, it is said, of the complaints of manufacturers that importation obstructed their business. No cards of undoubted English manufacture of so early a date have been discovered; and there is reason to believe, notwithstanding the act of Edward IV, that the chief supplies came from France or the Netherlands. In the reign of Elizabeth the importation of cards was a monopoly; but from the time of James I. most of the early cards made in England were of home manufacture. A duty was first levied on cards in the reign of James I.; since when they have always been taxed.

It has been much disputed whether the earliest cards were printed from wood-blocks. If so, it would appear that the art of wood-engraving, which led to that of printing, may have been developed through the demand for the multiplication of implements of play. The belief that the early card-makers or card-painters of Ulm, Nuremberg and Augsburg, from about 1418-1450, were also wood-engravers, is founded on the assumption that the cards of that period were printed from wood-blocks. It is, however, clear that the earliest cards were executed by hand, like those designed for Charles VI. Many of the earliest wood-cuts were coloured by means of a stencil, so it would seem that at the time wood-engraving was first introduced, the art of depicting and colouring figures by means of stencil plates was well known. There are no playing cards engraved on wood to which so early a date as 1423 (that of the earliest dated wood-engraving generally accepted) can be fairly assigned; and at this period there were professional card-makers established in Germany. It is probable that wood-engraving was employed to produce cuts for sacred subjects before it was applied to cards, and that there were hand-painted and stencilled cards before there were wood-engravings of saints. The German Briefmaler or card-painter probably progressed into the wood-engraver; but there is no proof that the earliest wood-engravers were the card-makers.

It is undecided whether the earliest cards were of the kind now common, called numeral cards, or whether they were tarocchi or tarots, which are still used in some parts of France, Germany and Italy, but the probability is that the tarots were the earlier. A pack of tarots consists of seventy-eight cards, four suits of
CARDUCCI and patronymic, better known as Carducci, the Spanish corruption of his Italian patronymic, was born in Florence, where he studied architecture and sculpture under Anmanati, and painting under Zuccaro. The latter master he accompanied to Madrid, where he painted the ceiling of the Escorial library, assisting also in the production of the frescoes that adorn the cloisters of that famous palace.

He was a great favourite with Philip III., and lived and died in Spain, where most of his works are to be found. The most celebrated of them is a Descent from the Cross, in the church of San Felipe el Real, in Madrid.

His younger brother VINCENZO (1568-1638), was born in Florence, and was trained as a painter by Bartolommeo, whom he followed to Madrid. He worked a great deal for Philip III. and Philip IV., and his best pictures are those he executed for the former monarch as decorations in the Prado. Examples of his work are preserved at Toledo, at Valladolid, at Segovia, and at several other Spanish cities. For many years he laboured in Madrid as a teacher of his art, and among his pupils were Giovanni Ricci, Pedro Obregon, Vela, Francisco Collantes, and other distinguished representatives of the Spanish school during the 17th century. He was also author of a dialogue or dialogue, De las Excelencias de la Pintura, which was published in 1633.

CARDUCCI, GISOUÉ (1836-1907), Italian poet, was born at Val-di-Castello, in Tuscany, on the 27th of July 1836, his father being Michele Carducci, a physician, of an old Florentine family, who in his youth had suffered imprisonment for his share in the revolution of 1831. Carducci received a good education. He began life as a public teacher, but soon took to giving private lessons. He was not long in gaining the help of young men, enthusiastic patriots in politics, and in literature bent on overthrowing the reigning romantic taste by a return to classical models. These aspirations always constituted the mainsprings of Carducci's poetry. In 1869 he became professor at Bologna, where, after in 1865 astonishing the public by a defiant Hymn to Satan, he published in 1868 Levia Gravina, a volume of lyrics which not only gave him an indisputable position at the head of contemporary Italian poets, but made him the head of a school of which the best Italian men of letters have been disciples, and which has influenced all. Several other volumes succeeded, the most important of which were the Decennalia (1871), the Nuove Poesie (1872), and the three series of the Odi Barbarie (1877-1889).

Carducci had been brought into more fraternal contact with the aims of the younger generation by the efforts of Angelo Sommaruga who became, about 1880, the publisher of a group of young unknown writers all destined to some, and a few to great, accomplishment. The period of his prosperity was a strange one for Italy. The first ten years of the newly constituted Kingdom of Italy were to the public in stupor: original contributions to literature had been scarce, and publishers had preferred bringing out inferior translations of not always admirable French authors to encouraging the original work of Italians—work which it must be confessed was generally mediocre and entirely lifeless. Sommaruga's creation, a literary review called La Cronaca Bizantina, gathered together such beginners as Giovanni Marra, Matilde Serao, Edoardo Scarfoglio, Guido Magnoni and Gabriele d'Annunzio. In order to obtain the sanction of what he considered an enduring name, the founder turned to Giosué Carducci, then living in retirement at Bologna, discontented with his fate, and still not generally known by the public of his own country. The activity of Sommaruga exercised a great influence on Giosué Carducci. Within the next few years he published the three admirable volumes of his Confessioni e Battaglie, the Ca' Ira sonnets, the Nuove Odi Barbarie, and a considerable number of articles, pamphlets and essays, which in their collected edition form the most living part of his work. His lyrical production, too, seemed to reach its perfection in those five years of tense, unrelenting toil. His Elogio di Odisse e poeti della Mauro, the Elegy on the urn of Percy Byshe Shelley, the ringing rhymes of the Intermezzo, in which he happily blended the satire of Heine with the lyrical form of his native poetry—all belong to this period, together with the essays on Leopardi and on Parini, the admirable discussions in defence of his Ca' Ira, and the pamphlet called Eterno Femminino regale, a kind of self-defence, undertaken to explain the origin of the Alcaic metre to the queen of Italy, which marks the beginning of the last evolution in Carducci's work (1881). The revolutionary spirits of the day, who had always...
looked upon Giosuè Carducci as their bard and champion, fell away from him after this poem written in honour of a queen, and the poet, wounded by the attitude of her party, wrote what he intended to be his defence and his programme for the future in pages that will remain amongst the noblest and most powerful of contemporary literature. From that time Carducci appears in a new form, evolved afterwards in his last Odes, Il Piemonte, Li Bicocca di San Giacomo, the Ode to the daughter of Francesco Crispi on her marriage, and the one to the church where Dante once prayed, All' Chiesetta dei Polenta, which is like the drawing-into itself of a warlike soul weary of its battle.

For a few months in 1876 Carducci had a seat in the Italian Chamber. In 1881 he was appointed a member of the higher council of education. In 1890 he was made a senator. And in 1906 he was awarded the Nobel prize for literature. He died at Bologna on the 16th of February 1907. By his marriage in 1859 he had two daughters, who survived him, and one son, who died in infancy.

The same qualities which placed Carducci among the classics of Italy in his earlier days remained consistently with him in later life. His thought flimsy limpid, serene, surged itself above an undulating surface, and his vigorous and Patriotic, the grandeur of work, the soul-satisfying power of justice, are the poet's dominant ideals. For many years the national struggle for liberty had forced the best there was in heart and brain into the atmosphere of political intrigue and from one battlefield to another; Carducci therefore found a poetry emasculated by the deviation into other channels of the intellectual virility of his country. On this mass of patriotic doggerel, of sickly, languishing sentimentality as insipid as it was inane, he grafted a poetry not often tender, but always violently felt and thrown into a mould of majestic form; not always quite expected or appreciated by his contemporaries, but never commonplace in structure; always high in tone and free in spirit. The adaptation of various kinds of Latin metres to the somewhat sinewless language he found at his disposal, whilst it might have been an effort of mere pedantry in another, was a life-giving and strengthening inspiration in his case. Another of his characteristics, which made him peculiarly precious to his country, is the fact that his poems form a kind of lyric record of the Italian struggle for independence. The tumultuous vicissitudes of all other nations, however, and the pageantry of the history of all times, have in turns touched his particular order of imagination.

The more important part of his critical work which belongs to this later period consists of his Conversazioni critiche, his Storia filosofica della letteratura Italiana, and a masterly edition of Petrarch. That he should have had the faults of his qualities is not remarkable. Being almost a pioneer in the world of criticism, his essays on the authors of other countries, though appearing in the light of discoveries to his own country, absorbed as it had hitherto been in its own vicissitudes, have little of value to the general student beyond the attraction of a style and in his unbounded admiration for the sculptural lines of antique Latin poetry he sometimes relapsed into that fascination by mere sound which is the snare of his language, and again and again his strength and vigour as a poet were blunted by the pursuit of other ends.

CARDWELL, EDWARD (1784–1861), English theologian, was born at Blackburn in Lancashire in 1784. He was educated at Brasenose College, Oxford (B.A. 1809; M.A. 1812; B.D. 1815; D.D. 1831), and after being for several years tutor and lecturer, was appointed, in 1814, one of the examiners to the university. In 1825 he was chosen Camden professor of ancient history; and during his five years' professorship he published an edition of the Ethics of Aristotle, and a course of his lectures on The Coinage of the Greeks and Romans. In 1831 he succeeded Archbishop Whately as principal of St.Alban's Hall. He published in 1837 a student's edition of the Greek Testament, and an edition of the Greek and Latin texts of the History of the Jewish War, by Josephus, with illustrative notes. But his most important labours were in the field of English church history. He projected an extensive work, which was to embrace the entire synodical history of the church in England, and was to be

founded on David Wilkin's Concilia Magnae Britanniae et Hiberniae. Of this work he executed some portions only. The work published was Documentary Annals of the Reformed Church of England from 1540 to 1715, which appeared working after its was followed by a History of Conferences, &c., connected with the Revision of the Book of Common Prayer (1840). On 1842 appeared Symonada, a Collection of Articles of Religion, Canons, and Proceedings of Convocation from 1547 to 1717, completing the series for that period. Closely connected with these works is the Reformatio Legum Ecclesiasticarum (1850), which treats of the efforts for reform during the reigns of Henry VIII., Edward VI., and Elizabeth. Cardwell also published in 1854 a new edition of Bishop Gibson's Synodus Anglicana. He was one of the best men of business in the university, and held various important posts, among which were those of delegate of the press, curator of the university galleries, manager of the Bible department of the press, and private secretary to successive chancellors of the university. He established the Wolvercote paper mill. He died at Oxford on the 23rd of May 1861.

CARDWELL, EDWARD CARDWELL, VISCOUNT (1813–1886), English statesman, was the son of a merchant of Liverpool, and was born on the 24th of July 1813. After a brilliant career at Oxford, where he gained a double first-class, he entered parliament as member for Clitheroe in 1842, and in 1845 was made secretary to the treasury. He supported Sir Robert Peel's free-trade policy, and went out of office with him. In 1847 he was elected for Liverpool, but lost his seat in 1852 for having supported the repeal of the navigation laws. He soon found another constituency at Oxford, and upon the formation of Lord Aberdeen's coalition ministry became president of the Board of Trade, although debarred by the jealousy of his Whig colleagues from a seat in the cabinet. In 1854 he carried, almost without opposition, a most important and complicated act consolidating all existing shipping laws, but in 1855 resigned, with his Peelite colleagues, upon the appointment of Mr Roebuck's Sevilla stop inquiry committee, declaring the offer of the chancellorship of the Exchequer pressed upon him by Lord Palmerston. In 1858 he made the famous presentation condemnation of Lord Ellenborough's speech made over that to Lord Canning on the affairs of Oudh, which for a time seemed certain to overthrow the Derby government, but which ultimately dissolved into nothing. He obtained a seat in Lord Palmerston's cabinet of 1859, and after filling the uncongenial post of secretary for Ireland and chancellor of the duchy of Lancaster (1861), became secretary for the colonies in 1864. Here he reformed the system of colonial defence, refusing to keep troops in the colonies during time of peace unless their expense was defrayed by the colonists; he also laid the foundation of federation in Canada and, rightly or wrongly, censured Sir George Grey's conduct in New Zealand. Resigning with his friends in 1866, he again took office in 1868 as secretary for war. In this post he performed the most memorable actions of his life by the abolition of purchase and the institution of the short service system and the reserve in the army, measures which excited more opposition than any of the numerous reforms effected by the Gladstone government of that period, but which after the South African war has been so generally approved.

On the resignation of the Gladstone ministry in 1874 he was raised to the peerage as Viscount Cardwell of Ellerbeck, but took no further prominent part in politics. His mental faculties, indeed, were considerably impaired during the last few years of his life, and he died at Torquay on the 15th of February 1886. He was not a showy, hardly even a prominent politician, but effected far more than many more conspicuous men. The great administrator and the bold innovator were united in him in an exceptional degree, and he allowed neither character to preponderate unduly.

CARDWELL, a town of Cardwell county, Queensland, Australia, on Rockingham Bay, about 800 m. direct N.W. by. N. of Brisbane. Pop. of town and district (1901) 3435. It has one of the best harbours in the state, easy of access in all weathers, with a depth ranging from 4 to 10 fathoms. Various minerals, including gold and tin, exist in the district; and there are preserve and sauce
factories, and works for meat extract and tinning. The dugong fishery is carried on, and the oil is extracted. There are large timber forests in the district, and much cedar is exported.

CAREW, George (d. about 1613), English diplomatist and historian, second son of Sir Wymond Carew of Antony, was educated at Oxford, entered the Inns of Court, and passed some years in continental travel. At the recommendation of Queen Elizabeth, who conferred on him the honour of knighthood, he was appointed secretary to Sir Christopher Hatton, and afterwards, having been promoted to a mastership in chancery, was sent as ambassador to the king of Poland. In the reign of James I. he was employed in negotiating the treaty of union with Scotland, and for several years was ambassador to the court of France. On his return he wrote a Relation of the State of France, with sketches of the leading persons at the court of Henry IV. It is written in the classical style of the Elizabethan age, and was appended by Dr. Birch to his Historical View of the Negotiations between the Courts of England, France and勃冯, from 1592 to 1617. Much of the information regarding Poland contained in De Thou's History of His Own Times was furnished by Carew.

CAREW, Richard (1555–1620). English poet and antiquary, was born on the 12th of July 1555, at Antony House, East Antony, Cornwall. At the age of eleven, he entered Christ Church, Oxford, and when only fourteen was chosen to carry on an extempore debate with Sir Philip Sidney, in presence of the earls of Leicester and Warwick and other noblemen. From Oxford he removed to the Middle Temple, where he spent three years, and then went abroad. By his marriage with Juliana Arundel in 1577 he added Cosworth to the estates he had already inherited from his father. In 1586 he was appointed high-sheriff of Cornwall; he entered parliament in 1594; and he served under Sir Walter Raleigh, then lord lieutenant of Cornwall, as treasurer. He became a member of the Society of Antiquaries in 1590, and was a friend of William Camden and Sir John Spelman. His great work is the Survey of Cornwall, published in 1602, and reprinted in 1769 and 1811. It still possesses interest, apart from its antiquarian value, for the picture it gives of the life and interests of a country gentleman of the days of Elizabeth. Carew’s other works are:—a translation of the first five Cantos of Tasso’s Jerusalem (1594), printed in the first instance without the author’s knowledge, and entitled Godfrey of Babylon, or the Recovery of Jerusalem; The Examination of Men’s Wits (1594), a translation of an Italian version of John Huarte’s Examen de Ingenios; and An Epistle concerning the Excellences of the English Tongue (1605). Carew died on the 6th of November 1620.

His son, Sir Richard Carew (d. 1643), was the author of a True and Readie Way to learn the Latin Tongue, by writers of three nations, published by Samuel Halsib in 1654.

CAREW, Thomas (1595–1657), English poet, was the son of Sir Matthew Carew, master in chancery, and his wife, Alice Ingpeny, widow of Sir John Rivers, lord mayor of London. The poet was probably the third of the eleven children of his parents, and was born at West Wickham in Kent, in the early part of 1595, for he was thirteen years of age in June 1608, when he matriculated at Merton College, Oxford. He took his degree of B.A. early in 1611, and proceeded to study at the Middle Temple. Two years later his father complained to Sir Dudley Carleton that he was doing little at the law. He was in consequence sent to Italy, as a member of Sir Dudley’s household, and when the ambassador returned from Venice, he seems to have kept Thomas Carew with him, for he is found in the capacity of secretary to Sir Dudley Carleton, at the Hague, early in 1615. From this office he was dismissed in the autumn of that year for levity and scandal; he had great difficulty in finding another situation. In August 1618 his father died, and Carew entered the service of Lord Herbert of Cherbury, in whose train he started for France in March 1619, and it is believed that he travelled in Herbert’s company until that nobleman returned to England, at the close of his diplomatic missions, in April 1624. Carew “followed the court before he was of it,” not receiving the definite appointment of gentleman of the privy chamber until 1628. While Carew held this office, he displayed his tact and presence of mind by stumbling and extinguishing the candle he was holding to light Charles I. into the queen’s chamber, because he saw that Lord St Albans had his arm round her majesty’s neck. The king suspected nothing, and the queen heaved favours on the poet. Probably in 1630, Carew was made “server” or taster-in-ordinary to the king. To this period may be attributed his close friendship with Sir John Suckling; Ben Jonson and Clarendon; the latter says that Carew was “a person of pleasant and facetious wit.” Donne, whose celebrity as a court-preacher lasted until his death in 1631, exercised a powerful if not entirely healthful influence over the genius of Carew. In February 1633 a masque by the latter, entitled Coelum Britannicum, was acted in the banqueting-house at Whitehall, and was printed in 1634. The close of Carew’s life is absolutely obscure. It was long supposed that he died in 1639, and this has been thought to be confirmed by the fact that the first edition of Henry’s Poems, printed in 1640, seems to have a posthumous character. But Clarendon tells us that “after fifty years of life spent with less severity and exactness than it ought to have been, he died with the greatest remorse for that licence.” If Carew was more than fifty years of age, he must have died in or after 1645, and in fact there were final additions made to his Poems in the third edition of 1651. Walton tells us that Carew in his last illness, being afflicted with the horrors, sent in great haste to “the ever-memorable” John Hales (1584–1656); Hales “told him he should have his prayers, but would by no means give him then either the sacrament or absolution.”

Carew’s poems, at their best, are brilliant lyrics of the purely sensual order. “They open to us, in his own phrase, “a mine of rich and pregnant fancy.” His metrical style was influenced by Jonson and his imagery still more clearly by Donne, for whom he had an almost servile admiration. His intellectual power was not comparable with Donne’s, but Carew had a lucidity and directness of linguistic utterance unknown to Donne. It is perhaps his greatest distinction that he is the earliest of the Cavalier song-writers by profession, of whom Rochester is the latest, poets who turned the disreputable incidents of an idle court-life into poetry which was often of the rarest delicacy and the purest melody and colour. The longest and best of Carew’s poems, “A Rapture,” would be more widely appreciated if the rich flow of its imagination were restrained by greater reticence of taste.

The best edition of Carew’s Poems is that prepared by Arthur Vincent in 1899. (E. G.)

CAREY, Henry (d. 1743). English poet and musician, reputed to be an illegitimate son of George Saville, marquis of Halifax, was born towards the end of the 17th century. His mother is supposed to have been a schoolmistress, and Carey himself taught music at various schools. He owed his knowledge of music to Olaus Linnert, and later he studied with Rosseingrave and Geminius. He wrote the words and the music of The Contrivances; or More Ways than One, a farce produced at Drury Lane in 1715. His Hanging and Marriage; or The Dead Man’s Wedding was acted at Lincoln’s Inn Fields in 1722. Chrononhotonthologos (1734), described as “The most Tragical Tragedy that ever was tragedized by any Company of Tragicians,” was a successful burlesque of the bombast of the contemporary stage. The best of his other pieces were A Wonder; or the Honest Yorkshireman (1735), a ballad opera, and the Dragon of Wanley (1737), a burlesque opera, the music of which was by J. F. Lampe. He was the author of Namby-Pamby, a once famous parody of Ambrose Philips’s verses to the infant daughter of the earl of Carteret. Carey is best remembered by his songs. “Sally in our Alley” (printed in his Musical Grammar) is a sketch drawn after following a shoemaker’s prentice and his sweethearts on a holiday. The present tune set to these words, however, is not the one written by Carey, but is borrowed from an earlier song, “The Country Lassie,” which is printed in The Merry Musician (vol. iii., c. 1716). It has been claimed for him that he was the author of “God save the King” (see National Anthems). He died in London on the 4th of
CAREY, H. C.—CARGILL

October 1743, and it was asserted, without justification, that he had committed suicide. Edmund Kean, the tragedian, was one of his great-grandchildren.

The complete edition of his poems is Poems on Several Occasions (1729). His dramatic works were published by subscription in 1743.

CAREY, HENRY CHARLES (1793-1879), American economist, was born in Philadelphia on the 15th of December 1793. At the age of twenty-eight he succeeded his father, Matthew Carey (1760-1839)—an influential economist, political reformer, editor, and publisher, of Irish birth, but for many years a resident of Philadelphia—as a member of the publishing firm of Carey & Lea, which was long the most conspicuous in America. He died in Philadelphia on the 13th of October 1879.

Among Mathew Carey's many writings had been a collection (1822) of Essays on Political Economy, one of the earliest of American treatises favouring protection, and Henry C. Carey's life-work was devoted to the propagation of the same theory. He retired from business in 1838, almost simultaneously with the appearance (1837-1840) of his Principles of Political Economy. This treatise, which was translated into Italian and Swedish, soon became the standard representative in the United States of the school of economic thought which, with some interruptions, has since dominated the tariff system of that country. Carey's first large work on political economy was preceded and followed by many smaller volumes on wages, the credit system, interest, slavery, copyright, &c.; and in 1858-1859 he gathered the fruits of his lifelong labours into The Principles of Social Science, in three volumes. This work is a most comprehensive as well as mature exposition of his views. In it Carey sought to show that there exists, independently of human wills, a natural system of economic laws, which is essentially beneficent, and of which the increasing prosperity of the whole community, and especially of the working classes, is the spontaneous result—capable of being defeated only by the ignorance or perversity of man resisting or impeding its action. He rejected the Malthusian doctrine of population, maintaining that numbers regulate themselves sufficiently in every well-governed society, and that their pressure on subsistence characterizes the lower, not the more advanced, stages of civilization. He denied the universal truth, for all stages of cultivation, of the law of diminishing returns from land.

His fundamental theocric position relates to the antithesis of wealth and value. Carey held that land, as we are concerned with its productivity in industrial life, is really an instrument of production which has been formed as such by man, and that its value is due to the labour expended on it in the past—though measured, not by the sum of that labour, but by the labour necessary under existing conditions to bring new land to the same stage of productivity. He studied the occupation and reclamation of land with peculiar advantage as an American, for whom the traditions of first settlement were living and fresh, and before whose eyes the process was indeed still going on. The difficulties of adapting a primitive soil to the work of yielding organic products for man's use can be lightly estimated only by an inhabitant of a country long under cultivation. It is, in Carey's view, the overcoming of these difficulties by arduous and continued effort that entitles the first occupier of land to his property in the soil. Its present value forms a very small proportion of the cost expended on it, because it represents only what would be required, with the science and appliances of our time, to bring the land from its primitive into its present state. Property in land is therefore only a form of invested capital—a quantity of labour or the fruits of labour permanently incorporated with the soil; for which, like any other capitalist, the owner is compensated by a share of the produce. He is not rewarded for what is done by the powers of nature, and society is in no sense defrauded by his sole possession. The so-called Ricardian theory of rent is a speculative fancy, contradicted by all experience. Cultivation does not in fact, as that theory supposes, begin with the best, and move downwards to the poorer soils in the order of their inferiority. The light and dry higher lands are first cultivated; and only when population has become dense and capital has accumulated, are the low-lying lands, with their greater fertility, but also with their morasses, inundations, and marshes, attacked and brought into occupation. Rent, regarded as a proportion of the produce, sinks, like all interest on capital, in process of time, but, as an absolute amount, increases. The share of the labourer increases, both as a proportion and an absolute amount. And thus the interests of these different social classes are in harmony. But, Carey proceeded to say, in order that this harmonious progress may be realized, what is taken from the land must be given back to it. All the articles derived from it are really separated parts of it, which must be restored on pain of its exhaustion. Hence the producer and the consumer must be close to each other; the products must not be exported to a foreign country in exchange for its manufactures, and thus go to enrich as manure a foreign soil. In immediate exchange value the landowner may gain by such exportation, but the productive powers of the land will suffer.

Carey, who had set out as an earnest advocate of free trade, accordingly arrived at the doctrine of protection: the "co-ordinating power in society must intervene to prevent private advantage from working public mischief." He attributed his conversion to this question to his intercourse with the effects of liberal and protective tariffs respectively on American prosperity. This observation, he says, threw him back on theory, and led him to see that the interview referred to might be necessary to remove (as he phrases it) the obstacles to the progress of younger communities created by the action of older and wealthier nations. But it seems probable that the influence of List's writings, added to his own deep-rooted and hereditary jealousy and dislike of English predominance, had something to do with his change of attitude (see PROTECTION).

CAREY, WILLIAM (1761-1834), English Oriental scholar, and the pioneer of modern missionary enterprise, was born at Paulerspury, Northamptonshire, on the 17th of August 1761. When a youth he worked as a shoemaker; but having joined the Baptists when he was about twenty-one, he devoted much of his time to village preaching. In 1785 he became pastor of a Baptist church in Leicester, and began those energetic movements among his fellow-religionists which resulted in the formation of the Baptist Missionary Society, Carey himself being one of the first to go abroad. On reaching Bengal in 1793, he and his companions lost all their property in the Hugli; but having received the charge of an indigo factory at Malda, he was soon able to prosecute the work of translating the Bible into Bengali. In 1799 he quitted Malda for Serampore, where he established a church, a school, and a printing-press for the publication of the Scriptures and philological works. In 1801 Carey was appointed professor of Oriental languages in a college founded at Fort William by the marquess of Wellesley. From this time to his death he devoted himself to the preparation of numerous philological works, consisting of grammars and dictionaries in the Marhatta, Sanskrit, Punjabi, Telinga, Bengali and Bhoutan dialects. The Sanskrit dictionary was unfortunately destroyed by a fire which broke out in the printing establishment. From the Serampore press there issued in his lifetime over 200,000 Bibles and portions in nearly forty different languages and dialects, Carey himself undertaking most of the literary work. He died on the 9th of June 1834.

See Lives by J. Culross (1881) and G. Smith (1884).

CARGILL, DONALD (1610-1658), Scottish Covenantant, was born in 1610. He was educated at St Andrews, and afterwards attached himself to the Protesters. After his appointment to one of the churches in Glasgow, he openly resisted the measures of the government. Compelled to remain at a distance from his charge, he ventured back to celebrate the Communion, and was arrested, but was liberated at the instance of some of his private friends. He was afterwards wounded at the battle of Bothwell Bridge, and fled to Holland, where he remained a few months. On his return he joined Richard Cameron in publishing the Sanquhar declaration, and boldly excommunicated the king and his officials. He was soon afterwards apprehended, and brought to Edinburgh, where he was beheaded on the 27th of July 1651.
CARGO

CARGO (Span. for “loading,” from Lat. carrus, car), a shipload, or the goods (or even, less technically, persons) carried on board a ship; and so, by analogy, a term used for any large amount. The maritime law affecting the cargo of a ship is dealt with in the articles AVERAGE, AFFREIGHTMENT, INSURANCE, SALVAGE, BOTTOMRY, LIEN; and the specialties of cargo-ships under SHIP.

CARIA, an ancient district of Asia Minor, bounded on the N. by Ionia and Lydia, on the W. and S. by the Aegean Sea, and on the E. by Lycia and a small part of Phrygia. The coast-line consists of a succession of great promontories alternating with deep inlets. The most important inlet, the Ceramic Gulf, or Gulf of Cos, extends inland for 70 m., between the great mountain promontory terminating at Myndus on the north, and that which extends to Cnidus and the remarkable headland of Cape Krio on the south. North of this is the deep bay called in ancient times the Gulf of Iassus (now known as the Gulf of Mendeliyah), and beyond this again was the deeper inlet which formerly extended inland between Miletus and Priene, but of which the outer part has been entirely filled up by the alluvial deposits of the Maeander, while the innermost arm, the ancient Latmus Gulf, is now a lake. South of Cape Krio again is the gulf known as the Gulf of Gora, with several subordinate inlets, bounded on the south by the rugged promontory of Cynossema (mod. Cape Alupo). Between this headland and the frontier of Lycia is the sheltered bay of Marmarica, noted in modern times as one of the finest harbours of the Mediterranean.

Almost the whole of Caria is mountainous. The two great masses of Cadmus (Baba-dagh) and Salbacum (Boz-dagh), which are in fact portions of the great chain of Taurus (see ASIA MINOR), form the nucleus to which the whole physical framework of the country is attached. From these lofty ranges there extends a broad tableland (in many parts more than 3000 ft. high), while it sends down offshoots on the north towards the Maeander, and on the west towards the Aegean. Of these ranges the summit of Mt Latmus alone reaches 4500 ft.

The coast is fringed by numerous islands, in some instances separated only by narrow straits from the mainland. Of these the most celebrated are Rhodes and Cos. Besides these are Syme, Telos, Nisyros, Calymnos, Leros and Patmos, all of which have been inhabited, both in ancient and modern times, and some of which excel in beauty. Of these Nisyros alone is of volcanic origin; the others belong to the same limestone formation with the rocky headlands of the coast. The country known as Caria was shared between the Carians proper and the Caunians, who were a wilder people, inhabiting the district between Caria and Lydia. They were not considered to be of the same blood as the Carians, and were, therefore, excluded from the temple of the Carian Zeus at Mylasa, which was common to the Carians, Lydians and Myssians, though their language was the same as that of the Carians proper.

Herodotus (i. 172) believed the Caunians to have been aborigines, the Carians having been originally called Leleges, who had been driven from the Aegean islands by the invading Greeks. This seems to have been a prevalent view among the Greek writers, for Thucydides (i. 8) states that when Delos was “purified” more than half the bodies found buried in it were those of “Carians.” Modern archaeological discovery, however, is against this belief; and the fact that Myssus, Lydus and Car were regarded as brothers indicates that the three populations who worshipped together in the temple of Mylasa all belonged to the same stock. Homer (II. x. 428-430) distinguishes the Leleges (g.v.) from the Carians, to whom is ascribed the invention of helmet-crests, coats of arms, and shield handles.

A considerable number of short Carian inscriptions has been found, most of them in Egypt. They were first noticed by Lepsius at Abu-Simbel, where he correctly inferred that they were the work of the Carian mercenaries of Psammetichus. The language, so far as it has been deciphered, is “Asiatic” and not Indo-European.

The excavations of W.R. Paton at Assarlik (Journ. Hell. Studies, 1887) and of F. Winter at Idrias have resulted in the discovery of Late-Mycenaean and Geometric pottery. Cari, however, figured but little in history. It was absorbed into the kingdom of Lydia, where Carian troops formed the bodyguard of the king. Cnidus and Halicarnassus on the coast were colonized by Dorians. At Halicarnassus (g.v.) the Mausoleum, the monument erected by Artemisia to her husband Mausolus, about 360 B.C., was excavated by Sir C. T. Newton in 1857-1858. Cnidus (g.v.) was excavated at the same time, when the “Cnidian Lion,” now in the British Museum, was found crowning a tomb near the site of the old city (C. T. Newton, History of Discoveries at Cnidus, Halicarnassus and Branchidae).

On the border-land between Caria and Lydia lay other Greek cities, Miletus, Priene, and Magnesia (see articles s.v.), colonized in early times by the Ionians. Inland was Tralles (mod. Aidin), which also had an Ionic population, though it never belonged to the Ionic confederacy (see TRALLES). The excavations of the English in 1868-1869, of the French under J. Rayet and A. Thomas in 1873, and more recently of the Germans under Th. Wiegand and Schrader in 1895-1898, have laid bare the site of the Greek Priene, and the same has been done for the remains of Magnesia ad Maeandrum by French excavators in 1842-1843 and the German expedition under Prof. Humann in 1861-1863. A German expedition under Th. Wiegand carried on excavations at Miletus (see articles on these towns).

In the Persian epoch, native dynasties established themselves in Caria and even extended their rule over the Greek cities. The last of them seems to have been Pixodarus, after whose death the crown was seized by a Persian, Oroctobates, who offered a vigorous resistance to Alexander the Great. But his capital, Halicarnassus, was taken after a siege, and the principality of Caria conferred by Alexander on Ada, a princess of the native dynasty, soon afterwards the country was incorporated into the Persian empire and then into the kingdom of Pergamum.

S.)

CARIBACO, or SAN FELIPE DE AUSTRIA, a town on the north coast of Venezuela, 40 m. east of the city of Cumaná at the head of the gulf bearing the same name. Pop. (1908, estimate) 7000. It stands a short distance up the Caraco river and its port is in a heavy swamp on the coast known as Puerto Sucre. The surrounding district produces cotton, tobacco, cacao, rice and fruit, and there is considerable trade through Puerto Sucre, although that port has no regular connexion with foreign ports.

CARIBBE ISLANDS, a name chiefly of historical importance, sometimes applied to the whole of the West Indies, but strictly comprehending only the chain of islands stretching from Porto Rico to the coast of South America. These are also known as the Lesser Antilles, and the bulk of them are divided into the two groups of the Leeward and Windward Islands.

CARIBS, the name, used first by Columbus (from Cariba, said to mean “a valiant man”), of a South American people, who, at the arrival of the Spanish, occupied parts of Guiana and the lower Orinoco and the Windward and other islands in what is still known as the Caribbean Sea. They were believed to have had their original home in North America, spreading thence through the Antilles southward to Venezuela, the Guianas, and north-east Brazil. This view has been abandoned, as Carib is neither the Bakaír or Nahualus, an archaic type of Carib-speaking and has been identified by German explorers in the very heart of Brazil. It may thus be assumed that the cradle of the race was the centre of South America; their first migrating movements being to Guiana and the Antilles. A cruel, ferocious and warlike people, they made a stout resistance to the Spaniards. They were cannibals, and it is to them that we owe that word, Columbus’s Caribal being transformed into Cannibal in apparent reference to the canine voracity of the Caribs. They are physically by no means a powerful race, being distinguished by slight figures with limbs well formed but
lacking muscle, and with a tendency to be pot-bellied, due apparently to their habit of drinking pauwori (liquor prepared from the cassava plant) in great quantities. Their colour is a red cinnamon, but varies with different tribes. Their hair is thick, long, very black, and generally cut to an even edge, at right angles to the neck, round the head. The features are strikingly Mongoloid. Among the true Caribs a 2-in. broad belt of cotton is knitted round each ankle, and just below each knee of the young female children. All body-hair in both sexes is pulled out, even to the eye-brows. Among the women the lower lips are often pierced, pins of wood being passed through and forming a sort of cheveux de frise round the mouth. Sometimes a bell-shaped ornament is hung by men to a piece of string passed through the lower lip. The Carib government was patriarchal. Though the women did most of the hard work, they were kindly treated. Polygamy prevailed. Very little ceremony attended death. The Caribs of the West Indies, known as “Red” and “Black,” the first pure, the second mixed with negro blood, after a protracted war with the British were transported in 1706 to the number of 3000 from Dominica and St Vincent to the island of Ruatan near the coast of Honduras. A few were subsequently allowed back to St Vincent, but the majority are settled in Honduras and Nicaragua.

CARICATURE (Ital. caricatura, i.e. “ritratto ridicolo,” from caricare, to load, to charge; Fr. charge), a general term for the art of applying the grotesque to the purposes of satire, and for pictorial and plastic ridicule and burlesque. The word “caricatura” was first used as English by Sir Thomas Browne (1605-1682), in his Christian Morals, a posthumous work; it is next found, still in its Italian form, in No. 537 of the Spectator; it was adopted by Johnson in his dictionary (1755), but does not appear in Bailey’s dictionary, for example, as late as 1773; and it only assumed its modern guise towards the end of the 18th century, when its use and comprehension became general. Little that is not conjectural can be written concerning caricature among the ancients. Few traces of the comic are discoverable in Egyptian art—such papyri of a satirical tendency as are known to exist appearing to belong rather to the class of ithyphallic drolleries than to that of the ironical grotesque. Among the Greeks, though few and dubious data are extant, it seems possible that caricature may not have been altogether unknown. Their taste for pictorial parody, indeed, has been sufficiently proved by plentiful discoveries of pottery painted with burlesque subjects. Aristotle, moreover, who disapproved of grotesque art, condemns in strong terms the pictures of a certain Paupon, who, alluded to by Aristophanes, and the subject of one of Lucian’s anecdotes, is hailed by Chrysippe the dono che caricaturi. That the grotesque in graphic art conceived in the true spirit of intentional caricature was practised by the Romans is evident from the curious frescoes uncovered at Pompeii and Herculeanum; from the mention in Pliny of certain painters celebrated for burlesque pictures; from the curious fantasies graven in gems and called Grylli; and from the number of ithyphallic caprices that have descended to modern times. But in spite of these evidences of Greek and Roman caricature, in spite of the famous comic statuettes of Caracalla, and of the more famous graffito of the Crucifixion, the caricaturists of the old world must be sought for, not among its painters and sculptors, but among its poets and dramatists. The comedies of Aristophanes and the epigrams of Martial were, to the Athens of Pericles and the Rome of Domitian, what the etchings of Gillray and the lithographs of Daumier were to the London of George III. and the Paris of the Citizen King. During the middle ages a vast mass of grotesque material was accumulated, but selection becomes even more difficult than with the scarce relics of antiquity. With the building of the cathedrals originated a new style of art; a strange mixture of memories of paganism and Christian imaginings was called into being for the adornment of those great strongholds of urban Catholicism, and in this the coarse and brutal materialism of the popular humour found its largest and freest expression. On misal-marge and sign-board, on stall and entablature, in gargoyles and initial, the grotesque displayed itself in an infinite variety of forms. The import of this inextricable tangle of imagery, often obscene and horrible, often quaint and fantastic, is difficult, if not impossible, to determine. We recognize the prevalence of three great popular types or figures, each of which may be credited with a satirical intention—of Reynard the Fox, the hero of the famous medieval romance; of the Devil, that peculiarly medieval antithesis of God; and of Death, the sarcastic and irreverent skeleton. The popularity of the last is evidenced by the fact that no fewer than forty-three towns in England, France and Germany are enumerated as possessing sets of the Dance of Death, that grandiose all-levelling series of caprices in the contemplation of which the middle ages ages found so much consolation. It was reserved for Holbein (1498-1544), seizing the idea and resuming all that his contemporaries thought and felt on the subject, to produce, in his fifty-three magnificent designs of the Danse Macabre, the first and perhaps the greatest set of satirical moralities known to the modern world.

It is in the tumult of the Renaissance, indeed, that caricature in its modern sense may be said to have been born. The great popular movements required some such vehicle of comment or censure; the perfection to which the arts of design were attaining supplied the means; the invention of printing ensured its dissemination. The earliest genuine piece of graphic irony that has been discovered is a caricature (1490) relating to Louis XII. and his Italian war. But it was the Reformation that produced the first full crop of satirical ephemerae, and the heads of Luther and Alexander VI. are therefore the direct ancestors of the masks that smirk and frown from the “cartoons” of Punch and the Charivari. Fairly started by Lucas Cranach, a friend of Luther, in his Passionale of Christ and Antichrist (1521), caricature was naturalized in France under the League, but only to pass into the hands of the Dutch, who supplied the rest of Europe with satirical prints during the whole of the next century. A curious reaction is visible in the work of Pieter Breughel (1510-1550) towards the grotesque diablerie and macaberesque morality of medieval art, the last original and striking note of which is caught in the compositions of Jacques Callot (1595-1633), and, in a less degree, in those of his followers, Stefano della Bella (1610-1664) and Salvador Rosa (1615-1673). On the other hand, however, Callot, one of the greatest masters of the grotesque that ever lived, in certain of his Caprices, and in his two famous sets of prints, the Miseres de la guerre, may be said to anticipate certain productions of Hogarth and Goya, and so to have founded the modern school of ironic genre.

In England one of the earliest caricatures extant is that in the margin of the Forest Roll of Essex, 5, ed. 1, now at the Record Office; it is a grotesque portrait of “A Aaron fil Diabole” (Aaron, son of the devil), probably representing Cok, son of Aaron. It is dated 1277. Another caricature, undated, appears on a Roll containing an account of the tallages and fines paid by Jews, 17. Henry III., belonging to 1233 (Exch. of Receipts, Jews’ Roll, No. 8). It is an elaborate satirical design of Jews and devils, arranged in a pediment. During the 16th century, caricature can hardly be said to have existed at all—a grotesque of Mary Stuart as a mermaid; a pen and ink sketch of which is yet to be seen in the Rolls Office being the only example of it known. The Great Rebellion, however, acted as the Reformation had done in Germany, and Cavaliers and Roundheads caricatured each other freely. At this period satirical pictures usually did duty as the title-pages of scurrilous pamphlets; but one instance is known of the employment during the war of a grotesque allegory as a banner, while the end of the Commonwealth produced a satirical pack of playing cards, probably of Dutch origin. The Dutch, indeed, as already has been stated, were the great purveyors of pictorial satire at this time and during the early part of the next century. In England the wit of the victorious party was rather vocal than pictorial; in France the spirit of caricature was sternly repressed; and it was from Holland, bold in its republican freedom, and rich in painters and etchers, that issued the flood of prints and medals which illustrate, through cumbrous allegories and elaborate
symbolization, the principal political passages of both the former countries, from the Restoration (1660) to the South Sea Bubble (1720). The most distinguished of the Dutch artists was Romain de Hoogh (1658-1720), a follower of Callot, who, without any of the weird power of his master, possessed a certain skill in grouping and faculty of grotesque suggestiveness that made his point a most useful weapon to William of Orange during the long struggle with Louis XIV.

The 18th century, however, may be called emphatically the age of caricature. The spirit is evident in letters as in art; in the fierce grotesques of Swift, in the coarser charges of Smollett, in the keen ironies of Henry Fielding, in the Aristocratic tendency of Foote's farces, no less than in the masterly moralities of Hogarth and the truculent satires of Gillray. The first event that called forth caricatures in any number was the prosecution (1710) of Dr Sacheverell; most of these, however, were importations from Holland, and only in the excitement attendant on the South Sea Bubble, some ten years later, can the English school be said to have begun. Starting into activity being with the ministry of Walpole (1746), it flourished under that statesman for some twenty years,—the "grotesquists," as its prints were named, graphically enough, often circulating on fans. It continued to increase in importance and audacity till the reign of Pitt (1757-1761), when its activity was somewhat abated. It rose, however, to a greater height than ever during the rule of Bute (1761-1763), and since that time its influence has extended without a check. The artists whose combinations amused the public during this earlier period are, with few exceptions, but little known and not greatly esteemed. Among them were two amateurs, Dorothy, wife of Richard Boyle, 3rd Earl of Burlington, and General George Townshend (posthumous 1st Marquess Townshend); Goupjy, Boizard and Liotard were Frenchmen; Vanderghucht and Vanderbank were Dutchmen. This period witnessed also the rise of William Hogarth (1697-1764). As a political caricaturist Hogarth was not unsuccessful, save in a few isolated examples, as in the portraits of Wilkes and Churchill; but as a moralist and social satirist he has not yet been equalled. The publication, in 1732, of his Modern Midnight Conversation may be said to mark the beginning of caricature in this country. Mention must also be made of Paul Sandby (1725-1800), who was not a professional caricaturist, although he joined in the pictorial hue-and-cry against Hogarth and Lord Bute, and who is best remembered as the founder of the English school of water-colour; and of John Collet (1725-1788), said to have been a pupil of Hogarth, a kindly and industrious humorist, rarely venturing into the arena of politics. During the latter half of the century, however, political caricature began to be somewhat more skillfully handled than of old by James Sayer, a satirist in the pay of the younger Pitt, while social grotesques were pleasantly treated by Henry William Bunbury (1750-1812) and George Moutard Woodward. These were, however, interesting as they are, are dwarfed into insignificance by the great figure of James Gillray (1757-1815), in whose hands political caricature became almost epic for grandeur of conception and far-reaching suggestiveness. It is to the works of this man of genius, indeed, and (in a less degree) to those of his contemporary, Thomas Rowlandson (1756-1827), an artist of great and varied powers, that historians must turn for the popular reflection of all the political notabilizes of the end of the 18th and the beginning of the 19th centuries. England may be said to have been the chosen home of caricature during this period. In France, timid and futilile under the Monarchy, it had assumed an immense importance under the Revolution, and a cloud of hideous pictorial libels was the result; but even the Revolution left no such notes through its own artists, though Fragonard (1732-1806) himself was of the number, as came from the gravers of Gillray and Rowlandson. In Germany caricature did not exist. Only in Spain was there to be found an artist capable of entering into competition with the masters of the satirical grotesque of whom England could boast. The works of Francesco Goya y Lucientes (1746-1828) are described by Théophile Gautier as "a mixture of those of Rembrandt, Watteau, and the comical dreams of Rabelais," and Champfleury discovers analogies between him and Honoré Daumier, the greatest caricaturist of modern France.

The satirical grotesque of the 18th century had been characterized by a sort of grandiose brutality, by a certain vigorous obscenity, by a violence of expression and intention, that appear monstrous in these days of reserve and restraint, but that doubtless sorted well enough with the strong party feelings and fierce political passions of the age. After the downfall of Napoleon (1815), however, when strife was over and men were weary and satisfied, a change in manner and manner came over the caricature of the period. In connection with this change, the name of George Cruikshank (1792-1878), an artist who stretches his hands on the one side towards Hogarth and Gillray, and on the other towards Tenniel, deserves honourable mention. Those of Cruikshank's political caricatures which were designed for the squibs of William Hone (1799-1842) are, comparatively speaking, uninteresting; his ambition was that of Hogarth— the production of "moral comedies." Much of his work, therefore, may be said to form a link in the chain of development through which has passed that ironical art to whose influence has already been made. In 1820, however, began to appear the famous series of lithographs, signed H. B., the work of John Doyle (1798-1868). These jocularitys are interesting otherwise than politically; thin and weakly as they are, they inaugurated the style of later political caricature. In France, meanwhile, with the farcical designs of Edme Jean Pigal (1794) and the realistic sketches of Henri Monnier (1805-1872), the admirable portrait-busts of Jean Pierre Dantan the younger (1800-1869) and the fine military and low-life drolleries of Nicolas Toussaint Charlet (1792-1845) were appearing. Up to this date, though journalism and caricature had sometimes joined hands (as in the case of the Craftsman and the Anti-Jacobin, and particularly in Les Révolutions de France et de Brabant and Les Actes des Apôtres), the alliance had been but brief; it was reserved for Charles Philipon (1802-1862), who may be called the father of comic journalism, to make it lasting. The foundation of La Caricature, by Philipon in 1831, suppressed in 1835 after a brief but glorious career, was followed by Le Charivari (December 1832), which is perhaps the most renowned of the innumerable enterprises of this extraordinary man. Among the artists he assembled round him, the highest place is held by Honoré Daumier (1808-1879), a draughtsman of great skill, and a caricaturist of immense vigour and audacity. Another of Philipon's band was Sulpice Paul Chevalier (1801-1866), better known as Gavarni, in whose hands modern social caricature, advanced by Cruikshank and Charlet, assumed its present guise and became elegant. Mention must also be made of Grandville (J. I. I. Gérard) (1803-1847), the illustrator of La Fontaine, and a modern patron of the medieval skeleton; of Charles Joseph Traviés de Villers, the father of the famous hunchback "Mayeux"; and of Amedée de Noé, or "Cham," the wittiest and most ephemeral of pictorial satirists. In 1840 the pleasures of "H. B." having come to an end, there was found in imitation of this enterprise of Philipon, the comic journal which, under the title of Punch, or the London Charivari, has since become famous all over the world. Among its early illustrators were John Leech (1817-1864) and Richard Doyle (1824-1883), whose drawings were full of the richest grotesque humour.

In 1862 Carlo Pellegrini, in Vanity Fair, began a series of portraits of public men, which may be considered the most remarkable instances of personal caricature in England.

For the later developments of caricature, it is convenient to take them by countries in the following sections:

Great Britain.—During the later 19th century the term caricature, sometimes used in connexion with the drama, covered almost every form of humorous art, from the pictorial wit and wisdom of Sir John Tenniel to the weird grotesques of Mr S. H. Sime, from the gay pleasureats of Randolph Caldecott to the graceful but sedate figurines of Mr Walter Crane. It is made to embrace alike the social studies, satirical and sympathetic, of Du Maurier and Keene, the political cartoons of Mr Harry Furniss and Sir F. C. Gould, the unexcutating likenesses of "Ape," "Spy," and "Max," the
subtle conveys of Mr Linley Sambourne, the whimsicals of Mr E. T. Reed, the exuberant burlesques of Mr J. F. Sullivan, the frank buffooneries of W. G. Baxter. Of these diverse forms of graphic humor, some have no other object than to amuse, and therefore do not contribute to the world’s knowledge. But the work of Mr Sambourne has the note of originality and extravagance too; while that of "Spy" (Mr Leslie Ward) in Vanity Fair, if it does not rival the occasional brilliancy of his predecessor "Ape" (Carlo Pellegrini, 1839-1890), makes it clear that he has more wit and satirical power than the master, and he is content if his pencil evokes the comment, "How ridiculously like!" Caricature of this kind is merely an entertainment. Here we are concerned rather with those branches of caricature which come closest to reality and closest to the actual life we live. In treating of recent caricature of this kind, we must give the first place to Punch. Mr Punch’s outlook upon life has not changed much since the "sevenities of the last century," and he has made himself felt most appreciably in the days of John Leech and Richard Doyle. Their successors but follow in their steps. In their work, says a German critic, is to be found no vestige of the "sour bilious temper of John Leech," nor the "lively spirit" of Du Maurier. Charles Keene (1823-1861) and Du Maurier (1834-1896), he declares, are not caricaturists or satirists, but amiable and tenderly grave observers of life, friendly optimists. The characterization is truer of Keene, perhaps, than of Du Maurier. Du Maurier’s work is usually more successful, almost without exception they make you smile or laugh. In many of Du Maurier’s, on the other hand, there is an underlying seriousness. While Keene looks on at life with easy tolerance, an amused spectator, Du Maurier sees it all too clearly and with a pathetic, taking infinite delight in what is pretty and gay and charming, but at the same time seeing the sordid and the ugly. Thus while Keene takes things disparately as they come, seeing only the outside of things, Du Maurier is attacking some new phase of snobbishness or philistinism or cant. For all his kindliness in depicting congenial scenes, he is at times unrelenting a satirist as Rowlandson. The other Punch artists, whether of Keene’s or Du Maurier’s school, are not so well as the "cartoonist". Phil May (d. 1903), a modern Touchstone, is less easily Classified. Though he wears the cap and bells, he is more of a photographe than a humorist in the sense of his street-boys and "gutter-snipes." He is, however, a jester primarily: an artist too, of high achievement. Two others stand out as masters of the art of social caricature—Frederick Barnard and Mr J. F. Sullivan. Barnard’s illustrations to Dickens, like his original sketches, have a lively humour—the humour of irrepressible high spirits—and endless invention. High spirits and invention are characteristics also of Mr Sullivan. It is at the British arts that Mr Sullivan is most widely patronized by the cartoon and the plumper who outstays his welcome—that he aims his most boisterous fun. He rebels, too, delightfully, against red tape and all the petty tyrannies of officialdom. In political caricature Sir John Tomlinson, Mr W. H. Reiss, and Mr B. W. Newman are also worthy of mention. While the 5th Earl of Aberdeen, and Bismarck’s fall from power, the tragedy of Khartum—to subjects such as these, worthy of a great painter, Tenniel has brought a classic simplicity and a sense of dignity unknown previously to caricature. He is, in fact, more a Caricaturist in the true meaning of the word, than in those ingenious parables in which the British Lion and the Russian Bear, John Chinaman, Jacques Bonhomme and Uncle Sam play their part—or in the ever-changing scenes of the great parliamentary Comedy—or in some dramas of the next world. What Mr Sambourne has been able to do in the symbolic personalities of Gog and Magog, Father Thames and the Fog Fiend, the duke of Mudford and Mr Punch himself, have become familiar. Subjects similar to these have been treated alike by Mr Tenniel in his political work, and the plumper who outstays his welcome—that he aims his most boisterous fun. He rebels, too, delightfully, against red tape and all the petty tyrannies of officialdom. In political caricature Sir John Tomlinson, Mr W. H. Reiss, and Mr B. W. Newman are also worthy of mention. While the 5th Earl of Aberdeen, and Bismarck’s fall from power, the tragedy of Khartum—to subjects such as these, worthy of a great painter, Tenniel has brought a classic simplicity and a sense of dignity unknown previously to caricature. modern life. His work has the value, no doubt, of deep and various meaning, but it has also intrinsic artistic worth. M. Willette is, in fact, the ideal delineator of the more voluptuous and highly spiced aspects of contemporary life. "Caran d'Ache," a native of Moscow, born in 1848, was flung from the Caricatures of the last generation, made his début with the illustrated poem "The Peasant and the Miller," and won a world-wide reputation with the following works: Peter-lined, Die Fronten, Max and Moritz, Der heilige Antonius, Maler Klekkel, Baldwin von Wied, and Fliegende Blätter. His success is due to the wit and the humorous style of his work. His drawing is skillful and his style is based on the characteristic German school; they made fun of modern novelists. Hermann Schlüttgen, Meggendorfer, H. Vogel-Plauen, Réné Reimicke, Adolf Hengeler and Fritz Wahle are the sons of the self-satisfied, triumphing in its satirical pages, with a marked sense for the work with the pencil. Men, animals, trees, objects, are endowed by him with a mysterious life of their own. Without the help of any verbal joke, he achieves the funniest results simply by selecting the comical side of everything. His drawings are caricature in the strict sense of the word, its principle being the exaggeration of some natural characteristic. The new generation of contributors to Fliegende Blätter do not work on these lines and are marked by a general tendency to simplify in the history of German manners. Its pages are a permanent and authentic source to see the social aspects of Germany during the last quarter of the 19th century onwards. At the same time a falling-off in the brilliancy of this period was perceptible. Its fun became domestic and homely, and a Francophile or a Whiggish and an art critic would call the actors of the consdile humaine in a series of drawings. Jean Veber loves fantastic subjects, the gnomes of fairy-tales and myths: but he has a biting irony for contemporary history, as in the Bucher's Shop, where Bismarck is the blood-stained butcher, and a peasant is a rich landowner. M. Jank and a whimsical humorist with the pencil. He shows us monstrous women, fabulously hideous, drawing them with a sort of realism which is droll by sheer ugliness. Henri de Toulouse-Lautrec starts us by extra-ordinary creatures of the whole class of savages; M. Heo: he has an inimitable series of sketches of Mme Yvette Guilbert when she was at her thinnest. M. Felix Vallotton reproduces crows in bowls of black with a Japanese use of the brush. M. C. G. Morot, a notable character of the period, has illustrated works; he contributed to Le Rire, Le Sourire, Le Pompon, L'Assiette au Beurre, &c., drawing the two types he most affects: the fashionable world and soldiers. M. Biele, Capelli and many more might be enumerated, but it is impossible to chronicle all the clever humorous artists of the illustrated papers.

It is the frequent habit of French caricaturists to employ a nom-de-guerre. We therefore give here a list of the genuine names represented by the pseudonyms used above, together with others familiar to the public:

Germany.—During the later 19th century German caricature flourished principally in the comic papers Klaradateschen of Berlin and Fliegende Blätter of Munich; the former a political paper with little artistic value, in which the ideas alone are clever, whilst the illustrations are merely a more or less clumsy adjunct to the text, while the Fliegende Blätter, on the contrary, has artistic merit as well as wit. Wilhelm Busch (b. 1832), the most brilliant German caricaturist of the last generation, made his début with the illustrated poem "The Peasant and the Miller," and won a world-wide reputation with the following works: Peter-lined, Die Fronten, Max and Moritz, Der heilige Antonius, Maler Klekkel, Baldwin von Wied, and Fliegende Blätter. Busch stands alone among the caricaturists of his nation, inasmuch as with the author and the illustrator of these works, his witty doggerel supplying Germany with household words. The drawings that accompany the text are amazing for the skill and directness with which they support the words. The width of the margins and the use of disinclined peculiarities are enough to set before us figures of intensely comic aspect. This distinguishes Busch from Adolf Oberländer (1845), who became the chief draughtsmen on Fliegende Blätter. Busch's drawings would have no meaning without his text, and even the latter does not always work with the pencil. Men, animals, trees, objects, are endowed by him with a mysterious life of their own. Without the help of any verbal joke, he achieves the funniest results simply by selecting the comical side of everything. His drawings are caricature in the strict sense of the word, its principle being the exaggeration of some natural characteristic. The new generation of contributors to Fliegende Blätter do not work on these lines and are marked by a general tendency to simplify in the history of German manners. Its pages are a permanent and authentic source to see the social aspects of Germany during the last quarter of the 19th century onwards. </table>
brought to America at the age of six; and his training and all his interests were strongly American. At fourteen he was an illustrator on Leslie's Weekly, and was sent to twenty in England to illustrate the famous Sayers-Heenan prize-fight. He then went as recorder of Caribb's campaign and as special correspondent on the Civil War. The Civil War did not awaken his latent genius until 1864, when he published a cartoon of fierce irony against the political party which opposed Lincoln's re-election and advocated peace measures with the Southern Confederacy. He said, "and so we must be content to yield the germ of the American caricature; for all that had gone before was too crude in technique to pass muster even as good caricature."

The magnificent corruption of Tammany Hall under the leadership of the first municipal "bosses," gave Nast a subject worth attacking. Siegfried, earnest but light-hearted, armed with the mighty sword of the pen of ridicule, assailed the monster enconced in his treasure-cave, and after a long and exciting fight, carried it off triumphantly. He had a mere picture to carry his thrust; often his cartoon consisted of only a minor figure or two looking at a large placard on which a long and poignantly-worded attack was delivered in cold type. At other times the most ingenious pictorial slyness was displayed. Nast sounds almost the whole gamut of caricature, from downright ridicule to the most lofty denunciation. A very happy device was the representation of Tweed's face by a money-bag with only dollar marks. Another device used for the purpose was the "Godfather," a curiously faithful likeness of the "boodle" loving despot. When, finally, Tweed took to flight, to escape imprisonment, he was recognized and caught, it is said, entirely through the wide familiarity gone to his image in Nast's cartoons.

When he left Harper's Weekly, he was succeeded by W. A. Rogers, who composed many ingenious and telling cartoons. Of these perhaps the best-known is "Honest [Henderson]," caricature, prepared the way for the first purely comic weekly paper, Puck, founded by two Germans, and for long published in a German as well as an English edition—a journal which has cast its influence generally in the English, as the Denver Post has in the West. It is not that only the founders but the spirit of American caricature have been rather German than English, the American papers more closely resembling Fliegende Blätter, for example, than Punch. Indeed, the first writer of Puck was Joseph Kegler (1838-1904), long his chief caricaturist.

The Republican party soon found a champion in Judge, a weekly,-satirical paper which resembles Puck closely in its critically coloured pages for an men of a device, which less ingeniously exploited the execution of its block-and-white illustrations. These two papers have kept rather strictly to permanent staffs, and have furnished the opening for many popular draughtsmen, such as Bernard C. Criado (d. 1890), and Herford (8vo, London 1863), the Englishman, as Robert S. Loring, the American, as E. Zimmern, whose picture is extremely pleasing and broadly treated types often obscure the Falstaffian humour displayed in them; Grant Hamilton; Frederick Oppener, for many devoted to the suburban influence, and later lost his life in the sinking of the Titanic;牛肉; A. Smith; Frank A. Nankivell, whose pretty athletic girls are prone to anti-Britishizing; J. Mortimer Flagg; F. M. Howarth; Mrs Frances O'Neill Latham, whose portraits are singularly well modelled and alive; and Miss Baker Baker, a skilful draughtswoman of animals.

A stimulus to genuine art in caricature was given by the establishment (1883) of the weekly Life, edited by J. A. Mitchell, a clever draughtsman as well as an original writer. It is to this paper that American caricature owes the work of the most beautiful and versatile of the able American artist, Charles Dana Gibson, whose technique has developed through many interesting phases from exceeding delicacy to a sculpturesque boldness of line without losing its rich texture, and from the marvellously delicate to a manly simplicity. He is the greatest living American artist whose public for his almost idolatrous realizations of the beautiful American woman of various types, ages and environments. His work is, however, full of the most subtle character-observations, and his collection of brilliant and unique pictures, some of which have been selected for the Paris Exposition, is an important contribution to the art of caricature and to the aesthetic development of the art and spirit of caricature.

CARICATURE 335

Hyde, W. T. Smedley and A. B. Wenzel, each of them strongly individual in manner and often full of verve and truth. Life, and other comic papers, including for many years Truth, also brought forward caricaturists of distinct worth and a marked technical skill. Caricature was, later, introduced into American life, and the stylistic developments that have been noted in cartoons as well as allegorically; Oliver Herford has shown a fascination of elusiveness of analysis in his drawings as in his verse: T. S. Sullivan has made a quaintly intellectual application of the old-world devices in American life, and Cohl has developed the American individuality both in treatment and in humour; E. W. Kemble is notable among the expatriates of negro life; and H. B. Eddy, Augustus Dirck, Robert L. Wagner, A. Anderson, F. Sarka and J. S. Thomsen have all left a mark.

In distinction from the earlier period, the modern school of American caricature is strongly national, not only in subject, but in origin, training and in mental attitude, exception being made of a few notable figures, such as Mischel in the New York Ledger, and the somewhat Cokushekvanish technique. He came to America while young, and contributed a long series of what may be called shum-fantasies, with alike laughter with laughter, as well as extraordinary extravaganza in a most popular manner. It is always well to be very close to the affections of the large audience that welcomed them. American also by adoption is Henry Mayer, a German by birth, who has contributed to many of the chief comic papers of France, 8vo, London 1870; James T. E. Anderson, whose work has been very useful, and the American humour, and his field of publication has been chiefly the monthly magazine.

Entirely native in every way is the art of A. B. Frost (b. 1851), a prominent humorist who deals with the life of the common people. His caricature (he is also an illustrator of versatility and importance) is as convincing as it is humorous, and the type of sensational American imagination. Violent as the action of his figures frequently is, it is always convincing. Such triumphs as the tragedy of the kind-hearted man and the ungrateful bull-call; the spinner's cat that ate rat poison, and many others, force the most serious to laughter by their humorousness and the character of their action and expression. Frost is to American caricature what "Artco" Ward has been to American humour, and his field of publication has been chiefly the monthly magazine.

Scandinavia.—Caricature flourishes also in the Scandinavian countries, concordant, as the names are known beyond their borders. Professor A. H. Sevan of Denmark is an exception; his illustrations to C. Andersen (English edition, 1900) have carried his name wherever that author is appreciated, yet his reputation was made in the Danish Punch, which was founded after the year 1870 but has long ceased to exist. Alfred Schmidt and Axel Thies have contributed notable sketches to Puck and its successor Klockhaus, but in point of style they scarcely carry on the tradition of their predecessors, Arne Jürkisen. Among humorous artists of Norway, Th. Kettelsen perforce the best known. In Sweden, Bruno Liljefors, best known as a brilliant painter of bird life.

Daumier, John Leech, &c., indicated under those names.

CARIGARA, a town of the province of Leyte, island of Leyte, Philippine Islands, on Carigara Bay, 22 m. W. of Tacloban, the capital. Pop. (1905) 19,488, including that of Capocan (1,106), annexed to Carigara in the same year. Carigara is open to coast trade, exports large quantities of hemp, raises much rice, raises and manufactures cotton and abaca fabrics. It also has important fisheries.

CARIGNANO, a town of Piedmont, Italy, in the province of Turin, 11 m. S. by steam tramway from the town of Turin. Pop. (1901) town, 4072, commune, 7104. It has a handsome church (S. Giovanni Battista) erected in 1736-1766 by the architect Benedetto Aliferi di Sostegno (1700-1767), uncle of the poet Aliferi. S. Maria delle Grazie contains the tomb of Bianca Palaeologus, wife of Duke Charles I. of Savoy, at whose court Bayard was brought up. The town passed into the hands of the counts of Savoy in 1418.

Carigiano was erected by Charles Emmanuel I. of Savoy into a principality as an appanage for his third son, Thomas Francis (1596-1650), whose descendant, Charles Albert, prince of Carignano, became king of Sardinia on the extinction of the elder line of the house of Savoy with the death of Charles Felix in 1832. The house of Carignano developed two junior branches, those of Soissons and Villafranca. The first of these, which became extinct in 1734, was founded by Eugene Marie, second son of Thomas, by his wife Marie de Condé, countess of Soissons, who received his mother’s countship as his appanage. In 1662 the town of Yvois in the Ardennes was raised by Louis XIV. into a duchy in his favour, its name being changed at the same time to Carignan. The famous Prince Eugene was the second son of the first duke of Carignan. The branch of Villafranca started with Eugene Marie Louis (d. 1785), second son of Louis Victor of Carignano, whose grandson Eugene (1816-1888), afterwards an admiral in the Italian navy, was created prince of Savoy-Carignano, by King Charles Albert in 1834. He had contracted a morganatic marriage, and in 1888, on the occasion of his silver wedding, the title of countess of Villafranca was bestowed upon his wife, his eldest son, Filiberto, being at the same time created count of Villafranca, and his younger son, Vittorio, count of Soissons.

CARILLON, an arrangement for playing tunes upon a set of bells by a mechanical means. The word is said to be a Fr. form of Late Lat. or Ital. quadriglia, a simple dance measure on four notes or for four persons (Lat. quattuor); and is used sometimes for the tune played, sometimes (and more commonly in England) for the set of bells used in playing it. The earliest medieval attempts at bell music, as distinct from mere noise, seem to have consisted in striking a row of small bells by hand with a hammer, and illustrations in MSS. of the 12th and 13th centuries show this process on three, four or even eight bells. The introduction of mechanism in the form either of a barrel (see BELL-ORGAN) set with pegs or studs and revolving in connexion with the machinery of a clock, or of a keyboard struck by hand (CARILLON à clavier), made it possible largely to increase the number of bells and the range of harmonies. In Belgium, the home of the carillon the art of the carillonneur was at one time brought to great perfection and held in high esteem (see BELL); but even there it is gradually giving way to mechanism. In England manual skill has never been much employed, though keyboards on the continental model have been introduced, e.g. at the Manchester town hall, at Eaton Hall, and elsewhere; carillon music being mainly confined to hymn tunes at regular intervals (generally three hours), or chimes at the hours and intervening quarters. The "Cambridge" and "Westminster" chimes are very familiar; and more recently chimes have been composed by Sir John Steiner for Freshwater in the Isle of Wight ("Tennyson" Chimes), and by Sir Charles Stanford for "Bow Bells" in London.

CARINI, a town in the province of Palermo, Sicily, 13 m. by rail W.N.W. of Palermo. Pop. (1901) 13,931. On the coast are some ruins of the ancient Icara, the only Sician settlement (probably a fishing village) on the coast. It was stormed and taken by the Athenians in 415 B.C., and the inhabitants, among them the famous courteous Lais, sold as slaves. At La Grazi Christian catacombs have been found (Voc. degli Scavi, 1898, 362).

CARINTHIA (Ger. Kärnten), a duchy and crownland of Austria, bounded E. by Styria, N. by Styria and Salzburg, W. by Tirol, and S. by Italy, Görz and Gradisca and Carniola. It has an area of 480 sq. m. In the Carinthian Alps are divided by the Drave, which traverses it from west to east into two parts. To the north of the valley of the Drave the duchy is occupied by the Hohe Tauern and the primitive Alps of Carinthia and Styria, which belong to the central zone of the Eastern Alps. The Hohe Tauern contains the massifs of the Gross Glockner (12,455 ft.), the Hochnarr (10,670 ft.) and the Ankogel (11,006 ft.), and is traversed by the saddles of the Hochthor and the Malnitzer Tauern, which separates these groups from one another. To the east of the Hohe Tauern stretches the group of the primitive Alps of Carinthia and Styria, namely the Pfaeller Alps with the glacier-covered peak of the Hafner Eck (10,041 ft.); the Stang Alps with the highest peak the Eisenhüt (8807 ft.); and the Sausal Alps with the highest peak the Grosse Sausal (6823 ft.); and finally the Koralpen chain or the Stainer Alps (7023 ft.) separated from the preceding group by the Lavant valley. The country south of the Drave is occupied by several groups of the southern limestone zone, namely the Carnic Alps, the Julian Alps, the Karawanks and the Steiner Alps. The Carnic Alps are divided by the Gail valley into the South Carnic group and the northern Gailtal Alps. They are traversed by the Pontebba or Pontafel Pass, through which passes one of the principal Alpine roads from Italy to Austria. The road is covered by the fortress of Malborgh, where Captain Hensel with a handful of men met with a heroic death defending the place against an overwhelming French force in the campaign of 1809. A similar fate overtook, on the same day, the 18th of May 1809, Captain Hermann von Hermannsdorf and his small garrison, who were defending the Predil fort. This fort covers the road which traverses the Predil Pass in the Julian Alps and is the principal road leading from Carinthia to the Countland. Commemorative monuments have been erected in both places. The Gailtal Alps end with the Dobratsch or Villacher Alp (7007 ft.), situated to the south-west of Villach (q.v.), which is celebrated as one of the finest views in the whole eastern Alps. South of Hermagor, the principal peak of the Gail valley, is the chain of mountains which is famous as being the only place where the beautiful Wulfenia Carinthica is found. The highest peaks in the Karawanks are the Grosse Mittagskogel (7033 ft.), the Och Obrir (7023 ft.) and the Petzen (6934 ft.). The Ursula Berg (5565 ft.) ends the group of the Karawanks, which are continued by the Steiner Alps.

The principal river is the Drave, which flows from west to east through the length of the duchy, and receives in its course the waters of all the other streams, except the Fella, which reaches the Adriatic by its junction with the Tagliamento. Its principal tributaries are the Gail on the right, and the Möll, the Lieser, the Gurk with the Glen, and the Lavant on the left. Carinthia possesses a great number of Alpine lakes, which, unlike the other Alpine lakes, lie in the longitudinal valleys. The principal lakes are: the Millstatt-see (81 sq. m. in extent, 908 ft. deep, at an altitude of 1002 ft.), the Wörther-see (79 sq. m., in extent, 212 ft. deep, at an altitude of 1346 ft.), the Ossiach-see (102 sq. m.)
in extent, 150 ft. deep, at an altitude of 1590 ft.), and the elongated Weissen-see (43 m. long, 359 ft. deep, at an altitude of 389 ft.). The climate is severe in the north and north-west parts, while the south and south-east districts are mild, while the most favoured part is the Lavant valley. Of the total area only 13.71% is arable land, 10-50% is occupied by meadows and gardens, 5.18% by pastures, while 44.24% is covered by forests, almost exclusively pine-forests. Cattle-rearing is well developed, and the horses bred in Carinthia enjoy a good reputation. The mineral wealth of Carinthia is great, and consists in lead, iron, zinc and coal. Iron ore is extracted in the region of the Saulpe, and is worked in the foundries of St Leonhard, St Gertraud, Právati, Hirt, Treibach and Eberstein. About two-thirds of the total production of lead in Austria is extracted in Carinthia, the principal places being Bleiberg and Raibl. The metallurgical industries are well developed, and consist in the production of iron, steel, machinery, small-arms, lead articles, wire-cables and rails. The principal manufacturing places are Právati, Brücl, Klagenfurt, Lippitzbach, Wolfsberg, St Veit and Buchscheiden near Feldkirchen. The manufacture of small-arms is concentrated at Fertlach. Other trades are the manufacture of paper, leather, cement and the exploitation of forests.

The population of Carinthia in 1900 was 367,344, which corresponds to 97 inhabitants per sq. m. According to nationality, 71.54% were Germans, and 28.39% Slovenes, mostly settled in the districts adjoining the Slovene province of Carniola. Over 94% of the population were Roman Catholics. The local diet, of which the bishop of Gurk is a member ex officio, is composed of 37 members, and Carinthia sends 10 deputies to the Reichsrat at Vienna. For administrative purposes, the province is divided into seven districts, and an autonomous municipality, Klagenfurt (pop. 24,314), the capital. Other principal places are: Villach (9690), Wolfsberg (4852), St Veit (4667), an old town, the former capital of Carinthia up to 1518, Právati (4047), Travis (3649), a favourite summer-resort and tourist place, Bleiberg (3435), Völkermarkt (2606) and Spittal (2564).

Carinthia is so called from the Carni, a Celtic people, and in the time of Augustus it formed part of Noricum. After the fall of the Roman empire, it was the nucleus of the kingdom of Carentania, which was founded by Samo, a Frankish adventurer, but soon fell to pieces after his death. Under Charlemagne it constituted a margravate, which in 833 passed into the hands of Louis the German, whose grandson Arnulf was the first to be crowned the duke of Carinthia. The duchy was held by various families during the 11th, 12th and 13th centuries, and at length in 1335 was bestowed by Louis the Bavarian on the dukes of Austria. It was divided into Upper or Western Carinthia and Lower or Eastern; of these the former fell to France in 1809, but was reconquered in 1813. It was created a separate crown-land in 1849.

See Aelschier, Geschichte Kärntens (Klagenfurt, 1885).

CARINUS, MARCUS AURELIUS, Roman emperor, a.d. 283-284, was the elder son of the emperor Carus, on whose accession he was appointed governor of the western portion of the empire. He fought with success against the German tribes, but soon left the defence of the Upper Rhine to his legates and returned to Rome, where he abandoned himself to all kinds of debauchery and excess. He also celebrated the ludi Romani on a scale of unexampled magnificence. After the death of Carus, the army in the East demanded to be led back to Europe, and Numerianus, the younger son of Carus, was forced to comply. CARISSIMI—

CARISSIMI, GIACOMO (c. 1604–1674), one of the most celebrated masters of the Italian, or, more accurately, the Roman school of music, was born about 1604 in Marino (near Rome). Of his life almost nothing is known. At the age of twenty he became chapel-master at Assisi, and in 1628 he obtained the same position at the church of St Apollinaris belonging to the Collegium Germanicum in Rome, which he held till his death on the 12th of January 1674, at Rome. He seems never to have left Italy. The two great achievements generally ascribed to him are the further development of the recitative, lately introduced by Monteverde, and of infinite importance in the history of dramatic music; and the invention of the chamber-cantata, by which Carissimi superseded the madrigals formerly in use. His position in the history of church music and vocal chamber music is somewhat similar to that of Cavalli in the history of opera. It is impossible to say who was really the inventor of the chamber-cantata; but Carissimi and Luigi Rossi were the composers who first made this form the vehicle for the most intellectual style of chamber-music, a function which it continued to perform until the death of Alessandro Scarlattti, Astorga and Marcello. Of his oratorios Jephtah has been published by Novello & Co., and is well known; this is followed and imitated by an operatic form of oratorio unaccompanied by dramatic action, which has maintained its hold to the present day. He also may claim the merit of having given greater variety and interest to the instrumental accompaniments of vocal compositions.

Dr Burney and Sir John Hawkins published specimens of his compositions in their works on the history of music; and Dr Aldrich collected an almost complete set of his compositions, at present in the library of Christ Church, Oxford. The British Museum also possesses numerous valuable works by this great Italian master. Most of his oratorios are in the Bibliothèque Nationale at Paris.

CARLETON, WILLIAM (1794–1869), Irish novelist, was born at Frilisik, Clougher, Co. Tyrone, on the 4th of March 1794. His father was a tenant farmer, who supported a family of fourteen children on as many acres, and young Carleton passed his early life among scenes precisely similar to those he afterwards delineated with so much power and truthfulness. His father was remarkable for his extraordinary memory, and had a thorough acquaintance with Irish folklore; the mother was noted thorough the district for the sweetness of her voice. The beautiful character of Honor, the miser's wife, in Fardorougha, is said to have been drawn from her.

The education received by Carleton was of a very humble description. As his father removed from one small farm to another, he attended at various places the hedge-schools, which used to be a notable feature of Irish life. The admirable little picture of one of these schools is given in the sketch called "The Hedge School" included in Traits and Stories of Irish Peasantry. Most of his learning was gained from a curate named Keenan, who taught a classical school at Donagh (Co. Monaghan), which Carleton attended from 1814 to 1816. Before this Carleton had resolved to prosecute his education as a poor scholar at Munster, with a view to entering the church; but in obedience to a warning dream, the story of which is told in the Poor Scholar, he returned home, where he received the unabated veneration of the neighbouring peasantry for his supposed wonderful learning. An amusing account of this phase of his existence is given in the little sketch, "Denis O'Shaughnessy." About the age of nineteen he undertook one of the religious pilgrimages then common in Ireland. His experiences as a pilgrim, narrated in "The Lough Derg Pilgrim," made him resign for ever the thought of entering the church, and he eventually became a Protestant. His vacillating ideas as to a mode of life were determined in a definite direction by the reading of Gil Bias. He resolved to cast himself boldly upon the world, and try what fortune had in store for him. He went to Killanny, Co. Louth, and for six months acted as tutor in the family of a farmer named Piers Murphy, and after some other experiments he set out for Dublin, and arrived in the metropolis with 2s. 9d. in his pocket. He first sought occupation as a bird-stuffer, but a proposal to use potatoes and meal as stuffing failed to recommend him. He then determined to become a soldier, but the colonel of the regiment in which he desired to enlist persuaded him—Carleton had applied in Latin—to give up the idea. He obtained some teaching and a clerkship in a Sunday School office, began to contribute to the journals, and his paper "The Pilgrimage to Lough Derg," which was published in the Christian Examiner, excited great attention. In 1830 appeared the first series of Traits and Stories of the Irish Peasantry (2 vols.), which at once placed the author in the first rank of Irish novelists. A second series (3 vols.), containing, among other stories, "Tubber Derg, or the Red Well," appeared in 1833, and Tales of Ireland in 1834. From that time till within a few years of his death Carleton's literary activity was incessant. "Fardorougha the Miser, or the Convicts of Lissanoma" appeared in 1837–1838 in the Dublin University Magazine. Among his other famous novels are: Valentine McClutchy, The Irish Agent, or Chronicles of the Castle Cumber Property (3 vols., 1843); The Black Prophet, a Tale of the Famine, in the Dublin University Magazine (1846), printed separately in the next year; The Emigrants of Abadarra (1847); Willy Reilly and his dear Colleen Bawn (in The Independent, London, 1850); and The Tilke Proctor (1849), the last of which brings his own countrymen. Some of his later stories, The Squanders of Castle Squander (1852) for instance, are defaced by the mass of political matter with which they are overloaded. In spite of his very considerable literary production Carleton remained poor, but his necessities were relieved in 1848 by a pension of £200 a year granted by Lord John Russell in response to a memorial on Carleton's behalf signed by numbers of distinguished persons in Ireland. He died at Sandford, Co. Dublin, on the 30th of January 1869.

Carleton's best work is contained in the Traits and Stories of the Irish Peasantry. He wrote from intimate acquaintance with the scenes he described; and he drew with a sure hand a series of pictures of peasant life, unsurpassed for their appreciation of the passionate tenderness of Irish home life, of the buoyant humour and the domestic virtues which would, under better circumstances, bring prosperity and happiness. He alienated the sympathies of many Irishmen, however, by his unsparing criticism and occasional exaggeration of the darker side of Irish life. He would not be blamed for his having given his contemporaries a picture of his own habits and manners, their feelings, their prejudices, their superstitions and their crimes.” (Preface to Tales of Ireland.)

During the last months of his life Carleton began an autobiography which he brought down to the beginning of his literary career. This forms the first part of The Life of William Carleton... (2 vols., 1869), by D. J. O'Donoghue, which contains full information about his life, and a list of his scattered writings. A selection from his stories (1889), in the "Camelot Series," has an introduction by Mr W. B. Yeats. He must not be confused with Will Carleton (b. 1845), the American author of Farm Ballads (1873).

CARLETON PLACE, a town and port of entry of Lanark county, Ontario, Canada, 28 m. S.W. of Ottawa, on the Mississippi river, and at the junction of the main line and Brockville branch of the Canadian Pacific railway. It has abundant water-power privileges, and extensive railway-repair shops and woolen mills. Pop. (1901) 4059.

CARLILE, RICHARD (1790–1843), English freethinker, was born on the 8th of December 1790, at Ashburnon, Devonshire, the son of a shoemaker. Educated in the village school, he was apprenticed to a tinman aged fifteen, but he frequently rebelled. Having finished his apprenticeship, he obtained occupation in London as a journeyman tinman. Influenced by reading Paine's Rights of Man, he became an uncompromising radical, and in 1817 started pushing the sale of the Black Dwarf, a new weekly paper, edited by Jonathan Wooler, all over London, and in his zeal to secure the dissemination of its doctrines frequently walked 30 m. a day. In the same year he also printed and sold 25,000 copies of Southey's Wat Tyler, reprinted the suppressed Parodies of Hone, and wrote himself, in imitation of them, the Political Litanie. This work cost him eighteen weeks imprisonment. In 1818 he published Paine's works, for which
and for other publications of a like character he was fined £3,500, and sentenced to three years' imprisonment in Dorchester gaol. Here he published the first twelve volumes of his periodical the Republican. The publication was continued by his wife, who was accordingly sentenced to two years' imprisonment in 1821. A public subscription, headed by the duke of Wellington, was now raised to prosecute Carli's assistants. At the same time Carlile's furniture and stock-in-trade in London were seized, three years were added to his imprisonment in lieu of payment of his fine, his sister was fined £500 and imprisoned for a year for publishing an address by him, and nine of his shopmen received terms of imprisonment varying from six months to three years. In 1825 the government decided to discontinue the prosecutions. After his release in that year Carlile edited the Gorgon, a weekly paper, and conducted free discussions in the London Rotunda. For refusing to give sureties for good behaviour after a prosecution arising out of a refusal to pay church rates, he was again imprisoned for three years, and similar resistance cost him ten weeks' more imprisonment in 1834-1835. He died on the 10th of February 1843, after having spent in all nine years and four months in prison.

CARLINGFORD, CHICHESTER SAMUEL FORTESCUE, Baron (1823-1868), British statesman, son of Chichester Fortescue (d. 1826), M.P. for Louth in the Irish parliament, was born in January 1823. He came of an old family settled in Ireland since the days of Sir Faithful Fortescue (1581-1666), whose uncle, Lord Chichester, was lord deputy. The history of the family was written by his elder brother Thomas (1815-1887), who in 1832 was created Baron Clerkmont. The future Lord Carlingford, then Mr Chichester Fortescue, went to Christ Church, Oxford, where he took his first classes (1842) and won the chancellor's English essay (1846); and in 1847 he was elected to parliament for Louth as a Liberal. He became a junior lord of the treasury in 1854, and subsequently held minor offices in the Liberal administration till in 1865 he was made chief secretary for Ireland under Lord Russell, a post which he again occupied under Gladstone in 1868-1870; he then became president of the Board of Trade (1871-1874), and later lord privy seal (1881-1883) and president of the council (1883-1885). He was raised to the peerage in 1874. He parted from Gladstone on the question of Irish Home Rule, but in earlier years he was his active supporter on Irish questions. His influence in society was due largely to his wife, Frances (1821-1870), previously the wife of the 7th Earl Waldegrave, whom he married in 1853. In 1887 his brother, Lord Clerkmont, died, and Carlingford inherited his peerage; but on his own death without issue on the 30th of January 1888 both titles became extinct.

CARLINGFORD, a small market town and port of Co. Louth, Ireland, in the northern parliamentary division. Pop. (1901) 606. It is beautifully situated on the western shore of Carlingford Lough, at the foot of Carlingford Mountain (1935 ft.), facing the fine heights of the Mourne Mountains across the lough in Co. Down. It has a station on the railway connecting Greenore and Newry, owned by the London & North-Western railway of England. It was formerly a place of great importance, as attested by numerous remains. King John's Castle (1210) commands the lough from an isolated rock. There are other remains of the castellated houses erected during the Elizabethan and previous wars. A Dominican monastery was founded in 1308, and combines ecclesiastical and military remains. The town received several charters between the reigns of Edward II. and James II., was represented in the Irish parliament until the Union, and possessed a mint from 1497. The lough is a typical rock-basin hollowed out by glacial action, about 4 fathoms deep at its entrance, but increasing to four times that depth within. The oyster beds were very extensive.

CARLI-RUBBI, GIOVANNI RINALDO, Count of (1729-1795), Italian economist and antiquarian, was born at Capo d'Istria, in 1729. At the age of twenty-four he was appointed by the senate of Venice to the newly established professorship of astronomy and navigation in the university of Padua, and entrusted with the superintendence of the Venetian marine. After filling these offices for seven years with great credit, he resigned them, in order to devote himself to the study of antiquities and political economy. His principal economic works are his Delle monete, e della istituzione delle secole d'Italia; his Risanamento sopra i bilanci economici delle nazioni (1759), in which he maintained that what is termed the balance of trade between two nations is no criterion of the prosperity of either, since both may be gainers by their reciprocal transactions; and his Sul libero commercio dei grani (1771), in which he argues that free trade in grain is not always advisable. Count Carlì's merits were appreciated by Leopold of Tuscany, afterwards emperor, who in 1765 placed him at the head of the council of public economy and of the board of public instruction. In 1769 he became privy councillor, in 1771 president of the new council of finances. He died at Milan in February 1795. During his leisure he completed and published his Antichità Italiche, in which the literature and arts of his country are ably discussed. Besides the above, he published many political, antiquarian, economic and other subjects, including L'Uomo libero, in connexion with the constitution of Rousseau's Contrat Social; an attack upon the abbé Tarrattoti's assertion of the existence of magicians; Observazioni sulla musica antica e moderna; and several poems.

CARLISLE, EARLS OF. This English title has been held by two families, being created for James Hay in 1623, and being extinct in that line on the death of his son in 1660, and then being given in 1661 to Charles Howard, and descending to the present day in the Howard family.

JAMES HAY, 1st earl of Carlisle (d. 1630), was the son of Sir James Hay of Kingskirk (a member of a younger branch of the Errol family), and of Margaret Murray, cousin of George Hay, afterwards 1st earl of Kinnoull. He was knighted and taken into favour by James VI. of Scotland, brought into England and there treated as a 'prime favourite' and made a gentleman of the bedchamber. In 1604 he was sent on a mission to France and pleaded for the Huguenots, which annoyed Henry IV. and caused a substantial reduction of the present made to the English envoy. On the 21st of June 1606 he was created by patent a baron for life, with precedence next to the barons, but without a place or voice in parliament, no doubt to render his advancement less unpalatable to the English lords. The king bestowed on him numerous grants, paid his debts, and secured for him a rich bride in the person of Honora, only daughter and heir of Edward, Lord Denny, afterwards earl of Norwic. In 1610 he was made a knight of the Bath, and in 1613 master of the wardrobe, while in 1615 he was created Lord Hay of Sawley, and took his seat in the House of Lords. He was sent to France next year to negotiate the marriage of Princess Christina with Prince Charles, and on his return, being now a widower, married in 1617 Lady Lucy Percy (1599-1660), daughter of the 9th earl of Northumberland, and was made privy councillor. In 1618 he resigned the mastership of the wardrobe for a large sum in compensation. He was created Viscount Doncaster, and in February 1620 was despatched on a mission to Germany, where he identified himself with the cause of the elector palatine and urged James to make war in his support. In 1621 and 1622 he was sent to France to obtain peace for the Huguenots from Louis XIII., in which he was unsuccessful, and in September 1622 was created earl of Carlisle. Next year he went to Paris on the occasion of Prince Charles's journey to Madrid, and again in 1624 to join Henry Rich, afterwards Lord Holland, in negotiating the prince's marriage with Henrietta Maria, when he advised James without success to resist Richelieu's demands on the subject of religious toleration. On the 2nd of July 1627 Lord Carlisle obtained from the king a grant of all the Caribbean islands, including Barbados, this being a confirmation of a former concession given by James I. He was also a patentee and councillor of the plantation of New England, and showed great zeal and interest in the colonies. He became gentleman of the bedchamber to King Charles L after his accession. In 1628, after the failure of the expedition to Rhé, he was sent to make a diversion against Richelieu in Lorraine and Piedmont; he counselled peace with Spain and the
vigorou prosecution of the war with France, but on his return home found his advice neglected. He took no further part in public life, and died in March 1636. Carlisle was a man of good sense and of accommodating temper, with some diplomatic ability. His extravagance and lavish expenditure, his "double suppers" and costly entertainments, were the theme of satirists and wonder of society, and his debts were said at his death to amount to more than £80,000. "He left behind him," says Clarendon, "a reputation of a very fine gentleman and a most accomplished courtier, and after having spent, in a very jovial life, above £100,000, which under a strict computation he received from the crown, he left not a house or acre of land to be remembered by."

The charms and wit of his second wife, Lucy, countess of Carlisle, which were celebrated in verse by all the poets of the day, including Carew, Cartwright, Herrick and Suckling, and by Sir Toby Matthew in prose, made her a conspicuous figure at the court of Charles I. There appears no foundation for the scandal which made her the mistress successively of Strafford and of Pym. Strafford valued highly her sincerity and services, but after his death, possibly in consequence of a revulsion of feeling at his abandonment by the court, she devoted herself to Pym and to the interests of the parliamentary leaders, to whom she communicated the king's most secret plans and counsels. Her greatest achievement was the timely disclosure to Lord Essex of the king's intended arrest of the five members, which enabled them to escape. But she appears to have served both parties simultaneously, betraying communications on both sides, and doing considerable mischief in inflaming political animosities. In 1645 she attached herself to the interests of the moderate Presbyterian party, which assembled at her house, and in the second Civil War showed great zeal and activity in the royal cause, pawned her pearl necklace for £1,500 to raise money for Lord Holland's troops, established communications with a Prince Charles, and during her blockade of the Thames, made herself the intermediary between the scattered bands of royalists and the queen. In consequence her arrest was ordered on the 21st of March 1649, and she was imprisoned in the Tower, whence she maintained a correspondence in cipher with the king through her brother, Lord Percy, till Charles went to Scotland. Accused as a royalist, while in the Tower she was threatened with the rack to extort information. She was released on bail on the 25th of September 1650, but appears never to have regained her former influence in the royalist counsels, and died soon after the Restoration, on the 5th of November 1660.

The first earl was succeeded by James, his only surviving son by his first wife, at whose death in 1666 without issue, the peerage became extinct in the Hay family.

Charles Howard, 1st earl of Carlisle in the Howard line (1630-1685), was the son and heir of Sir William Howard, of Naworth in Cumberland, by Mary, daughter of William, Lord Eure, and great-grandson of Lord William Howard, "Belted Will" (1563-1640), and was born in 1629. In 1645 he became a Protestant and supported the government of the commonwealth, being appointed high sheriff of Cumberland in 1650. He bought Carlisle Castle and became governor of the town. He distinguished himself at the battle of Worcester on Cromwell's side, was made a member of the council of state in 1653, chosen captain of the protector's body-guard and selected to carry out various public duties. In 1655 he was given a regiment, was appointed a commissioner to try the northern rebels, and a deputy major-general of Cumberland, Westmorland and Northumberland. In the parliament of 1653 he sat for Westmorland, in those of 1654 and 1656 for Cumberland. In 1657 he was included in Cromwell's House of Lords and voted for the protector's assumption of the royal title the same year. In 1659 he urged Richard Cromwell to defend his government by force against the army leaders, but his advice being refused he used his influence in favour of a restoration of the monarchy, and after Richard's fall he was imprisoned. In April 1660 he sat again in parliament for Cumberland, and at the Restoration was made custos rotulorum of Essex and lord-lieutenant of Cumberland and Westmorland. On the 20th of April 1661 he was created Baron Dacre of Gilleland, Viscount Howard of Morpeth, and earl of Carlisle; the same year he was made vice-admiral of Northumberland, Cumberland and Durham, and in 1662 joint commissioner for the office of earl marshal. In 1663 he was appointed ambassador to Russia, Sweden and Denmark, and in 1668 he carried the Garter to Charles XI. of Sweden. In 1667 he was made lieutenant-general of the forces and joint commander-in-chief of the four northernmost counties. In 1672 he became lord-lieutenant of Durham, and in 1673 deputy earl marshal. In 1678 he was appointed governor of Jamaica, and reappointed governor of Carlisle. He died on the 24th of February 1685, and was buried in York Minster. He married Anne (d. 1666), daughter of Edward, 1st Lord Howard of Escrick; his eldest son Edward (c. 1646-1692) succeeded him as 2nd earl of Carlisle, the title descending to his son Charles (1674-1738) and grandson Henry (1694-1738).

Frederick Howard, 5th earl (1748-1823), son of the 4th earl, was born in 1748. During his youth he was chiefly known as a man of pleasure and fashion; and after he had reached thirty years of age, his appointment on a commission sent out by Lord North to attempt a reconciliation with the American colonies was received with sneers by the opposition. The failure of the embassy was not due to any incapacity on the part of the earl, but to the unpopularity of the government from which it received its authority. He was, indeed, considered to have displayed so much ability that he was entrusted with the vice-royalty of Ireland in 1786. The time was one of the greatest difficulty; for while the calm of the country was disturbed by the American rebellion, it was drained of regular troops, and large bands of volunteers not under the control of the government had been formed. Nevertheless, the two years of Carlisle's rule passed in quietness and prosperity, and the institution of a national bank and other measures which he effected left permanently beneficial results upon the commerce of the island. In 1786, in the discussions as to the regency, Carlisle took a prominent part on the side of the prince of Wales. In 1791 he opposed Pitt's policy of resistance to the dismemberment of Turkey by Russia; but on the outbreak of the French Revolution he left the opposition and vigorously maintained the cause of war. In 1815 he opposed the enactment of the Corn Laws; but from this time till his death, in 1825, he took no important part in public life. Carlisle was the author of some political tracts, a number of poems, and two tragedies, The Father's Revenge and The Stepmother, which received high praise from his contemporaries. His mother was a daughter of the 4th Lord Byron, and in 1798 he was appointed guardian to Lord Byron, the poet, who lampooned him in English Bards and Scotch Reviewers.

George Howard, 6th earl (1773-1848), eldest son of the 5th earl, entered parliament as Lord Morpeth in 1795 as a Whig. He was appointed to the Indian board in 1806, when the "Ministry of all the Talents" took office, but resigned in 1807, though he remained prominent in the House of Commons. After his elevation to the House of Lords (1825), he held various cabinet offices under Canning and Grey. He made some minor contributions to literature and left the reputation of an amiable scholar.

George William Frederick Howard, 7th earl (1802-1864), was born in London on the 18th of April 1802. He was the eldest son of the 6th earl by his wife Lady Georgiana Cavendish, eldest daughter of the duke of Devonshire. He was educated at Eton and Christ Church, Oxford, where (as Lord Morpeth) he earned a reputation as a scholar and writer of graceful verse, obtained in 1821 both the chancellor's and the Newdigate prizes for a Latin and an English poem. In 1826 he accompanied his uncle, the duke of Devonshire, to Russia, to attend the coronation of the tsar Nicholas, and became a great favourite in society at St Petersburg. At the general election of the same year he was returned to parliament as member for the family borough of Morpeth. In one of his earliest speeches he undertook,
at the risk of forfeiting the good opinion of the Liberal party, the defence of the Russian emperor against severe attacks made on him in reference to the suppression of the Polish insurrection of 1830. In the agitation for parliamentary reform he took the side of Earl Grey; and after the dissolution of parliament, which took place about that time, he was elected member for Yorkshire. This seat he held till after the passing of the Reform Bill in 1832. He was then returned for the West Riding; and in 1835 he was appointed by Lord Melbourne chief secretary for Ireland, a position at that time of great difficulty, O'Connell being then at the height of his reputation. This post he held for about six years (being included in the cabinet in 1839), winning great popularity by his amiable manners and kindly disposition. Losing his seat at the election of 1841, he visited the United States, but in 1846 he was again returned for the West Riding, and was made chief commissioner of woods and forests in Lord John Russell's cabinet. Succeeding to the peerage in 1848, he became chancellor of the duchy of Lancaster in 1850. The great event of his life, however, was his appointment by Lord Palmerston to the lord-lieutenancy of Ireland in 1855. This office he continued to hold till February 1858, and again from June 1858 till within a few months of his death. His literary tastes and a culture were displayed in various popular lectures and by several published works. The last work he mentioned a lecture on *The Life and Writings of Pope* (1851); *The Last of the Greeks*, a tragedy (1858); a *Diary in Turkish and Greek Waters* (1854), the fruit of travels in the East in 1853 and 1854; and a volume of *Poems*, published after his death. In 1866 appeared his *Viceregal Speeches*, collected and edited by J. Gaskin. He took warm interest in the reformation of juvenile criminals, and established on his own estate one of the best conducted reformatory institutions in the country. Lord Carlisle died at Castle Howard on the 5th of December 1864. He was never married, and was succeeded in the peerage by his brother, the REV. WILLIAM GEORGE HOWARD (d. 1889), as 8th earl.

GEORGE JAMES HOWARD, 9th earl, born in 1843, was the son of Charles, fourth son of the 6th earl. He was educated at Eton and Trinity, Cambridge, and, then being only Mr Howard, married in 1864 Rosalind, daughter of the 2nd Lord Stanley of Alderley. He sat in parliament as a Liberal in 1879-1886, and again from 1881 to 1885; and succeeded his uncle in the peerage in 1889. His wife, a more active Liberal politician than himself, took a prominent part in the temperance movement and other advanced causes; and Lord Carlisle became best known as an active politician and an artist of considerable ability, whose landscape painting had considerable affinity to the work of Giovanni Costa. His position as a connoisseur was recognized by his being made one of the trustees of the National Gallery. His son, Viscount Morpeth (b. 1867), had a distinguished career at Oxford, and after various defeats in other constituencies was returned to parliament for South Birmingham as a Unionist supporter of Mr Chamberlain in 1904.

CARLISLE, a city, municipal and parliamentary borough, and the county town of Cumberland, England, 290 m. N.N.W. of London, and 8 m. S. of the Scottish border. Pop. (1901) 45,480. It lies on the south bank of the river Eden, a little below the point where it debouches upon the Solway Plain, 8 m. above its mouth in the Solway Firth, at the junction of two tributaries from the south, the Caldew and the Petteril. The city grew up originally on and about the two slight eminences of the peninsula enclosed between these three streams. To the north of the Eden lies the suburb of Stanwix, connected with the city by a handsome bridge (1813). This river is navigable, and an ancient canal opened in 1223, connecting the city with Port Carlisle on the Solway Firth, was unsuccessful, and was converted into a railway. Silloth, on the Irish Sea, is the nearest port of importance (21 m.). Carlisle, however, is one of the principal railway centres in Great Britain. The London & North-Western and the Midland railways of England, and the Caledonian, North British and Glasgow & South-Western of Scotland, here make a junction for through traffic between England and Scotland; and the city is further served by the North Eastern (from Newcastle) and the Maryport & Carlisle railways.

Carlisle is the seat of a bishop. Bede, in his life of St Cuthbert, alludes to a monastery here, and the saint was also believed to have founded a convent and school. But all was swept away by the Northmen, and though William Rufus, who rehabilitated the town, doubtless made provision for an ecclesiastical foundation, it was left for Henry I., in 1153, to create a bishopric out of the house of Augustinian canons, founded in 1102. This was the sole episcopal chapter of regular canons of St Augustine in England. It was dissolved in 1540. Between 1156 and 1204 the bishop's throne was unoccupied, but thereafter there was a continuous succession. The diocese covers the whole of Westmorland, and practically of Cumberland, with Furness and the adjacent district in the north of Lancashire. The cathedral as it stands is a fine cruciform building with a central tower, but it is incomplete. Of the Norman nave, built by Ethelwold, the first prior and bishop, only two bays are standing, the remainder having been destroyed by the Parliamentarians in 1646. The south transept, and the lower part of the tower piers, are also of this period. Remarkable distortion is seen in some portions of the great nave. The thickness of the aisle walls, and the rude masonry of the foundations of the original apse which have been discovered, point to native, not Norman, workmanship. The choir is ornate and beautiful, and the huge Decorated east window, with its wonderful elaborate tracery, is perhaps the finest of its kind extant. The reconstruction of the Norman choir was begun in the middle of the 13th century, but the work was almost wholly destroyed by fire in 1292. The north transept and the tower also suffered. Building began again c. 1352, and the present tower, erected with some difficulty on the weak foundations of the Norman period, dates from 1400-1410. The conventual buildings are scanty, including little more than a Perpendicular gateway and refectory. A stone inscribed with runes, and a well, are among the objects of interest within the cathedral. Among the numerous memorials is one to Archbishop Paley; and a stained-glass window commemorates the five children of Archbishop Campbell Tait, dean of the cathedral, and afterwards archbishop of Canterbury. Of the two eminences within the three rivers, the cathedral occupies one, the castle the other. It was mote, and very strong; but the latter appears to have been abandoned as a fortification. A tower in which Mary, queen of Scots, was imprisoned was taken down in 1835. The castle serves as barracks. Fragments of the old city walls are seen on the western side over against the river Caldew. At Carlisle are the county gaol and the Cumberland infirmary, in connexion with which there is a seaside convalescent institution at Silloth. Other notable public buildings are the city hall, the court-houses, museum and art gallery. The grammar school, of very early foundation, received endowment from Henry VIII. Industries include the manufacture of cotton and woollen goods, and there are iron foundries, breweries, tanneries and large railway works. There is also a considerable agricultural trade. The parliamentary borough returns one member. The municipal borough is under a mayor, 10 aldermen and 30 councillors. Area, 2,023 acres.

This was the Romano-British *Luguvallium*, probably rather a town than a fort, being one of the few towns as distinct from forts in the north of Britain. It lay a mile south of Hadrian's Wall. There are no traces above ground in situ; but many inscriptions, potsherds, coin and other such relics have been discovered.

Carlisle (Caer Luel, Caridol) is first mentioned in 685, when under the name of Luel it was besetted by Egfrith on St Cuthbert to form part of his see of Lindisfarne. It was then a thriving and populous city, and when St Cuthbert visited it in 686 he was shown with pride the ancient walls and a Roman fountain of marvellous construction. Nennius, writing in the 9th century, mentions it in a list of British cities under the name of Caer Luadil, Caer Liguaid or Caer Luaid, but about this time it was either wholly or in part destroyed by the Danes, and vanishes completely from history until 1092 it was re-established as the political centre of the district by William Rufus,
CARLISLE—CARLOMAN

who built the castle and sent husbandmen to dwell there and till the land. During the centuries of border-strife which followed, the history of Carlisle centres round that of the castles which formed the chief bulwark against the Scots on the western border, and played an important part in the history of the country down to the rebellion of the young Pretender in 1745. In 1292 a great fire destroyed nearly all the buildings and muniments of the city, so that no original charter is extant before that date. A charter from Edward I., dated 1293, however, exemplifies two earlier grants. The first, from Henry II., confirmed the liberties and customs which the city had thertofoore enjoyed, granting in addition a free gild merchant, with other privileges. This grant is exemplified in the second charter, from Henry III., dated 1251. By a writ dated 5 Henry III. the citizens were allowed to hold the city direct from the king, paying a fee-farm rent of £60, instead of the former rent of £50, paid by the medium of the sheriff. A charter from Edward II., dated 1316, grants the citizens the city, the king's mills in the city, and the fishery in the Eden, at a fee-farm rent of £80 a year. A charter from Edward III. in 1352 enumerates the privileges and liberties hitherto enjoyed by the citizens, including a market twice a week, on Wednesday and Saturday; a fair for sixteen days at the feast of the Assumption; a fair for three days at the town meetings; a fair for two days in the market, mayor, bailiffs and two coroners; and the right to hold their markets in the place called "Battalholm." It also mentions that the city was greatly impoverished by reason of the devastations of the Scots and by pestilence. Confirmations of former privileges were issued by Richard II., Henry IV. and Henry VI. A charter from Edward IV. in 1461, after reciting the damage sustained by the city through fire, reduced the fee-farm rent from £80 to £40, and granted to the citizens the fishery called the sheriff's net, free of rent. Further confirmations were granted by later sovereigns. Although the city had been under the jurisdiction of a mayor and bailiffs at least as early as 1290, the first charter of incorporation was granted by Elizabeth in 1566; it established a corporation under the style of "a mayor, eleven worshipful persons, and twenty-four able persons." A charter of James I. confirmed former liberties, and in 1638 Charles I. granted a charter under which the town continued to be governed until 1833. It declared Carlisle a city by itself, and established a corporation consisting of a mayor, 11 aldermen, 24 capital citizens, 2 bailiffs, 2 coroners and a recorder; the mayor, the aldermen and the bailiffs to be chosen by the commonalty; and the mayor to be clerk of the market; other officers were a common clerk, a sword-bearer and three sergeants-at-arm. Two charters from Charles II. in 1664 and 1684 were never accepted. The latter granted a three days' fair or market on the first Wednesday in June. Much valuable information relating to the early history and customs of Carlisle is furnished both by the Dormont Book, which contains an elaborate set of bye-laws dated 1561, and by the records of the eight craft gilds—weavers, smiths, tailors, tanners, shoemakers, skinners, butchers and merchants. The defensive and offensive warfare in which the citizens were constantly engaged until the union of the crowns of England and Scotland left little time for the development of commercial pursuits, and Fuller, writing in the 17th century, says that the sole manufacture, that of fustian, though established shortly after the Restoration, had met with scant encouragement. In 1750 the manufacture of coarse linen cloth was established, and was followed in a few years by the introduction of calico stamping. The commercial prosperity of Carlisle, however, began with the completion of the canal. In 1783 the citizens of Carlisle were summoned to send two representatives to parliament, but no return is recorded. From 1293 Carlisle continued to return two members until the Redistribution Act of 1885. At the time of the Scottish wars Edward I. held two parliaments at Carlisle—in 1300 and in 1307.

See Victoria County History, Cumberland; R. S. Ferguson, Some Municipal Records of the City of Carlisle (Cumberl. and Westm. Antiq. and Archaeol. Soc., Carlisle and London, 1887); and Royal Charters of Carlisle (ditto, Carlisle, &c., 1894); Mandell Creighton, Carlisle in "Historic Towns" series (London, 1889).

CARLISLE, a borough and the county-seat of Cumberland county, Pennsylvania, U.S.A., 18 m. W. by S. of Harrisburg and 119 m. W. by N. of Philadelphia. Pop. (1900) 7620; (1910) 10,930. It is served by the Cumberland Valley (controlled by the Pennsylvania railway) and the Gettysburg & Harrisburg railways. The borough is pleasantly situated in the central part of the fertile Cumberland Valley, which is here 12 m. wide. Mount Holly Springs and Bolling Springs are near, and are important summer attractions.

In Carlisle is Dickinson College, founded in 1783 by Presbyterians, and named in honour of John Dickinson (q.v.), a benefactor of the college; it was reorganized in 1833 as a Methodist Episcopal College, and is now divided into the college, the school of law (founded in 1834) and Conway Hall, the preparatory department. President James Buchanan and Chief Justice R. B. Taney were graduates. Here are also Metzger College for young ladies, and a well-known United States Indian industrial school, established in 1879 through the efforts of Lieutenant (later Brigadier-General) Richard Henry Pratt (b. 1840), its superintendent until 1904; the school pays special attention to industrial and agricultural training, and its athletic organizations are famous. A great effort is made to preserve and develop Indian arts and crafts; the instruction given by Indians, the Burlington Indian Manufacturing Company, and the Indian Fair, with its famous Indian tent which exhibits the products of the arts and manufactures of the red men, furnish a remarkable example of the efforts made to preserve the Indian industries.

At the time of the Delawares' early visit, it was the site of a small settlement of about 50 families. In 1750 the city was destroyed by the Delaware Indians, and for a short time was abandoned. It was again occupied in 1755 by Sir William Johnson, and in 1758 by George Washington during the Whisky Rebellion. The town was laid out as a town in 1751, and in 1753 Benjamin Franklin, with two other commissioners, negotiated a treaty with the Ohio Indians here. During the War of Independence the Americans kept here for secure confinement a number of British prisoners, among them Major John André, and in 1784 Carlisle was the headquarters of General Washington during the Whisky Rebellion. On the night of the 3rd of July 1863 Carlisle was bombarded by Confederate troops.

CARLOForte, a town of Sardinia, in the province of Cagliari, the capital of the small island (6 by 3 m.) of San Pietro (anc. Acestium or Τεταρακονταχώρος) off the west coast of Sardinia. Pop. (1901) 763. It lies on the east coast of the island, 6 m. west by sea from Porto Cervo, which is 47 m. west by rail from Cagliari. It was founded in 1737 by Charles Emmanuel III. of Savoy, who planted a colony of Genoese, whose dialect and costume still prevail. In 1708 it was attacked by the Tunisians and 933 inhabitants taken away as slaves. They were ransomed after five years and the place fortified. It is now a centre of the tinned fishery, and there are manganese mines also. The coral banks, which were once important, are now exhausted. Three m. to the south-east is the island of S. Antico.

CARLOMAN (828-880), king of Bavaria and Italy, was the eldest son of Louis the German, king of the East Franks. In 856 he undertook the defence of the eastern frontier of Bavaria against the Bohemians and Slavians, who had been fighting in the same area, and was defeated by the Slavians near Jauer. He married a daughter of Ernest, count of the Bohemian mark, and in conjunction with his father-in-law resisted the authority of his father in 861. For some years he alternated between rebellion and submission to his father, but in 865 an arrangement was made by which he became possessed of Bavaria and Carinthia as his expectant share of the kingdom of Louis. During the troubles between Louis and his two younger sons Carloman remained faithful to his father, and carried on the war with the Moravians so successfully that in 870 their territory was completely under the power of the
Franks; and when peace was made at Forchheim in 874, they recognized the Frankish supremacy. In 875 the emperor Louis II. died, having named his cousin, Carloman, as his successor but Italy. Carloman crossed the Alps to claim his inheritance, but was cajoled by returning the king of the West Franks, Charles the Bald. In 876, on his father's death, Carloman became actually king of Bavaria, and after a short campaign against the Moravians he went again to Italy in 877 and was crowned king of the Lombards at Pavia; but his negotiations with Pope John VIII. for the imperial crown were fruitless, and personal illness added to the outbreak of an epidemic in his army compelled him to return to Bavaria. Stricken with paralysis, Carloman was unable to prevent his brother Louis from seizing Bavaria; so making a virtue of necessity, he bequeathed the whole of his lands to Louis. He died on the 22nd of September 880 at Ottingen, where he was buried, leaving an illegitimate son, afterwards the emperor Arnulf. See "Annales Fuldensis," "Annales Bertiniani," Regino von Prun, "Chronicon," all in the Monumenta Germaniae historica. Scriptores, Band i. (Hanover and Berlin, 1826-1892); E. Mühlbacher, Die Regesten des Kaiserreichs unter den Karolinger (Innsbruck, 1881); and E. Dümmler, Geschichte des ostfränkischen Reiches (Leipzig, 1887-1888).

CARLOMAN, the name of three Frankish princes.

1. Carloman (d. 754), mayor of the palace under the Merovingian kings, was a son of Charles Martel, and together with his brother, Pippin the Short, became mayor on his father's death in 711, administering the eastern part of the Frankish kingdom. He was successful in extending the power of the Franks in various wars with his troublesome neighbours, and was not less zealous in seeking to strengthen and reform the church in the lands under his rule. In 747 Carloman laid down his office and retired to a monastery which he founded on Monte Soracte, but troubled by the number of his visitors, he subsequently entered a monastery on Monte Casino. He died at Vienne on the 17th of August 754.

2. Carloman (751-771), king of the Franks, was a son of King Pippin the Short, and consequently a brother of Charlemagne. The brothers became joint kings of the Franks on Pippin's death in 768, and some trouble which broke out between them over the conduct of the war in Aquitaine was followed by Carloman's death at Samoussy on the 4th of December 771. He married Gerberga, a daughter of Desiderius, king of the Lombards, who, together with her children, vanished from history soon after her husband's death.

3. Carloman (d. 884), king of France, was the eldest son of King Louis IV. the Stutterer, and became king together with his brother Louis III., on his father's death in 879. Although some doubts were cast upon their legitimacy, the brothers obtained recognition and in 880 made a division of the kingdom, Carloman receiving Burgundy and the southern part of France. In 882 he became sole king owing to his brother's death, but the kingdom was in a very deplorable condition, and his power was very circumscribed. Carloman met his death while hunting on the 12th of December 884.

CARLOS I. (1863-1908), king of Portugal, the third sovereign of Portugal by the line of Braganza-Coburg, son of King Louis I. and Maria Pia, daughter of King Victor Emmanuel of Italy, was born on the 28th of September 1863. When about twenty years of age he spent a considerable time in travelling, visiting England in 1883. On the 22nd of May 1886 he married Marie Amélie, daughter of Philippe, duc d'Orléans, comte de Paris, and on the death of his father (19th of October 1886) he succeeded to the throne of Portugal. In that year the British government found it necessary to make formal remonstrances against Portuguese encroachments in South Africa, and relations between the two countries were greatly strained for some time. The king's attitude during this critical period was one of conciliation, and his temperate, though firm, speech opening the Cortes in January 1890 did much to strengthen the party of peace. In 1900-1901 also his friendly attitude towards Great Britain was shown by cordial toasts at a banquet to the officers of the British fleet at Lisbon. King Carlos distinguished himself as a patron of science and literature, and was himself an artist of some repute. In March 1894 he took a very active part in the celebration of the 500th anniversary of the birth of Prince Henry the Navigator, and a year later he decorated the Portuguese poet, João de Deus, with much honour at Lisbon. He took a great interest in deep-sea exploration and marine exploration, and published an account of some of his own investigations, the results themselves being shown at an oceanographic exhibition opened by him on the 12th of April 1897. In May 1907 the king suspended the constitution of Portugal and temporarily appointed Senhor Franco as dictator with a view to carrying out certain necessary reforms. Some discontent was aroused by this proceeding; this was increased by Franco's drastic measures, and on the 1st of February 1908 King Carlos and his elder son, Louis, duke of Braganza (1887-1908), were assassinated whilst driving through the streets of Lisbon. The king was succeeded by his only surviving son, Manuel, duke of Beja (b. 1889), who took the title of Manuel II.

See S. M. El Rei D. Carlos I. e sua obra artística e científica (Lisbon, 1908).

CARLOS, DON (1545-1568), prince of Asturias, was the son of Philip II. king of Spain, by his first wife Maria, daughter of John III., king of Portugal, and was born at Valladolid on the 8th of July 1545. His mother died a few days after his birth, and the prince, who was very delicate, grew up proud, willful and indolent, and soon began to show signs of insanity. In 1555 he was betrothed to a daughter of Henry II., king of France, a lady who a few months later became the third wife of his father; in 1560 he was recognized as the heir to the throne of Castile, and three years later to that of Aragon. Other brides were then suggested for the prince; Mary, queen of Scots, Margaret, another daughter of Henry II., and Anne, a daughter of the emperor Maximilian II.; but meanwhile his mental derangement had become much more acute, and his condition could no longer be kept secret. In 1562 he met with an accident which was followed by a serious illness, and after his recovery he showed more obvious signs of insanity, while his conduct both in public and in private was extremely vicious and disorderly. He took a marked dislike to the duke of Alva, possibly because he wished to proceed to the Netherlands instead of the duke, and he exhibited a morbid antipathy towards his father, whose murder he even contemplated. At length in January 1568, when he had made preparations for flight from Spain, he was placed in confinement by order of Philip, and on the 24th of July of the same year he died. This event is still enveloped in some mystery. Philip has been accused of murdering his son, and from what is known of the king's character this supposition is by no means improbable. It is known that the king appointed commissioners to try the prince, and he must and allen, Jo de de Campmartin in Andronic, and Lord John Russell have made it the subject of dramas, and other dramas based upon the life of Don Carlos have been written by Thomas Otway, M. A. Chénier, J. P. de Montalvan, and D. X. de Enciso.
See C. V. de Saint Réal, Don Carlos, nouvelle historique (Paris, 1872). This gives the story of the attachment of Carlos and Elizabeth, which has been refuted by L. von Ranke, Zur Geschichte des don Carlos (Vienna, 1839), and J. A. Llorente, Histoire critique de l’Inquisition (French translation, Paris, 1847). See also L. F. Gachard, Don Carlos et Philippe II (Brussels, 1863); C. de Moly, Don Carlos et Philippe II (Paris, 1863); M. Bödinger, Don Carlos, Haß und Tod (Vienna, 1891); L. A. Warnköig, Don Carlos, Leben, Verhüllung und Tod (Stuttgart, 1864); W. Maurenbrecher, Don Carlos (Berlin, 1876); and W. H. Prescott, History of the Reign of Philip II., vol. ii. (London, 1855, 1859).

Carlos, Don (1788–1855), the first of the Carlist claimants of the throne of Spain, was the second surviving son of King Charles IV. and his wife, Louisa Maria of Parma. He was born on the 29th of March 1788, and was christened Carlos Maria Isidro. From 1808 till 1814 he was a prisoner in France at Valenciennes with his brothers, who had been imprisoned by Napoleon when he seized the whole royal family of Spain at Bayonne. After his return he lived quietly as a prince at Madrid. In September 1816 he married Maria Francesca de Asis, daughter of King John VI. of Portugal, and sister of the second wife of his elder brother King Ferdinand VII. Though he took no part in the government of Spain, except to hold a few formal offices, Don Carlos is known for the harmony with which he agreed on the piety of his life, and his firm belief in the divine right of kings to govern despotically. During the revolutionary troubles of 1820–1823 he was threatened by the extreme radicals, but no attack was made on him. When the revolutionary agitation was put down by French intervention in 1823, Don Carlos continued to behave as the affectionate brother and loyal subject of Ferdinand VII. The family affection between them was undoubtedly sincere, and was one of the very few amiable traits in the character of the elder brother. Towards the close of Ferdinand’s reign Don Carlos was forced against his own will into the position of a party leader, or rather into the position of a prince whom a great party was forced to take as its leader. The extreme clericals among the Spaniards, who were the partisans of despotism because they rightly considered it as most favourable to the church, began to be discontented with King Ferdinand, which seemed wanting in energy. When the king showed his intention to alter the law of succession in order to secure the crown for his daughter Isabella, the clericals (in the Spanish phrase “apóstólicos”) banded to protect the rights of his daughter, whom they had hitherto been disposed to place himself at the head of an insurrection he would have been followed, and maybe have put Ferdinand under restraint. But Don Carlos held his principles honestly. He considered rebellion as a sin in a prince as much as in other men, and as wicked when made by “apóstólicos” as by liberals. He would do no more than assert his rights, and those of his children, in words. His wife and her sister, the princess of Beira, widow of his first cousin the infante Pedro, were less scrupulous. They were actively engaged in intrigues with the “apóstólicos.” In March 1833 the princess of Beira was informed by the king that her brother Don Miguel, then regent in Portugal, desired her presence, and that she must pay him a visit. On the 10th of March Don Carlos left for Portugal with his wife, in company with the princess, after an interview with his brother the king which is said to have been friendly. In the following month he was called upon by the king to swear allegiance to the infanta Isabella, afterwards queen. Don Carlos refused, in respectful terms but with great firmness, to renounce his rights and renounce the title of his brother the king. He then came to Madrid. The death of his brother on the 20th of September 1833 gave him an opportunity to vindicate his claims without offence to his principles, for in his own opinion and that of his partisans he was now king. But he was entangled in the civil war of Portugal and was shut off from Spain. He did, and perhaps could do, nothing to direct the Spaniards who rose on his behalf, and had proclaimed him king as Charles V. When the Miguelet party was beaten in Portugal, Don Carlos escaped to England on the 1st of June 1834 in H.M.S. “Donegal.” His stay in England was short. On the 2nd of July he passed over to France, where he was actively aided by the legitimist party, and on the 11th he joined his partisans at Elizondo in the valley of Bautan, in the western Pyrenees. On the 27th of October of this year he was deprived of his rights as infante by a royal decree, confirmed by the Cortes on the 15th of January 1837. Don Carlos remained in Spain till the defeat of his party, and then escaped to France on the 14th of September 1839. During these years he accompanied his armies, without displaying any of the qualities of a general or even much personal courage. But he endured a good deal of hardship, and was often compelled to take to hiding in the hills. On these occasions he was often carried over difficult places on the back of a stout guide commonly known as the royal jackass (burro real). The semblance of a court which he maintained was torn by incessant personal intrigues, and by conflicts between his generals and the ecclesiastics who exercised unbounded influence over his mind. The defeat of his cause, which had many chances of success, was unquestionably due to a very large extent to his want of capacity, his apathy, and his increasing absorption in practices of puerile piety. His first wife having died in England, Don Carlos married her elder sister, the princess of Beira, in Biscay in October 1837. After his flight from Spain, Don Carlos had no better consolation than to be deprived of his power. He died in May 1845, took a title of count of Molina, and died at Trieste on the 10th of March 1855.

By his first marriage, Don Carlos had three sons, Charles (1818–1861), (John (1822–1887), and Ferdinand (1824–1861). Charles succeeded to the claims of his father, and was known to his partisans as Don Carlos VI., but was more commonly known as the count of Montemolin. In 1846, when the marriage of queen Isabella was being negotiated, the Austrian government endeavoured to arrange an alliance between her and the count of Montemolin. But as he insisted on the complete recognition of his rights, the Spanish government refused to hear of him as a candidate. The Carlists took up arms on his behalf between 1846 and 1848, but the count, who had been expelled from France by the police, did not join them in the field. In April 1846 he and his brother Ferdinand landed at San Carlos de la Rápita, at the mouth of the Ebro, in company with a feather-headed officer named Ortega, who held a command in the Balearic islands. They hoped to profit by the fact that the bulk of the Spanish army was absent in a war with Morocco. But the Carlists were not well blooded. The men who had been brought from the islands by Ortega deserted him. Montemolin and his brother, together with their devoted partisan General Elío, who had accompanied them from exile, lurked in hiding for a fortnight and were then captured. Ortega was shot, but the princes saved their lives, and that of Elío, by making an abject surrender of their claims. When he had been allowed to escape and had reached Cologne, the count of Montemolin publicly retracted his renunciation on the 1st of June, on the ignominious ground that it had been extorted by fear. Montemolin and his brother Ferdinand died within a fortnight of one another in January 1861 without issue.

The third brother, John, who had advanced his own claims before his brother’s retraction, now came forward as the representative of the legitimist and Carlist cause. As he had shown a disposition to accept liberalism, and to make concessions to the spirit of the age, he was unpopular with the party. On the 3rd of October 1868 he made a formal renunciation in favour of his son Charles (Don Carlos VII.), who is separately noticed below.

See Herman Baumgarten, Geschichte Spaniens (Leipzig, 1867); H. Butler Clarke, Modern Spain (Cambridge, 1906), which contains a useful bibliography.

Carlos, Don (Charles María de los Dolores Juan Isidore Joseph Francis Quinton Antony Michael Gabriel Raphael) (1848–1909), prince of Bourbon, claimant as Don Carlos VII., to the throne of Spain, was born at Laibach on the 30th of March 1848, being the eldest surviving son of Don Juan (John) of Bourbon and of the archduchess Maria Beatriz, daughter of Francis IV., duke of Modena. Don Carlos was the grandson of the first pretender, noticed above. He married in February 1867, at Frohsdorf, Princess Marguerite, daughter of the duke of Parma and niece of the comte de Chambord, who was born on the 1st
of January 1847, and who bore him a son, Don Jaime, in 1870, and three daughters. Don Carlos boldly asserted his pretensions to the throne of Spain two years after the revolution of 1868 had driven Queen Isabella II. and the other branch of the Bourbons into exile. His manifesto, addressed to his brother Alphonso, pamesake of his rival, Alphonso XII., found an echo in the fanatical priesthood and penantry of many provinces of the Peninsula, but little support among the more enlightened middle classes, especially in the towns. The first rising was started in Catalonia by the brother of the pretender, who himself entered Spain by way of Vera, in the Basque provinces, on the 21st of May 1872. The troops of King Amadeus under General Moriones, a progressist officer, who was one of Spain's ablest and most popular commanders, surprised and very nearly captured thepretender at Oroquista, sending him a fugitive to France in headlong flight with a few followers. For more than a year he loitered about in the French Pyrenees, the guest of old noble houses who showed him much sympathy, while the French authorities winked at the fact that he was fomenting civil war in Spain, where his guerrilla bands, many of them led by priests, committed atrocities, burning, pillaging, shooting prisoners of war, and not unfrequently ill-using even foreign residents and destroying their property. When the Federal Republic was proclaimed on the abdication of King Amadeus, the Carlists had overrun Spain to such an extent that they held all the interior of Navarre, the three Basque provinces, and a great part of Catalonia, Lower Aragon, and Valencia, and had made raids into the provinces of Old Castile and Estremadura. Don Carlos re-entered Spain on the 15th of July 1872, just before the Carlists took Estella, in Navarre, which became, with Tolosa and Durango in the Basque provinces, his favourite residence. He displayed very lax morals and an apathy which displeased his staff and partisans. Don Carlos was present at some fights around Estella, and was in the neighbourhood of Bilbao during its famous siege of three months in 1874 until its relief by Marshals Serrano and Concha on the 2nd of May. He was also present at the battle near Estella on the 27th of June 1874, in which Marshal Concha was killed and the liberals were repulsed with much loss. Twice he lost golden opportunities of making a rush for the capital—in 1873, during the Federal Republic, and after Concha's death. From the moment that his cousin Alphonso XII. was proclaimed king at Sagunto, at Valencia, in Madrid, and at Logroño, by General Campos, Daban, Jovellar, Primo de Rivera, and Laserna, the star of the pretender was on the wane. Only once, a few weeks after the Alphonstist restoration, the army of Don Carlos checked the Liberal forces in Navarre, and surprised and made prisoners half a brigade, with guns and colours, at Lacar, almost under the eyes of the new king and his headquarters. This was the last Carlist success. The tide of war set in favour of Alphonso XII., whose armies swept the Carlist bands out of central Spain and Catalonia in 1875, while Marshal Quesada, in the upper Ebro valley, Navarre, and Ulva, prepared by a series of successful operations the final advance of 180,000 men, headed by Quesada and the king, which defeated the Carlists at Estella, Peña Plata, and Eguetea, thus forcing Don Carlos with his forces to the Pyrenees of Bardenas to garnet and surrender to the French frontier authorities in March 1876.

The pretender went to Pau, and there, singularly enough, issued his proclamations bidding temporary adieu to the nation and to his volunteers from the same chateau where Queen Isabella, also a refugee, had issued hers in 1868. From that date Don Carlos became an exile and a wanderer, travelling much in the Old and New World, and raising some scandal by his mode of life. He fixed his residence for a time in England, then in Paris, from which he was expelled at the request of the Madrid government, and next in Austria, before he took up his abode at Viareggio in Italy. Like all pretenders, he never gave in, and his pretensions, haughtily reasserted, often troubled the courts and countries whose hospitality he enjoyed. His great disappointment was the coldness towards him of Pope Leo XIII., and the favour shown by that pontiff for Alphonso XII. and his godson, Alphonso XIII. Don Carlos had two splendid chances of testing the power of his party in Spain, but failed to profit by them. The first was when he was invited to unfurl his flag on the line of Alphonso XII, when the perplexities and uncertainties of Castilian politics reached a climax during the first year of a long minority under a foreign queen-regent. The second was at the close of the war with the United States and after the loss of the colonies, when the discontent was so widespread that the Carlists were able to assure their prince that many Spaniards looked upon his cause as the one untired solution of the national difficulties. Don Carlos showed his usual lack of decision; he wavered between the advice of those who told him to unfurl his standard with a view to rally all the discontented and disappointed, and of those who recommended him to wait until a great pronunciamiento, chiefly military, should be made in his favour—a day-dream founded upon the coquetting of General Weyler and other officers with the Carlist senators and deputies in Madrid. Afterwards the pretender continued to ask his partisans to go on organizing their forces for action some day, and to push their propaganda and preparations, which was easy enough in view of the indulgence shown them by all the governments thereby ready to open a door insensibly by many of the priesthood, especially in the rural districts, the religious orders, and the Jesuits, swarming all over the kingdom. After the death of his first wife in 1893, Don Carlos married in the following year Princess Marie Bertha of Rohan. He died on the 18th of July 1909. His son by his first wife, Don Jaime, was educated in Austrian and British military schools before he entered the Russian army, in which he became a colonel of dragoons.

CARLOW, a county of Ireland in the province of Leinster, bounded N. by the counties Kildare and Wicklow, E. by Wicklow and Wexford, S. by Wexford, and W. by Queen's county and Kilkenny. Excepting Louth, it is the smallest county in Ireland, having an area of 221,424 acres, or about 346 sq. m. The surface of the county is in general level or gently undulating, and of pleasing appearance, except the elevated tract of land known as the ridge of Old Leighlin (Gallows Hill Bog, 974 ft.), forming the beginning of the coal-measures of Leinster, and the south-eastern portion of the county, bordering on Wexford, where the wild and barren granitic elevations of Knockroe (1757 ft.) and Mount Leinster (2610 ft.) present a bolder aspect. Glacial deposits, which overspread the lower grounds, sometimes afford good examples of the ridge-forms known as eskers, as in the neighbourhood of Bagenalstown. There are no lakes nor canals in the county, nor does it contain the source of any important river; but on its western side it is intersected from north to south by the Barrow, which is navigable throughout the county and affords means of communication with the port of Waterford; while on the eastern border the Slaney, which is not navigable in any part of its course through the county, passes out of Carlow into Wexford at Newtowmerry.

Carlow is largely a granite county; but here the Leinster Chain does not form a uniform moorland. The mica-schists and Silurian slates of its eastern flank are seen in the diversified and hilly country on the pass over the shoulder of Mt. Leinster, between Newtowmerry and Borris. The highlands, which are laid westward of the valley of the Barrow, extending from Carlow and Bagenalstown lying on Carboniferous Limestone, which here abuts upon the granite. On the west of the hollow, the high edge of the Castlecomer coalfields rises, sparcps of limestone, grit, and coal-measures succeeding one another on the ascent. Formerly clay-frontstone was raised from the Upper Carboniferous strata.

The soil is of great natural richness, and the country is among the most generally fertile in the island. Agriculture is the chief occupation of the inhabitants, but is not so fully developed as the capabilities of the land would suggest; in fact, the extent of land under tillage shows a distinctly retrograde movement, being rather more than half that under pasture. The pasture land is of excellent quality, and generally occupied as dairy farms, the butter made in this county maintaining a high reputation in the Dublin market. The farms are frequently large, and care is given to the breeding of cattle. Sheep and poultry, however, receive the greatest attention. The staple trade of the county is
in corn, flour, meal, butter and provisions, which are exported in large quantities. There are no manufactures. The sandstone of the county is frequently of such a nature as to split easily into layers, known in commerce as Carlow flags.

Porcelain clay exists in the neighbourhood of Tullow; but no attempt is made to turn this product to use.

The Great Southern & Western railway from Kildare to Wexford follows the river Barrow through the county, with a branch from Bagenalstown to Kilkenny, while another branch from the north terminates at Tullow.

As regards population (41,094 in 1801; 37,748 in 1901), the county shows a decrease among the more serious of Irish counties, and correspondingly heavy emigration returns. Of the total, about 89% are Roman Catholics, and nearly the whole are rural. Carlow (pop. 6513), Bagenalstown (1882), and Tullow (1725) are the only towns. The county is divided into seven baronies, and contains forty-four civil parishes and parts of parishes. It belongs to the Protestant diocese of Dublin and the Roman Catholic diocese of Kildare and Leighlin. The assizes are held at Carlow, and quarter sessions at that town and also at Bagenalstown and Tullow. One member is returned to parliament.

Carlow, under the name of Catherloge, is among the counties generally considered to have been created in the reign of John. Leinster was confirmed as a liberty to William Marshal, earl of Pembroke, by John, and Carlow, among other counties in this area, had the privileges of a palatinate on descending to one of the earl's heiresses. The relics of antiquity in the county comprise large cromlechs at Browne's Hill near Carlow and at Hacketstown, and a rath near Leighlin Bridge, in which were found several urns of baked earth, containing only small quantities of dust. Some relics of ecclesiastical and monastic buildings exist, and also the remains of several castles built after the English settlement. Old Leighlin, where the 12th century cathedral of St Lazerian is situated, is merely a village, although until the Union it returned two members to the Irish parliament.

CARLOW, the county town of Co. Carlow, Ireland, on the navigable river Barrow. Pop. of urban district (1901) 6513. It is 56 m. S.W. of Dublin by the Great Southern & Western railway. The castle (supposed to have been founded by Hugh de Lacy, appointed governor of Ireland in 1179, but sometimes attributed to Henry II., situated on an eminence overlooking the river, is still a chief feature of attraction in the general view of the town, although there is not much of the original building left. It consisted of a hollow quadrangle, with a massive round tower at each angle. The principal buildings are the Roman Catholic College of St Patrick (1793), a plain but spacious building in a picturesque park adjoining the Roman Catholic cathedral of the diocese of Kildare and Leighlin; the Protestant parish church, with a handsome steeple of modern erection; the court-house, where the assizes are held, an octagonal stone building with a handsome Ionic portico; and other county buildings. The cathedral, in the Perpendicular style, has a highly ornamented west front, and a monument to Bishop James Doyle (d. 1834). The Wellington Bridge over the river Barrow connects Carlow with the suburb of Graigue. Two m. N.E. of the town is one of the finest cromlechs in Ireland, and 3 m. to the west is the notable church, of Norman and pre-Norman date, of Killeshin in Queen's county. The industries of Carlow consist of brewing and flour-milling, and a considerable trade is carried on in the sale of butter and eggs.

Carlow was of early importance. In the reign of Edward III., the king's exchequer was removed thither, and £500, a large sum at that period, applied towards surrounding the town with a strong wall. In the early part of the reign of Queen Elizabeth the castle was taken, and the town burned by the Irish chieftain, Rory Oge O'Morc. When summoned to surrender by Ireton, the Commonwealth general, during the war of 1641, Carlow submitted without resistance. In the insurrection of 1798 the castle was attacked by an undisbcdisciplined body of insurgents. They were speedily repulsed, and suffered severe loss, no quarter being given; and, in the confusion of their flight, many of the insurgents took refuge in houses, which the king's troops immediately set on fire. Carlow obtained the charter of incorporation as early as the 14th century, and was reincorporated, with enlarged privileges, by James L. The corporation, which was styled "The Sovereign, Free Burgesses and Commonalty of the Borough of Catherloge," was authorized to return two members to the Irish parliament. The town returned one member to the Imperial parliament until 1885.

CARLSBAD, or KAISER-KARLSBAD (Czech, Karlovy Vary), a town and celebrated watering-place of Bohemia, Austria, 116 m. W.N.W. of Prague by rail. Pop. (1900) 14,640. It is situated at an altitude of 1227 ft. and lies in the beautiful narrow and winding valley of the Tepl at its junction with the Eger, being hemmed in by precipitous granite hills, covered with magnificent forests of pine. The town is spread on both banks of the river and in the valley of the Eger, its houses being built up the mountain sides in tier above tier of terraces approached by long flights of steps or steep and tortuous roads. This irregularity of site and plan, together with the varied form and high-pitched roofs of the houses, makes the place very picturesque. Among the principal buildings of Carlsbad are the Catholic parish church, built in 1732-1736 in rocco style; the gorgeous Kurhaus; a church, the Renaissance Saxon hall, and a handsome synagogue. In the first rank of the other buildings stands the famous Mühlbrunnen Colonnade, erected between 1871 and 1878, which, with its 103 monolithic granite Corinthian columns, is a fine example of modern classical architecture; the Kurhaus (1865); the magnificent Kaiserbad, built in 1895 in the French Renaissance style, and several other bathing establishments; the Sprudel Colonnade, an imposing iron and glass structure, built in 1879, within which rises the Sprudel, the principal spring of Carlsbad; and several hospitals and hospices for poor patients. Both banks of the Tepl are provided with quais, planted with trees, which constitute the chief promenades of the centre of the town; and there are, besides, a municipal park and several public gardens.

The mineral springs, to which Carlsbad owes its fame, rise from beneath a very hard kind of rock, known as Sprudelschale or Sprudeldecke, beneath which it is believed that there exists a large common reservoir of the hot mineral water, known as the Sprudelkessel. Several artificial apertures in the rock have been opened for the supply of the springs, and the water is drawn in a cauldron, which, owing to the incrustations deposited by the water, require to be cleared at regular intervals. Altogether there are seventeen warm springs, with a temperature varying from 164° F. to 107-7° F., and two cold ones. The oldest, best-known, and at the same time the most copious spring is the Sprudel, a hot geyser with a temperature of 164° F., which gushes up in jets of 1½ ft. thick to a height of about 2½ ft., and delivers about 405 gallons of water per minute. Other springs are the Mühlbrunnen, with a temperature of 121° F., which is after the Sprudel the most used spring; the Neubrunnen (188° F.); the Kaiser-Karl-Quelle (114° F.); the Theresienbrunnen (134° F.), &c. The warm springs belong to the class of alkaline-saline waters and have all the same chemical composition, varying only in their degree of temperature. The chemical composition of the Sprudel, taken to a thousand parts of water, is: 2-905 sulphate of soda, 1-288 bicharbonate of soda, 1-045 chloride of soda, 0-186 sulphate of potash, 0-166 bicharbonate of magnesia, 0-012 bicharbonate of lithium, and 0-066 carbonic acid gas. They contain also traces of arsenic, antimony, selenium, rubidium, iron, and manganese, and the water is imperceptibly acidodourless, with a slightly acidulated and salt taste, and has a specific gravity of 1-0053 at 64·9° F. The waters are used both for drinking and bathing, and are very beneficial in cases of liver affections, bilary and renal calculi, diabetes, gout, rheumatism, and uric acid troubles. They are very powerful in their effect and must not be used except under medical direction, and during the cure, a carefully-regulated diet must be observed, coupled with a moderate amount of exercise in the open air. The number of visitors in 1901 was 51,454; in 1756 it was only 257; in 1828 it was 37,123; and it attained 14,182 in 1869, and 34,356 in 1890.
Carlsbad is encircled by mountains, covered with beautiful forests of pine, which are made accessible by well-kept paths. Just above the town towers the Hirschensprung (1620 ft.), a little farther the Freundschaftshöhe (1722 ft.); the Franz-Josefs-Höhe (1665 ft.); and the Aberg (1980 ft.). On the opposite bank of the Tepl lies the Rudolfshöhe (1379 ft.); the Drelkreuzberg (1805 ft.); the König Otto's Höhe (1560 ft.); and the Erviges Leben (2086 ft.), with the Stephaniwarte, a tower, 98 ft. high, built in 1886, which commands a superb view. The town is the centre of the porcelain and stoneware industry of Bohemia, and manufactures a special liqueur (Karlšbad Bitter), besides various objects from the Sprudel rock and confectionery. It exported, in 1901, 2,4 millions of bottles of mineral water, and 160,000 lb. of Sprudel salt, i.e. salt obtained by evaporation from the water of the Sprudel.

Many interesting places are to be found near Carlsbad. To the north is the village of Dallwitz, with a porcelain factory, a handsome castle and beautiful oaks extolled by Theodor Körner, under which he composed in 1812 his touching elegy on the downfall of Germany. To the east is the watering-place of Giesshübl-Puchstein with celebrated springs, which contain alkaline waters impregnated with carbonic acid gas. To the west in the valley of the Erger, the village of Aich, with a porcelain factory, and a little farther the much-visited Hans Heiling's Rock, a wild and romantic spot, with which a very touching legend is connected: To the south-east the ruined castle of Engelhaus, situated on a rock of phonolite, 2340 ft. high, built probably in the first part of the 13th century and destroyed by the Swedes in 1635. At the foot of the mountain lies the actual village of Engelhaus.

According to legend the springs of Carlsbad were discovered during a hunting expedition by the emperor Charles IV., who built the town, which derives its name from him, on both banks of the Tepl. But the hot springs were already known two centuries before, as is indicated by the name of the river Tepl (water of burning), which name the river was known in the 12th century. Besides, on the same spot stood already in the 13th century a place called Vary, which means the Sprudel. The truth is, that the emperor Charles IV., after being cured here, built about 1358 a castle in the neighbourhood and accorded many privileges to the town. It obtained its charter as a town in 1370; the fame of the waters spread and it was created a royal free town in 1707 by the emperor Joseph I. The waters were used only for bathing purposes until 1520, when they began to be prescribed also for drinking. The first Kurhaus was erected in 1711 near the Mühlbrennen, and was replaced by a larger one, built in 1701 by the empress Maria Theresa. Carlsbad was nearly completely destroyed by fire in 1604, and another great fire raged here in 1759. It also suffered much from inundations, especially in 1382 and 1890. In August 1819 a meeting of the ministers of the German courts took place here under the presidency of Prince Metternich, when many reactionary measures, embodied in the so-called "Carlsbad Decrees" (see below), were agreed upon and introduced in the various states of the German Confederation.

Among the extensive literature of the place see Mannl, Carlsbad and its Mineral Springs (Leipzig, 1850); Cartellieri, Karlshals als Kurort (Carlsbad, 1888); Friedenthal, Der Kurort Karlshals Topographisch und Medizinisch (Karlshals, 1895).

**CARLSBAD DECREES** (Karlšbad Beschlüsse), the name usually given to a series of resolutions (Beschlüsse) passed by a conference of the ministers and envoys of the more important German states, held at Carlsbad from the 6th to the 31st of August 1819. The occasion of the meeting was the desire of Prince Metternich to take advantage of the consternation caused by recent revolutionary outrages (especially the murder of the dramatist Kotzebue by Karl Sand) to persuade the German governments to combine in a system for the suppression of the Liberal agitation in Germany. The pretended urgency of the case served as the excuse for only inviting to the conference those states whose ministers happened to be visiting Carlsbad at the time. The conferences were, therefore, actually attended by the representatives of Austria, Prussia, Saxony, Bavaria, Württemberg, Hanover, Baden, Nassau and Mecklenburg; at the fourth conference (August 9th) Baron von Fritsche, minister of state for Saxe-Weimar, who "happened to be present" at Carlsbad on that day, attended by special invitation. Prince Metternich presided over the conferences, and Friedrich von Gentz acted as secretary.

The business to be discussed, as announced in Metternich's opening address, was twofold: (1) Matters of urgent importance necessitating immediate action; (2) Questions affecting the fundamental constitution of the German Confederation, demanding more careful and prolonged discussion. To the first class belonged (a) the urgent necessity for a uniform system of press regulation in Germany; (b) the most urgent measures in regard to the supervision of universities and schools; (c) measures in view of the already discovered machinations of the political parties. To the second class belonged (a) the more clear definition of article XIII. of the Act of Confederation (i.e. state constitutions); (b) the creation of a permanent federal supreme court; (c) the creation of a federal executive organization (Bundes-Exekutions Ordnung) armed with power to make the decrees of the diet and the judgments of the high court effective; (d) the facilitation of commercial intercourse within the confederation in accordance with article XIX. of the Act of Confederation (Beilage A. zum ersten Protokoll, Martens, iv. p. 74).

These questions were debated in twenty-three formal conferences. On the issues raised by the first class there was practical unanimity. All were agreed that the state of Germany demanded disciplinary measures, and as the result of the deliberations it was determined to lay before the federal diet definite proposals for (1) a uniform press censorship over all periodical publications; (2) a system of "curators" to supervise the education given in universities and schools, with disciplinary enactments against professors and teachers who should use their position for purposes of political propaganda; (3) the erection of a central commission at Mainz, armed with inquisitorial powers, for the purpose of preventing and exposing revolutionary conspiracy, the existence of which was assumed.

On the questions raised under the second class there was more fundamental difference of opinion, and by far the greater part of the time of the conference was occupied in discussing the burning question of the due interpretation of article XIII. The controversy raged round the distinction between "assemblies of estates," as laid down in the article, and "representative assemblies," such as had been already established in several German states. Gentz, in an elaborate memorandum (Nebenbeilage zum siebenten Protokoll, iv. p. 102), laid down that representation by estates was the only system compatible with the conservative principle, as the "outcome of a well-ordered civil society, in which the relations and rights of the several states are due to the peculiar position of the classes and corporations on which they are based, which have been from time to time modified by law without detracting from the essentials of the system"; whereas "representative assemblies are based on the "sovereignty of the people.""

To this, Count Wintzingerode, on behalf of the king of Württemberg, placed on record (Nebenbeilage 2 zum neunten Protokoll, p. 147) a protest, in which he urged that to insist on the system of estates would be to stereotype caste distinctions foreign to the whole spirit of the age, would alienate public opinion from the governments, and—if enforced by the central power—would violate the sovereign independence of those states which, like Württemberg, had already established representative constitutions.

Though the majority of the ministers present favoured the Austrian interpretation of article XIII. as elaborated by Gentz, they were as little prepared as the representative of Württemberg to agree to any hasty measures for strengthening the federal government at the expense of the jealously guarded prerogatives of the minor sovereignties. The result was that the constitutional questions falling under the second class were reserved for further discussion at a general conference of German ministers to be summoned at Vienna later in the year. The
CARLSTADT

effective Carlsbad resolutions, subsequently issued as laws by the federal diet, were therefore only those dealing with the "revolutionary" agitation. For the results of their operation see Germany: History.

The acts, protocols and resolutions of the conference of Carlsbad are given in M. de Martens's Nouveau Recueil général de traités, &c., t. 4, pp. 8-166 (Göttingen, 1846). An interesting criticism of the Carlsbad Decrees is appended (p. 166), addressed by Baron Hans von Pohlen, Mecklenburg representative in the federal diet, to Baron von Pohlen, Mecklenburg plenipotentiary at the conference of Carlsbad. (W. A. P.)

CARLSTADT, CARLSTAD or KARLOSTAD (1480-1541), German reformer, whose real name was Andreas Rudolf Bodenstein, was born at Carlsbad in Bohemia. He entered the university of Erfurt in the winter term of 1499-1500, and remained there till 1503, when he went to Cologne. In the winter term of 1504-1505 he transferred himself to the newly founded university of Wittenberg, where he soon established his reputation as a teacher of philosophy, and a zealous champion of the scholastic system of Thomas Aquinas, against the revised nominalism associated with the name of Ockam. In 1508 he was made canon of the Alterheiligenstift, a collegiate church incorporated in the university; in 1516 he took the foundation of theology and his duties being to preach, to say mass once a week and to lecture before the university; in 1515 he was appointed ordinary professor of theology. In 1515 he went to Rome, where with a view to becoming provost of the Alterheiligenstift he studied law, taking his degree as doctor juris utriusque. His experiences in the papal city produced upon him the same effect as upon Luther, and when in 1516 he returned to Germany it was as an ardent opponent of the Thomist philosophy and as a champion of the Augustinian doctrine of the impotence of the human will and salvation through Divine grace alone. The 151 theses of Carlstadt, dated the 16th of September 1516, discovered by Theodor Kolde ("Wittenbergh Disputations-thesen" in Zeitschrift für Kirchengeschichte, xi. p. 449, &c.), prove that, so far from owing his change of view to Luther's influence, he was at this time actually in advance of Luther. The two reformers were, in fact, never friends; though from the end of 1516 onwards the development of each was considerably influenced by the other.

In the spring of 1518, in reply to Eck's Obelisc, an attack on Luther's Theology, Carlstadt published a series of theses, maintaining the supremacy of the Holy Scriptures (which he regarded as verbally inspired) over ecclesiastical tradition and the authority of the fathers, and asserting the liability of general councils to error. Eck challenged him to a public disputation, in which Luther also took part, and which lasted from the 27th of June to the 15th of July 1519. In this dialectical warfare Carlstadt was no match for Eck; but the dispute only served to confirm him in his revolt from the dominant theology, and in three violent polemical treatises against Eck he proclaimed the doctrine of the exclusive operation of grace in the justification of believers.

This attitude led him in 1520, by a logical development, to an open attack on all those ecclesiastical practices in which the doctrine of justification by works had become crystallized; e.g. indulgences and the abuse of holy water and consecrated salt. At the same time he appeared as the first of modern biblical critics, denying the Mosaic authorship of the Pentateuch and classing the Scriptures into three categories of different value in accordance with the degrees of certainty as to their traditional origin. He still, however, maintained the doctrine of verbal inspiration, and attacked Luther for rejecting the epistle of James. In 1520 Carlstadt's name was included in the papal bull excommunicating Luther; after a momentary hesitation he decided to remain firm in his protestant attitude, published an appeal from the pope to a general council, and attacked the corruptions of the papacy itself in a treatise on "the holiness of the pope" (Von päpstlicher Heiligkeit, October 17th, 1520). In May 1521 Carlstadt went to Denmark, on the invitation of King Christian II., to assist in the reform of the church; but his disposition was anything but conciliatory, and, though his influence is traceable in the royal law of the 26th of May 1521 abolishing the celibacy of the clergy, he was forced, by the hostility of nobles and clerks alike, to leave after a few weeks' stay.

In June he was back in Wittenberg, busy with tracts on the Holy Sacrament (he still believed in the corporeal presence) and against the celibacy of the clergy (de coelibatu). Carlstadt has been unjustly accused of being responsible for the riots against the Mass fomented by the Augustinian friars and the students; as a matter of fact, he did his best to keep the peace, pending a decision by the elector of Saxony and the authorities of the university, and it was not till Christmas day that he himself publicly communicated the laity under both species. The next day he announced his engagement to a young lady of noble family, Anna von Mochau.

From this moment Carlstadt was accepted as the leader of Protestantism in Wittenberg; and, at his instance, auricular confession, the elevation of the Host and the rules for fasting were abolished. On the 9th of January he was married, in the presence of many of the university professors and city magistrates. A few days later the property of the religious corporations was confiscated by the city and, after pensions had been assigned to their former members, was handed over to private individuals. A few days afterwards Carlstadt's name was removed from pictures and images, supported by the town, also led to iconoclastic excesses.

The return of Luther early in March, however, ended Carlstadt's supremacy. The elector Frederick the Wise was strenuously opposed to any alteration in the traditional services, and at his command Luther restored communion in one kind and the elevation of the Host. Carlstadt himself, though still professor, was deprived of all influence in practical affairs, and devoted himself entirely to theological speculation, which led him ever nearer to the position of the mystics. He now denied the necessity for a clerical order at all, called himself "a new layman," donned his ecclesiastical dress, and lived for a while as a peasant with his wife's relations at Segrena. In the middle of 1523, however, he went to Orlamünde, a living held by him with his canonry, and there in the parish church reformed the services according to his ideas, abolishing the Mass and even preaching against the necessity for sacraments at all. He still continued occasionally to lecture at Wittenberg and to formulate against Luther's policy of compromise.

All this brought him into violent conflict with the elector, the university and Luther himself. His professorship and living were confiscated and, in September 1524, he went into exile with his wife and child. He was now exposed to great privations and hardships, but found opportunity for polemical writing, proclaiming for the first time his disbelief in the "Real Presence." He preached wherever he could gain a hearing, and visited Strassburg, Heidelberg, Zürich, Basel, Schweinfurth, Kitzingen and Nördlingen, before he found a more permanent resting-place at Rothenburg on the Tauber. He was here when the Peasants' War broke out, and was sent as a delegate to reason with the insurgents. His admonitions were unsuccessful, and he only succeeded in bringing himself under suspicion of being in part responsible for their excesses. When Rothenburg was taken by the margrave of Anspach (8th June 1525) Carlstadt had to fly for his life. His wife, Anna, with a son, Stephan, was captured and, as a mark of reverence to Luther humbly praying him to intercede for him with the elector. Luther agreed to do so, on receiving from Carlstadt a recantation of his heterodox views on the Lord's Supper, and as the result the latter was permitted to return to Wittenberg (1525). He was not, however, allowed to lecture, and he lived as a peasant, first at Segrena and afterwards at Bergwitz, cultivating small properties, in which he had invested the remnant of his fortune, with such poor success that at the end of 1526 he had to eke out a living as a pedlar in the little town of Kemberg. This was endurable; but not so the demand presently made upon him to take up the cudgels against Zwingli and Oecolampadius. Once more he revolted; to agree with "Dr Martin's opinions on the sacrament" was as difficult as flying like a bird; he appealed to the elector to allow him to leave Saxony; but the elector's conscience was in Luther's
CARLYLE, A.—CARLYLE, THOMAS

keeping, and Carlsbad had to fly ignominiously in order to avoid imprisonment. He escaped to Holstein, where in March 1529 he stayed with the Anabaptist Melchior Hofmann. Expelled by the authorities, he took refuge in East Friesland, where he remained till the beginning of 1530 under the protection of a nobleman in sympathy with the Heltic reformers. His preaching gave him great influence, but towards the close of the year persecution again sent him on his travels. He ultimately reached Zürich, where the recommendations of Bucer and Oecolampadius secured him a friendly reception by Zwingli, who procured him employment. After Zwingli's death he remained in close intercourse with the Zürich preachers, who defended him against renewed attacks on Luther's part; and, finally, in 1534, on Bullinger's recommendation, he was called to Basel as preacher at the church of St Peter and professor at the university. Here he remained till his death on the 24th of December 1541.

During these latter years Carlsbad's attitude became more moderate. His championship of the town council against the theocratic claims of Antistes Myconius and the ecclesiastical, in the matter of the control of the university, was perhaps in consonance with his earlier views on the relations of clergy and laity. He was, however, also instrumental in restoring the right of the laity to sit in other degrees; and, despatched on a mission to Strassburg in 1536, to take part in discussion on a proposed compromise in the matter of the Lord's Supper between the theologians of Strassburg and Wittenberg, he displayed a conciliatory attitude which earned him the praise of Bucer. Carlsbad's historical significance lies in the fact that he was one of the pioneers of the Reformation. But he was a thinker and dreamer rather than a man of affairs, and though he had the moral and physical courage to carry his principles to their logical conclusions (he was the first priest to write against celibacy, and the first to take a wife), he lacked the balance of mind and sturdy common sense that inspired Luther's policy of consideration for "the weaker brethren" and built up the Evangelical Church on a conservative basis. But though Carlsbad was on friendly terms and corresponded with Münzer and other Anabaptists, he did not share their antinomian views, nor was he responsible for their excesses. His opinion as to the relation of faith and "good works" was practically that expressed in articles XI. and XII. of the Church of England. In answer to Luther's violent criticisms of the prophecy of the Book of Daniel he issued from Rothenburg his "Anregung etlicher Hauptrichtikel christlicher Lehre", a compendious exposition of his views, in which he says: "Those who urge to good works do so, not that the conscience may be justified by works, but that their freedom may reek to God's glory and that their neighbours may be fired to praise God."

See C. F. Jaeger, Andreas Bodenstein von Karlsbad (Stuttgart, 1886); Hermann Barge, Andreas Bodenstein von Karlsbad, vols. 1 (Leipzig, 1905).

CARLYLE, ALEXANDER (1722-1803), Scottish divine, was born on the 26th of January 1722, in Dumfriesshire, and passed his youth and early manhood at Prestonpans, where he witnessed the battle of 1745. He was educated at Edinburgh (M.A. 1743), Glasgow and Leiden. From 1748 until his death on the 28th of August 1803 he was minister at Inveresk in Midlothian, and during this long career rose to high eminence in his church not only as leader of the moderate or "broad" Church section, but as moderator of the General Assembly 1770 and 1779. He was also a valuable assistant to his brother John Home in his work, and his influence was enhanced by his personal appearance, which was so striking as to earn him the name of "Jupiter Carlyle"; and his autobiography (published 1800), though written in his closing years and not extending beyond the year 1770, is abundantly interesting as a picture of Scottish life, social and ecclesiastical, in the 18th century.

Carlyle's memory recalled the Porteous Riots of 1756, and less remotely his friendship with Adam Smith, David Hume, and John Home, the dramatist, for witnessing the performance of whose tragedy Douglas he was censured in 1757. He was distinctly a bon vivant, but withal an upright, conscientious and capable minister.

CARLYLE, JOSEPH Dacre (1759-1804), British orientalist, was born in 1759 at Carlisle, where his father was a physician. He went in 1775 to Cambridge, was elected a fellow of Queens' College in 1779, taking the degree of B.D. in 1782. With the assistance of a native of Bagdad known in England as David Zamio, then resident at Cambridge, he attained great proficiency in Arabic literature; and after succeeding Dr Paley in the chancellorship of Carlisle, he was appointed, in 1795, professor of Arabic in Cambridge University. His translation from the Arabic of Yusuf ibn Taghri Birdi, the Rerum Egyptiacarum Annales, appeared in 1792, and in 1796 a volume of Specimens of Arabic Poetry, from the earliest times to the fall of the Caliphate, with some account of the authors. Carlyle was appointed chaplain by Lord Elgin to the embassy at Constantinople in 1799, and prosecuted his researches in Eastern literature in a tour through Asia Minor, Palestine, Greece and Italy, collecting in his travels several valuable Greek and Syriac MSS. for a projected critical edition of the New Testament, collated with the Syriac and other versions—a work, however, which he did not live to complete. On his return to England in 1801 he was presented by the bishop of Carlisle to the living of Newcastle-on-Tyne, where he died on the 12th of April 1804. After his death there appeared a volume of poems descriptive of the scenes of his travels, with prefatory and postscriptual remarks from a journal. Among other works which he left unfinished was an edition of the Bible in Arabic, compiled by H. Ford and published in 1811.

CARLYLE, THOMAS (1795-1881), British essayist, historian and philosopher, born on the 4th of December 1795 at Ecclefechan, in Annandale, was the eldest of the nine children of James Carlyle by his second wife, Janet Aitken. The father was by trade a mason, and afterwards a small farmer. He had joined a sect of seceders from the kirk, and had all the characteristics of the typical Scottish Calvinist. He was respected for his integrity and independence, and a stern outside covered warm affections. The family tie between all the Carlyles was unusually strong, and Thomas regarded his father with a reverence which found forcible expression in his Reminiscences. He always showed the tenderest love for his mother, and was the best of brothers. The narrow means of his parents were made sufficient by strict frugality. He was sent to the parish school when seven, and to Annan grammar-school when ten years old. His pugnacity brought him into troubles with his fellows at both schools; but he soon gave up the appetite for learning which induced his father to educate him for the ministry. He walked to Edinburgh in November 1809, and entered the university. He cared little for any of the professors, except Sir John Leslie, from whom he learned some mathematics. He acquired a little classical knowledge, but the most valuable influence was that of his contemporaries. A few lads in positions similar to his own began to look up to him as an intellectual leader, and their correspondence with him shows remarkable interest in literary matters. In 1814 Carlyle, still looking forward to the career of a minister, obtained the mathematical mastership at Annan. The salary of £60 or £70 a year enabled him to save a little money. He went to Edinburgh once or twice, to deliver the discourses required from students of divinity. He does not seem, however, to have taken to his profession very earnestly. He was too shy and proud to see many of the Annan people, and found his chief solace in reading such books as he could get. In 1816 he was appointed, through the recommendation of Leslie, to a school at Kirkcaldy, where Edward Irving, Carlyle's senior by three years, was also master. Irving's severity as a teacher had offended some of the parents, when Carlyle, like his rival, the next year, took his place. A previous meeting with Irving, also a native of Annan, had led to a little passage of arms, but Irving now welcomed Carlyle with a generosity which entirely won his heart, and the rivals soon became the closest of friends. The intimacy, affectionately commemorated in the Reminiscences, was of great importance to Carlyle's whole career. "But for Irving," he says, "I had never known what the communion of man with man means." Irving had a library, in which Carlyle devoured Gibbon and much French literature, and they made various excursions
CARLYLE, THOMAS

350
together. Carlyle did his duties as a schoolmaster punctiliously, but found the life thoroughly ungenial. No man was less fitted by temperament for the necessary drudgery and worry. A passing admiration for a Miss Gordon is supposed to have suggested the "Blumine" of Sartor Resartus; but he made no new friendships, and when Irving left at the end of 1818 Carlyle also resigned his post.

He had by this time resolved to give up the ministry. He has given no details of the intellectual change which alienated him from the church. He had, however, been led, by whatever process, to abandon the dogmatic system of his forefathers, though he was and always remained in profound sympathy with the spirit of their teaching. A period of severe struggle followed. He studied law for a time, but liked it no better than schoolmastering. He took a pupil or two, and wrote articles for the Edinburgh Encyclopaedia under the editorship of Brewster. He occasionally visited his family, and their unconfiding failure helped to keep up his courage. Meanwhile he was going through a spiritual crisis. Atheism seemed for a time to be the only alternative to his old creed. It was, however, profoundly repugnant to him. At last, one day in June 1821, after three weeks' total sleeplessness, he went through the crisis afterwards described quite "literally" in Sartor Resartus. He cast out the spirit of negation, and henceforth the temper of his misery was changed to one, not of "whining," but of "indignation and grim fire-eyed defiance." That, he says, was his spiritual new-birth, though certainly not into a life of serenity. The conversion was coincident with Carlyle's submission to a new and very potent influence. In 1819 he had begun to study German, with which he soon acquired a very remarkable facility. Many of his contemporaries were awakening to the importance of German thought, and Carlyle's knowledge enabled him before long to take a conspicuous part in diffusing the new intellectual light. The chief object of his reverence was Goethe.

In many important respects no two men could be more unlike; but, for the present, Carlyle seems to have seen in Goethe a proof that it was possible to reject worn-out dogmas without sinking into materialism. Goethe, by singularly different methods, had emerged from a merely negative position into a lofty and coherent conception of the universe. Meanwhile, Carlyle's various anxieties were beginning to be complicated by physical derangement. A rat, he declared, was gnawing at the pit of his stomach. He was already suffering from the ailments, whatever their precise nature, from which he never escaped. He gave vent to his irritability by lamentations so grotesquely exaggerated as to make it difficult to estimate the real extent of the evil.

Irving's friendship now became serviceable. Carlyle's confession of the radical difference of religious opinion had not alienated his friend, who was settling in London, and used his opportunities for promoting Carlyle's interest. In January 1822 Carlyle, through Irving's recommendation, became tutor to Charles and Arthur Buller, who were to be students at Edinburgh. Carlyle's salary was £1000 a year, and this, with the proceeds of his literary work, enabled him at once to help his brother John to study medicine and his brother Alexander to take up a farm. Carlyle spent some time with the elder Bullers, but found a life of dependence upon fashionable people humiliating and unsatisfactory. He employed himself at intervals upon a life of Schiller and a translation of Wilhelm Meister. He received £200 for a translation of Legendre's Geometry; and an introduction, explaining the theory of proportion, is said by De Morgan to show that he could have gained distinction as an expositor of mathematical principles. He finally gave up his tutorship in July 1824, and for a time tried to find employment in London. The impressions made upon him by London men of letters were most unfavourable. Carlyle felt by this time conscious of having a message to deliver to mankind, and his comrades, he thought, were making literature a trade instead of a vocation, and prostituting their talents to frivolous journalism. He went once to see Coleridge, who was then delivering his oracular utterances at Highgate, and the only result was the

singly vivid portrait given in a famous chapter in his life of Sterling. Coleridge seemed to him to be ineffectual as a philosopher, and personally to be a melancholy instance of genius running to waste. Carlyle, conscious of great abilities, and impressed by such instances of the deleterious effects of the social atmosphere of London, resolved to settle in his native district. There he could live frugally and achieve some real work. He could, for one thing, be the interpreter of Germany to England. A friendly letter from Goethe, acknowledging the translation of Wilhelm Meister, reached him at the end of 1824 and greatly encouraged him. Goethe afterwards spoke warmly of the life of Schiller, and desired it to be translated into German. Letters occasionally passed between them in later years, which were edited by Professor Charles Eliot Norton in 1887. Goethe received Carlyle's homage with kind complacency. The gift of a seal to Goethe on his birthday in 1831 "from fifteen English friends," including Scott and Wordsworth, was suggested and carried out by Carlyle. The interest in German, which Carlyle did so much to promote, suggested to him other translations and reviews during the next few years, and he made some preparations for a history of German literature. British curiosity, however, about such matters seems to have been soon satisfied, and the demand for such work slackened.

Carlyle was meanwhile passing through the most important crisis of his personal history. Jane Baillie Welsh, born 1801, was the only child of Dr Welsh of Haddington. She had shown precocious talent, and was sent to the school at Haddington where Edward Irving (q.v.) was a master. After her father's death in 1819 she lived with her mother, and her wit and beauty attracted many admirers. Her old tutor, Irving, was now at Kirkcaldy, where he became engaged to a Miss Martin. He visited Haddington occasionally in the following years, and a strong mutual regard arose between him and Miss Welsh. They contemplated a marriage, and Irving endeavoured to obtain a release from his previous engagement. The Martin family held him to his word, and he took a final leave of Miss Welsh in 1822. Meanwhile he had brought Carlyle from Edinburgh and introduced him to the Welshes. Carlyle was interested by the brilliant abilities of the young lady, procured books for her and wrote letters to her as an intellectual guide. The two were to perform a new variation upon the theme of Abelard and Héloïse. [A good deal of uncertainty long covered the precise character of their relations. Until 1909, when Mr. Alexander Carlyle published his edition of the "love-letters," the full material was not accessible; they had been read by Carlyle's biographer, Froude, and also by Professor Charles Norton, and Norton (in his edition of Carlyle's Early Letters, 1886) declared that Froude had distorted the significance of this correspondence in a sense injurious to the writers. The publication of the letters certainly seems to justify Norton's view.] Miss Welsh's previous affair with Irving had far less importance than Froude ascribes to it; and she soon came to regard her past love as a childish fancy. She recognized that she was intellectually inferior, that she was incapable of deepening into genuine love. The process, however, took some time. Her father had bequeathed to her his whole property (£200 to £300 a year). In 1823 she made it over to her mother, but left the whole to Carlyle in the event of her own and her mother's death. She still declared that she did not love him well enough to become his wife. In 1824 she gradually relented so far as to say that she would marry if he could achieve independence. She had been brought up in a station superior to that of the Carlyles, and could not accept the life of hardship which would be necessary in his present circumstances. Carlyle, accustomed to his father's household, was less frightened by the prospect of poverty. He was determined not to abandon his vocation as a man of genius by following the lower though more profitable paths to literary success, and expected that his wife should partake the necessary sacrifice of comfort. The natural result of such discussions followed. The attraction became stronger on both sides, in spite of occasional spasms of doubt.
An odd incident precipitated the result. A friend of Irving’s, Mrs Basil Montague, wrote to Miss Welsh, to exert her to support him in pressing his suit for Irving, who had married Miss Martin in 1823. Miss Welsh replied by announcing her intention to marry Carlyle; and then told him the whole story, of which he had previously been ignorant. He properly begged her not to yield to the impulse without due consideration. She answered by coming at once to his father’s house, where he was staying; and the marriage was finally settled. It took place on the 17th of October 1826.

Carlyle had now to arrange the mode of life which should enable him to fulfil his aspiration. His wife had made over her income to her mother, but he had saved a small sum upon which to begin housekeeping. A passing suggestion from Mrs Carlyle that they might live with her mother was judiciously abandoned. Carlyle had thought of occupying Cranigputtock, a remote and dreary farm belonging to Mrs Welsh. His wife objected his utter incapacity as a farmer; and they finally took a small house at Comely Bank, Edinburgh, where they could live on a humble scale. The brilliant conversation of both attracted some notice in the literary society of Edinburgh. The most important connexion was with Francis, Lord Jeffrey, still editor of the Edinburgh Review. Though Jeffrey had no intellectual sympathy with Carlyle, he accepted some articles for the Review and became warmly attached to Mrs Carlyle. Carlyle began to be known as leader of a new “mystic” school, and his earnings enabled him to send his brother John to study in Germany. The public appetite, however, for “mysticism” was not keen. In spite of support from Jeffrey and other friends, Carlyle failed in a candidature for a professorship at St Andrews. His brother, Alexander, had now taken the farm at Cranigputtock, and the Carlyles decided to settle at the separate dwelling-house there, which would bring them nearer to Mrs Welsh. They went there in 1828, and began a hard struggle. Carlyle, indomitably determined to make no concessions for immediate profit, wrote slowly and carefully, and turned out some of his most finished work. He laboured “passionately” at Sartor Resartus, and made articles out of fragments originally intended for the history of German literature. The money difficulty soon became more pressing. John, whom he was still helping, was trying unsuccessfully to set up as a doctor in London; and Alexander’s farming failed. In spite of such drawbacks, Carlyle in later years looked back upon the life at Cranigputtock as on the whole a comparatively healthy and even happy period, as it was certainly one of most strenuous and courageous endeavour. Though often absorbed in his work and made both gloomy and irritable by his anxieties, he found relief in rides with his wife, and occasionally visiting their relations. Their letters during temporary separations are most affectionate. The bleak climate, however, the solitude, and the necessity of managing a household with a single servant, were excessively trying to a delicate woman, though Mrs Carlyle concealed from her husband the extent of her sacrifices. The position was gradually becoming untenable. In the autumn of 1831 Carlyle was forced to accept a loan of £50 from Jeffrey, and went in search of some means of contributing higher with his work. He made some engagements with publishers; though no one would take Sartor Resartus, and returned to Cranigputtock in the spring of 1832. Jeffrey, stimulated perhaps by his sympathy for Mrs Carlyle, was characteristically generous. Besides pressing loans upon both Thomas and John Carlyle, he offered to settle an annuity of £200 upon Thomas, and finally enabled John to support himself by recommending him to a medical position.1 Carlyle’s proud spirit of independence made him reject Jeffrey’s help as long as possible; and even his acknowledgment of the generosity (in the Reminiscences) is tinged with something disagreeably like resentment. In 1834 he applied to Jeffrey for a post at the Edinburgh Observatory.

1 John Aitken Carlyle (1801-1879) finally settled near the Carlyles in Chelsea. He began an English prose version of Dante’s Divine Comedy—which has earned him the name of “Dante Carlyle”—but only completed the translation of the Inferno (1849). The work included a critical edition of the text and a valuable introduction and notes.

Jeffrey naturally declined to appoint a man who, in spite of some mathematical knowledge, had no special qualification, and administered a general lecture upon Carlyle’s arrogance and eccentricity which left a permanent sense of injury.

In the beginning of 1833 the Carlyles made another trial of Edinburgh. There Carlyle found materials in the Advocates’ Library for the article on the Diamond Necklace, one of his most perfect writings, which led him to study the history of the French Revolution. Sartor Resartus was at last appearing in Fraser’s Magazine, though the rate of payment was cut down, and the publisher reported that it was received with “unqualified dissatisfaction.” Edinburgh society did not attract him, and he retreated once more to Cranigputtock. After another winter the necessity of some change became obvious. The Carlyles resolved to “burn their ships.” They went to London in the summer of 1834, and took a house at 5 (now 24) Cheyne Row, Chelsea, which Carlyle inhabited till his death; the house has since been bought for the public. Irving, who had welcomed him on former occasions, was just dying,—a victim, as Carlyle thought, to fashionable cajoleries. A few young men were beginning to show appreciation. J. S. Mill had made Carlyle’s acquaintance in the previous visit to London, and had corresponded with him. Mill had introduced Ralph Waldo Emerson, who visited Cranigputtock in 1833. Carlyle was charmed with Emerson, and their letters published by Professor Norton show that his regard never cooled. Emerson’s interest showed that Carlyle’s fame was already spreading in America. Carlyle’s connexion with Charles Buller, a zealous utilitarian, introduced him to the circle of “philosophical radicals.”

Carlyle called himself in some sense a radical; and J. S. Mill, though not an intellectual disciple, was very warm admirer of his friend’s genius. Carlyle had some expectation of the editorship of the London Review, started by Sir W. Molesworth at this time as an organ of philosophical radicalism. The combination would clearly have been explosive. Meanwhile Mill, who had collected many books upon the French Revolution, was eager to help Carlyle in the history which he was now beginning. He set to work on one hand to finish the first volume in five months. The manuscript, while entrusted to Mill for annotation, was burnt by an accident. Mill induced Carlyle to accept in compensation £100, which was urgently needed. Carlyle took up the task again and finished the whole on the 12th of January 1837. “I can tell the world,” he said to his wife, “you have not had for a hundred years any book that comes more direct and flamboyantly from the heart of a living man. Do what you like with it, you——”

The publication, six months later, of the French Revolution marks the turning-point of Carlyle’s career. Many readers hold it to be the best, as it is certainly the most characteristic, of Carlyle’s books. The failure of Sartor Resartus to attract average readers is quite intelligible. It contains, indeed, some of the most impressive expositions of his philosophical position, and some of his most beautiful and perfectly written passages. But there is something forced and clumsy, in spite of the flashes of grim humour, in the machinery of the Clothes Philosophy. The mannerism, which has been attributed to an imitation of Jean Paul, appeared to Carlyle himself to be derived rather from the phrases current in his father’s house, and in any case gave an appropriate dialect for the expression of his peculiar idiosyncrasy. But it could not be appreciated by readers who would not take the trouble to learn a new language. In the French Revolution Carlyle had discovered his real strength. He was always at his best when his imagination was set to work upon a solid framework of fact. The book shows a unique combination: on the one hand is the singularly shrewd insight into character and the vivid realization of the picturesque; on the other is the “mysticism” or poetical philosophy which relieves the events against a background of mystery. The contrast is marked by the humour which seems to combine a cynical view of human folly with a deeply pathetic sense of the sadness and suffering of life. The convictions, whatever their value, came, as he said, “flamboyantly from the heart.” It was, of course, impossible for Carlyle to satisfy modern requirements of matter-of-fact accuracy.

CARLYLE, THOMAS
He could not in the time have assimilated all the materials even then extant, and later accumulations would necessitate a complete revision. Considered as a "prose epic," or a vivid utterance of the thought of the period, it has a permanent and unique value.

The book was speedily successful. It was reviewed by Mill in the Westminster and by Thackeray in The Times, and Carlyle, after a heroic struggle, was at last touching land. In each of the years 1837 to 1840 he gave a course of lectures, of which the last only (upon "Hero Worship") was published; they materially helped his finances. By Emerson's management he also received something during the same period from American publishers. At the age of forty-five he had thus become independent. He had also established a position among the chief writers of the day. Young disciples, among whom John Sterling was the most accepted, were gathering round him, and he became an object of social curiosity. Monckton Milnes (Lord Houghton), who won universal popularity by the most munificent kindliness of nature, became a cordial friend. Another important intimacy was with the Barings, afterwards Lord and Lady Ashburne. Carlyle's conversational powers were extraordinary; though, as he won greater recognition as a prophet, he indulged too freely in didactic monologue. In his prophetic capacity he published two remarkable books: Chartism (1839), enlarged from an article which Lockhart, though personally approving, was afraid to take for the Quarterly; and Past and Present (1843), in which the recently published Mediæval Chronicle was taken as a text for the exposure of modern evils. They may be regarded as expositions of the doctrine implicitly set forth in the French Revolution. Carlyle was a "radical" as sharing the sentiments of the class in which he was born. He had been profoundly moved by the widely-spread distresses in his earlier years. When the yeomanry were called out to suppress riots after the Peace, his sympathies were with the people rather than with the authorities. So far he was in harmony with Mill and the "philosophical radicals." A fundamental divergence of principle, however, existed and was soon indicated by his speedy separation from the party and alienation from Mill himself. The Revolution, according to him, meant the sweeping away of effete beliefs and institutions, but implied also the necessity of a reconstructive process. Chartism begins with a fierce attack upon the laissez faire theory, which showed blindness to this necessity. The prevalent political economy, in which that theory was embodied, made a principle of neglecting the very evils which it should be the great function of government to remedy. Carlyle's doctrines, entirely opposed to the ordinary opinions of Whigs and Radicals, found afterwards an expositor in his ardent disciple Ruskin, and have obvious affinities with more recent socialism. At the time he was as one crying in the wilderness to little practical purpose. Liberals were scandalized by his apparent identification of "right" with "might," implied in the demand for a strong government; and though he often declared the true interpretation to be that the right would ultimately become might, his desire for strong government seemed too often to sanction the inverse view. He came into collision with philanthropists, and was supposed to approve of despotism for its own sake.

His religious position was equally unintelligible to the average mind. While unequivocally rejecting the accepted creeds, and so scandalizing even liberal theologians, he was still more hostile to simply sceptical and materialist tendencies. He was, as he called himself, a "mystic"; and his creed was too vague to be put into any formula beyond a condemnation of atheism. One corollary was the famous doctrine of "hero worship" first expounded in his lectures. Any philosophy of history which emphasized the importance of general causes seemed to him to sturdy a simply mechanical doctrine and to deny the efficacy of the great spiritual forces. He met it by making biography the essence of history, or attributing all great events to the "heroes," who are the successive embodiments of divine revelations. This belief was implied in his next great work, Life and Letters of Oliver Cromwell, published in 1845. The great Puritan hero was a man after his own heart, and the portrait drawn by so sympathetic a writer is not only intensely vivid, but a very effective rehabilitation of misrepresented character. The "biographical" view of history, however, implies the weakness, not only of unqualified approval of all Cromwell's actions, but of omitting any attempt to estimate the Protector's real relation to the social and political development of the time. The question, what was Cromwell's real and permanent achievement, is not answered nor distinctly considered. The effect may be partly due to the peculiar form of the book as a detached series of documents and comments. The composition introduced Carlyle to the "Dryasdust" rubbish heaps of which he here and ever afterwards bitterly complained. A conscientious desire to unearth the facts, and the effect of extracting from the dustel records the materials for graphic pictures, made the process of production excessively painful. For some years after Cromwell Carlyle wrote little. His growing acceptance by publishers, and the inheritance of his property by Mrs Carlyle on her mother's death in 1842, finally removed the stimulus of money pressure. He visited Ireland in 1846 and again in 1849, when he made a long tour in company with Sir C. Gavan Duffy, then a young member of the Nationalist party (see Sir C. G. Duffy's Conversations with Carlyle, 1892, for an interesting narrative). Carlyle's strong convictions as to the misery and misgovernment of Ireland recommended him to men who had taken part in the rising of 1848. Although the remedies acceptable to a eulogist of Cromwell could not be to their taste, they admired his moral teaching; and he received their attentions, as Sir C. G. Duffy testifies, with conspicuous courtesy. His aversion from the ordinary radicalism led to an article upon slavery in 1849, to which Mill replied, and which caused their final alienation. It was followed in 1850 by the Latterday Pamphlets, containing "sulphurous" denunciations of the do-nothing principle. They gave general offence, and the diatribe, according to Froude, stopped the sale for years. The Life of Sterling (d. 1844), which appeared in 1851, was intended to correct the life by Julius Hare, which had given too much prominence to theological questions. The subject roused Carlyle's tenderest mood, and the Life is one of the most perfect in the language.

Carlyle meanwhile was suffering domestic troubles, unfortunately not exceptional in their nature, though the exceptional intellect and characters of the persons concerned have given them unusual prominence. Carlyle's constitutional irritability made him intensely sensitive to petty annoyances. He suffered the torments of dyspepsia; he was often sleepless, and the crowing of "demon-fowls" in neighbours' yards drove him wild. Composition meant for him intense absorption in his work; solitude and quiet were essential; and he resented interruptions by grotesque explosions of humorously exaggerated wrath. Mrs Carlyle had to pass many hours alone, and the management of the household and of devices intended to shield him from annoyances was left entirely to her. House-cleanings and struggles with builders during the construction of a "sound-proof room" taxed her energy, while Carlyle was hiding himself with his family in Scotland or staying at English country houses. Nothing could be more affectionate than his behaviour to his wife on serious occasions, such as the death of her mother, and he could be considered when his attention was called to the facts. But he was often oblivious to the strain upon her energies, and had little command of his temper. An unfortunate aggravation of the difficulty arose from his intimacy with the Ashburtons. Lady Ashburnon, a woman of singular social charm and great ability, appreciated the author, but apparently accepted the company of the author's wife rather as a necessity than as an additional charm. Mrs Carlyle was hurt by the fine dependence which her husband's accessibility to aristocratic blandishments. Carlyle, as a wise man, should have yielded to his wife's wishes; unluckily, he was content to point out that her jealousy was unreasonable, and, upon that very insufficient ground, to disregard it and to continue his intimacy with the Ashburtons on the old terms. Mrs Carlyle bittered his conduct. She had been willing to renounce any aspirations of her own and to sink herself in his glory, but she
naturally expected him to recognize her devotion and to value her society beyond all others. She had just cause of complaint, and a remarkable power, as her letters prove, of seeing things plainly and despising sentimental consolations. She was childless, and had time to brood over her wrongs. She formed a little circle of friends, attached to her rather than to her husband; and to one of them, Giuseppe Mazzini, she confided her troubles in 1846. He gave her admirable advice; and the alienation from her husband, though it continued still to smoulder, led to no further results. A journal written at the same time gives a painful record of her sufferings, and after her death made Carlyle conscious for the first time of their full extent. The death of Lady Ashburton in 1857 removed this cause of jealousy; and Lord Ashburton married a second wife in 1858, who became a warm friend of both Carlyles. The cloud which had separated them was thus at last dispersed. Meanwhile Carlyle had become absorbed in his best and most laborious work. Soon after the completion of the Cromwell he had thought of Frederick for his next hero, and in 1845 contemplated a visit to Germany to collect materials. He did not, however, settle down finally to the work till 1852. He shut himself up in his study to wrestle with the Prussian Dryasdusts, whom he discovered to be as wearisome as their Puritan predecessors and more voluminous. He went to Scotland to see his mother, to whom he had always shown the tenderest affection, on her deathbed at the end of 1853. He returned to shut himself up in the “sound-proof room.” He twice visited Germany (1852 and 1858) to see Frederick’s battlefields and obtain materials; and he occasionally went to the Ashburtons and his relations in Scotland. The first two volumes of Frederick the Great appeared in 1858, and succeeding volumes in 1862, 1864 and 1865. The success was great from the first, though it did little to clear up Carlyle’s gloom. The book is in some respects his masterpiece, and its merits are beyond question. Carlyle had spared no pains in research. The descriptions of the campaigns are admirably vivid, and show his singular eye for scenery. Carlyle’s narratives are said to be used by military students in Germany, and at least convince the non-military student that he can understand the story. The book was declared by Emerson to be the wittiest ever written. Many episodes, describing the society at the Prussian court and the relations of Frederick to Voltaire, are unsurpassable as humorous portraiture. The effort to fuse the masses of raw material into a well-proportioned whole is perhaps not quite successful; and Carlyle had not the full sympathy with Frederick which had given interest to the Cromwell. A hero-worshipper with half-concealed doubts as to his hero is in an awkward position. Carlyle’s general conception of history made him comparatively blind to aspects of the subject which would, to writers of other schools, have a great importance. The extraordinary power of the book is undeniable, though it does not show the fire which animated the French Revolution. A certain depression and weariness of spirit darken the general tone.

During the last labours Mrs Carlyle’s health had been breaking. The study now that happier relations had been restored, did his best to give her the needed comforts; and in spite of his immersion in Frederick, showed her all possible attention in later years. She had apparently recovered from an almost hopeless illness, when at the end of 1865 he was elected to the rectoryship of the university of Edinburgh. He delivered an address there on the 2nd of April 1866, unusually mild in tone, and received with general applause. He was still detained in Scotland when Mrs Carlyle died suddenly while driving in her carriage. The immediate cause was the shock of an accident to her dog. She had once hurt her mother’s feelings by refusing to use some wax candles. She had preserved them ever since, and by her direction they were now lighted in the chamber of death. Carlyle was overpowered by her loss. His life thenceforward became more and more secluded, and he gradually became incapable of work. He went to Mentone in the winter of 1866 and began the Reminiscences. He afterwards annotated the letters from his wife, published (1883) as Letters and Memorials. He was, as Froude says, impressed by the story of Johnson’s “penance” at Uttoxeter, and desired to make a posthumous confession of his shortcomings in his relations to his wife. A few later utterances made known his opinions of current affairs. He joined the committee for the defence of Governor Eyre in 1867; he also wrote in 1867 an article upon “shooting Niagara,” that is, upon the tendency of the Reform Bill of that year; and in 1870 he wrote a letter defending the German case against France. The worth of his Frederick was acknowledged by the Prussian Order of Merit in 1874. In the same year Disraeli offered him the Grand Cross of the Bath and a pension. He declined very courteously, and felt some regret for previous remarks upon the minister. The length of his literary career was now softening old antipathies and he was the object of general respect. His infirmities enforced a very retired life, but he was constantly visited by Froude, and occasionally by his disciple Ruskin. A small number of other friends paid him constant attention. His conversation was still interesting, especially when it turned upon his recollections, and though his judgments were sometimes severe enough, he never condescended to the scandalous. His views of the future were gloomy. The world seemed to be going from bad to worse, with little heed to his warnings. He would sometimes regret that it was no longer permissible to leave it in the old Roman fashion. He sank gradually, and died on the 4th of February 1881. A place in Westminster Abbey was offered, but he was buried, according to his own desire, by the side of his parents at Ecclefechan. He left Craigenputtock, which had become his own property, to found bursaries at the university of Edinburgh. He gave his books to Harvard College.

Carlyle’s appearance has been made familiar by many portraits, none of them, according to Froude, satisfactory. The statue by Boehm on the Chelsea Embankment, however, is characteristic; and there is a fine painting by Watts in the National Portrait Gallery. J. McNiel Whistler’s portrait of him is in the possession of the Glasgow corporation.

During the last years the antagonism roused by his attacks upon popular opinions had subsided; and upon his death general expression was given to the emotions natural upon the loss of a remarkable man of genius. The rapid publication of the Reminiscences by Froude produced a sudden revulsion of feeling. Carlyle became the object of general condemnation. Froude’s biography, and the Memorials of Mrs Carlyle, published soon afterwards, strengthened the hostile feeling. Carlyle had appended to the Reminiscences an injunction to his friends not to publish them as they stood, and added that no part could ever be published without the strictest editing. Afterwards, when he had almost forgotten what he had written, he verbally empowered Froude to use his own judgment: Froude accordingly published the book at once, without any editing, and with many inaccuracies. Omissions of a few passages written from memory at a time of profound nervous depression would have altered the whole character of the work. Froude, in this and the later editing, disclaimed that he was giving effect to Carlyle’s wish to imitate Johnson’s “penance.” No one, said Boswell, should persuade him to make his lion into a cat. Froude intended, in the same spirit, to give the shades as well as the lights in the portrait of his hero. His admiration for Carlyle probably led him to assume too early that his readers would approach the story from the same point of view, that is, with an admiration too warm to be repelled by the admissions. Moreover, Froude’s characteristic desire for picturesque effect, unchecked by any painstaking accuracy, led to his reading preconceived impressions into his documents. The result was that Carlyle was too often judged by his defects, and regarded as a selfish and eccentric misanthrope with flashes of genius, rather than as a man with many of the highest qualities of mind and character clouded by constitutional infirmities. Yet it would be difficult to speak too strongly of the great qualities which underlay the superficial defects. Through long years of poverty and obscurity Carlyle showed unsurpassed fidelity to his vocation and superiority to the lower temptations which have ruined so many literary careers. His ambition might be interpreted as selfishness, but certainly...
showed no coldness of heart. His untinted generosity to his brothers during his worst times is only one proof of the singular strength of his family affections. No one was more devoted to such congenial friends as Irving and Sterling. He is not the only man whom absorption in work and infirmity of temper have made into a provoking husband, though few wives have had Mrs Carlyle's capacity for expressing the sense of injustice. The knowledge that the deepest devotion underlies misunderstandings is often a very imperfect consolation; but such devotion clearly existed all through, and proves the defect to have been relatively superficial.

The harsh judgments of individuals in the *Reminiscences* had no parallel in his own writings. He scarcely ever mentions a contemporary, and was never involved in a personal controversy. But the harshness certainly reflects a characteristic attitude of mind. Carlyle was throughout a pessimist or a prophet denouncing abacksiding world. His most popular contemporaries seemed to him to be false guides, and charlatans had oysted the heroes. The general condemnation of "shams" and cant had, of course, particular applications, though he left them to be inferred by his readers. Carlyle was the exponent of many of the defects of his time, and by his later works he sought sympathy with aspirations for a spiritual religion and for a lofty idealism in political and social life. To most minds, however, which cherish such aspirations the gentler optimism of men like Emerson was more congenial. They believed in the progress of the race and the triumph of the nobler elements. Though Carlyle, especially in his earlier years, could deliver an invigorating and encouraging, if not a sanguine doctrine, his utterances were more generally couched in the key of denunciation, and betrayed a growing despondency. Materialism and low moral principles seemed to him to be gaining the upper hand; and the hope that religion might survive the "old clothes" in which it had been draped seemed to grow fainter. The ordinary mind complained that he had no specific remedy to propose for the growing evils of the time; and the more cultivated idealist was alienated from the gloop and the tendency to despair. To a later generation it will probably appear that, whatever the exaggerations and the misconceptions to which he was led, his vehement attacks at least called attention to rather grave limitations and defects in the current discipline of society and ideals of the time. The mannerisms and grotesque exaggerations of his writings annoyed persons of refinement, and suggest Matthew Arnold's advice to flee "Carlylese" as you would flee the devil. Yet the shrewd common-sense, the biting humour, the power of graphic description and the imaginative "mysticism" give them a unique attraction for many even who do not fully sympathise with the implied philosophy or with the Puritanical code of ethics. The letters and autobiographical writings, whether they attract or repel sympathy, are at least a series of documents of profound interest for any one who cares to study character, and display an almost unique idiosyncrasy.

The chief authorities for Carlyle's life are his own *Reminiscences*, the Letters of Jane Welsh Carlyle, the *Love Letters of Thomas Carlyle and Jane Welsh* (ed. A. Carlyle), the first four volumes of his biographer Froude's *Carlyle*, Carlyle's literary executor. Prof. C. E. Norton's edition of the *Reminiscences* and his collection of Carlyle's Early Letters correct some of Froude's inaccuracies. A list of many articles upon Carlyle is given by Mr Ireland in *Notes and Queries*, June 1907, and in *Nineteenth Century*, and by other authors may be noticed Henry James, sen., in *Literary Remains*; Prof. Masson, Carlyle, Personally and in his Writings; Conway, Thomas Carlyle; Larkin, The Open Secret of Carlyle's Life; Mrs Oliphant in *Macmillan's Magazine* and *Fortnightly Review* for May 1883 and November 1884. A good deal of controversy has arisen relating to Froude's treatment of the relations between Carlyle and his wife, and during 1903-1904 this was pushed to a point of extreme curiosity. The question was not into the question of Carlyle's marital capacity, and the issues between Froude's assailants and his defenders, may consult *New Letters and Memorials of Jane Welsh Carlyle*, with introduction by Sir James Crichton-Browne, published by A. Crichton-Browne, and *The Nemesis of Froude*, by Sir J. Crichton-Browne and Alexander Carlyle; and articles in the *Contemporary Review* (June, July, August, 1903), and *Nineteenth Century* and *After* (May, July, 1903). See also Herbert Paul's *Life of Froude* (1905).

The precise truth in these matters is hardly recoverable, even if it concerns posterity; and though Froude was often inaccurate, he was given full authority by Carlyle, he had all the unpublished material before him, and he was dead and unable to reply to criticism when the later attacks were made.

**CARMAGNOLA, FRANCESCO BUSSONE, Count of (1590-1592). Italian soldier of fortune, was born at Carmagnola near Turin, and began his military career when twelve years old under Facino Cane, a condottiere who was then in the service of Gian Galeazzo Visconti, duke of Milan. On the death of the latter, in 1386, the duky was divided among his captains, but his son and heir, Filippo Maria, determined to reconquer it by force of arms. Facino Cane being dead, Visconti applied to Carmagnola, then in his thirtieth year, and gavc him command of the army. That general's success was astonishingly rapid, and soon the whole duky was brought once more under Visconti's sway. But Filippo Maria, although he rewarded Carmagnola generously, feared that he might become a danger to himself, and instead of giving him further military commands made him governor of Genoa. Carmagnola felt greatly aggrieved, and failing to obtain a personal interview with the duke, threw up his commission and offered his services to the Venetians (1475). He was well received in Venice, for the republic was beginning to fear the ambitions of the Visconti, and the new doge, Francesco Foscari, was anxious to join the Florentines and go to war with Milan. Carmagnola himself represented the duke's forces as much less numerous than they were supposed to be, and said that the Venetians would be an opportune one to attack him. These arguments, combined with the doge's warlike temper, proved fatal; Carmagnola was made captain-general of St Mark in 1476, and war was declared. But while the republic was desirous of rapid and conclusive operations, it was to the interest of Carmagnola, as indeed to all other soldiers of fortune, to make the operations last as long as possible, to avoid decisive operations, and to liberate all prisoners quickly. Consequently the campaign dragged on interminably, some battles were won and others lost, truces and peace treaties were made only to be broken, and no definite result was achieved. Carmagnola's most important success was the battle of Maciol (1477), but he did not follow it up. The republic, impatient of his dilatoriness, raised his remonstrances and promised him immense fees including the lordship of Milan, so as to increase his ardour, but in vain. At the same time Carmagnola was perpetually receiving messengers from Visconti, who offered him great rewards if he would abandon the Venetians. The general trifled with his past as with his present employers, believing in his foolish vanity that he held the fate of both in his hand. But the Venetians were dangerous and formidable enough to trifle with them. After years of fruitless patience, the Council of Ten determined to bring him to justice. Summoned to Venice to discuss future operations on the 29th of March, 1433, he came without suspicion. On his arrival at the ducal palace he was seized, imprisoned and brought to trial for treason against the republic. Although the doge befriended him he was condemned to death and beheaded on the 5th of May. A man of third-rate ability, his great mistake was that he failed to see that he could not do with a solvent and strong government what he could with bankrupt tyrants without military resources, and that the astute Visconti meant to ruin him for his abandonment.

**BIBLIOGRAPHY.**—The best account of Carmagnola is Horatio Brown's essay in his *Studies in Venetian History* (London, 1897); see also A. Battistella, *Il Conte di Carmagnola* (Genoa, 1889); E. Ricciti, *Storia delle Compagnie di Ventura* (Turin, 1845); and Alessandro Manzoni (q.v.) made this episode the subject of a poetical drama, *Il Conte di Carmagnola* (1826).

**CARMAGNOLA, a town in Italy, of the province of Turin, 18 m. by rail S. of Turin. Pop. (1901) 2447 (town), 11,721 (commune). It is the junction where the lines for Savona and Cuneo diverge; it is also connected with Turin by a steam tramway via Carignano. Carmagnola is a place of medieval origin. The town was captured by the French in 1706.

**CARMAGNOLE** (from the Carmagnola, the town in Italy), a word first applied to a Piedmontese peasant costume, well known in the south of France, and brought to Paris by the revolutionaries.
of Marseilles in 1798. It consisted of a short skirted coat with rows of metal buttons, a tricoloured waistcoat and red cap, and became the popular dress of the Jacobins. The name was then given to the famous revolutionary song, composed in 1792, the tune of which, and the wild dance which accompanied it, may have also been brought into France by the Piedmontese. The original first verse began—

"Monsieur Veto (i.e. Louis XVI.) avait promis
D'être fidèle à sa patrie."

and each verse ends with the refrain—

"Vive le son, vive le son,
Dumons la Carmagnole,
Vive le son
Du Canon."

The words were constantly altered and added during the Terror and later; thus the well-known lines,

"Madame Veto avait promis
De faire égorger tout Paris
On lui coupa la tête," &c.,

were added after the execution of Marie Antoinette. Played in double time the tune was a favourite march in the Revolutionary armies, until it was forbidden by Napoleon, on becoming First Consul.

CARMARTHEN (Caerfyrddin), a municipal borough, contributory parliamentary borough (united with Llanelli since 1832), and county town of Carmarthenshire, and a county of itself, finely situated on the right bank of the Towy, which is here tidal and navigable for small craft. Pop. (1901) 10,025. It is the terminal station of a branch of the London & North-Western railway coming southward from Shrewsbury, and is a station on the main line of the Great Western running to Fishguard; it is also the terminus of a branch-line of the Great Western running to Newcastle-Emlyn. The station buildings lie on the left bank of the river, which is here spanned by a fine old stone bridge. There are works for the manufacture of woollens and ropes, also tanneries, but it is as the central market of a large and fertile district that Carmarthen is most important. The weekly Saturday market is well attended, and affords interesting scenes of modern Welsh agricultural life. From the convenient and accessible position of the town, the gosol and lunatic asylum serving for the three south-western counties of Wales—Cardigan, Pembroke and Carmarthen—have been fixed here. Although historically one of the most important towns in South Wales, Carmarthen can boast of very few ancient buildings, and the general aspect of the town is modern. A well-preserved gateway of red sandstone and portions of two towers of the castle are included in the buildings of the present gaol, and the old parish church of St Peter contains some interesting monuments, amongst them being the altar tomb (of the 16th century) of Sir Rhys ap Thomas, K.G., and his wife, which was removed hither for safety at the Reformation from the desecrated church of the neighbouring Priory of St John. Some vestiges of this celebrated monastic house, which formerly owned the famous Welsh MS. known as the "Black Book of Carmarthenshire," are visible between the present Priory Street and the river. Of the more recent erections in the town, mention may be made of the granite obelisk in memory of General Sir Thomas Picton (1758-1815) and the bronze statue of General Sir William Nott (1784-1846).

Carmarthen is commonly reputed to occupy the site of the Roman station of Maridunum, and its present name is popularly associated with the wizard-statesman Merlin, or Merddyn, whose memory and prophecies are well remembered in these parts of Wales and whose home is popularly believed to have been the conspicuous hill above Abergwili, known as Merlin's Hill. Another derivation of the name is to be found in Caer-môr-din, signifying "a fortified place near the sea." In any case, the antiquity of the town is undisputed, and it served as the seat of government for Ystrad Tywi until the year 877, when Prince Cadell of South Wales abandoned Carmarthen for Dinefawr, near Llandilo, probably on account of the maritime raids of the Danes and Saxons. Towards the close of the 11th century a castle was built here by the Normans, and for the next two hundred years town and castle were frequently taken and retaken by Welsh or English. On the annexation of Wales, Edward I. established here his courts of chancery and exchequer and the great sessions for South Wales. Edward III., by the Statute Staple of 1353, declared Carmarthen the sole staple for Wales, ordering that every bale of Welsh wool should be sealed or "cocked" here before it left the Principality. The earliest charter recorded was granted in 1201 under King John; a charter of James I. in 1604 constituted Carmarthen a county of itself; and under a charter by George III. in 1764, which had been specially petitioned for by the citizens, the two separate jurisdictions of Old and New Carmarthen were fused and henceforth "called by the name of Our Borough of Carmarthen." In 1555 Bishop Farrar of St David's was publicly burned for heresy under Queen Mary at the Market Cross, which was ruthlessly destroyed in 1846 to provide a site for General Nott's statue. In 1646 General Laughtar tox and demolished the castles in the lifetime of the parliament, and in 1649 Oliver Cromwell resided at Carmarthen on his way to Ireland. In 1684 the duke of Beaufort with a numerous train made his state entry into Carmarthen as lord-president of Wales and the Marches. With the rise of Llanelli the industrial importance of Carmarthen has tended to decline; but owing to its central position, its close connexion with the bishops of St David's and its historic past the town is still the chief focus of all social, political and ecclesiastical movements in the three counties of Cardigan, Pembroke and Carmarthen. Carmarthen was created a parliamentary borough in 1536.

CARMARTHENSIRE. (Sir Gaerfyrddin, colloquially known as Sir Gâr), a county of South Wales bounded N. by Cardigan, E. by Brecon and Glamorgan, W. by Pembroke and S. by Carmarthen Bay of the Bristol Channel. The modern county has an area of 918 sq. m., and is therefore the largest in size of the South Welsh counties. Almost the whole of its surface is hilly and irregular, though the coast-line is fringed with extensive stretches of marsh or sandy burrows. Much of the scenery in the county, particularly in the upper valley of the Towy, is exceedingly beautiful and varied. On its eastern borders adjoining Breconshire rises the imposing range of the Black Mountains (Mynydd Du), sometimes called the Carmarthenshire Beacons, where the Carmarthen Van attains an elevation of 2632 ft. Mynydd Mallaen in the wild districts of the north-east corner of the county is 1430 ft. in height, but otherwise few of the numberless rounded hills with which Carmarthenshire is thickly studded exceed 1000 ft. The principal river is the Towy (Tywi), which, with its chief tributaries, the Gwili, the Cothi and the Sawdew, drains the central part of the county and enters the Bay at Llanstephan, 9 m. below Carmarthen. Coracles are frequently to be observed on this river, as well as on the Teifi, which separates Carmarthenshire from Cardiganshire on the north. Other streams are the Tâf, which flows through the south-western portion of the county and reaches the sea at Llanybydder, the Gwendraeth, which is dammed at Kidwelly and the Loughor, or Llwchwr, which rises in the Black Mountains and forms for several miles the boundary between the counties of Carmarthen and Glamorgan until it falls into Carmarthen Bay at Loughor. All these rivers contain salmon, sewin (glossiad) and trout in fair numbers, and are consequently frequented by anglers. With the exception of the Van Pool in the Black Mountains the lakes of the county are inconsiderable in size.

Geology.—The oldest rocks in Carmarthenshire come to the surface in the Vale of Towy at Llanarthney and near Carmarthen; they consist of black shales of Tremadoc (Cambrian) age, and are succeeded by conglomerates, sandstones and shales, with beds of volcanic ash and mudstones of Arenigian (late Ordovician) age, which are seen to dip along a belt of intense folding and faulting which follows the Towy from Llangadock to Carmarthen and extends westwards to the edge of the country at Whitland. The Llandilo shales, flags and mudstones and occasional volcanics, which follow, are well developed at Llangadock and Llandilo and near Carmarthen, and are famed for their trilobites, Asaphus tyranus and Ozygia Buchi. Shales and mudstones and impersistent limestones of Balanage age come next in order, and, bounding the Vale of Towy on the north, extend as a
CARMARTHENSIRE

narrow belt north-westwards towards the Presley hills. Except for the foregoing deposits the great area between the Teyfi and the Towy, of which little is known, is made up of a monotonous succession of greatly folded slates and shales with interbedded conglomerates and sandstones which give rise to scarps, ridges and mountains; they appear to be of Llandovery age.

South of the Towy a narrow belt of steeply dipping and even inverted Silurian sandstones and mudstones (Upper Llandovery, Wenlock and Ludlow) extends south-westwards from Llandovery to Llandelli, where they disappear under the Old Red Sandstone. This formation, which consists of red marls and sandstones with occasional thin impure limestones (cornstones), extends from near Llandovery to beyond Carmarthen Bay; its upper conglomeratic breccias are interbedded with thick limestones of the Black Mountains. To the south the scarps and moorlands of the Carboniferous Limestone and Millstone Grit form the north-western rim of the South Wales coalfield. The rest of the county is occupied by the rich Coal-Measures of the Gwendraeth Valley and Llanelli districts. All the rocks in the county are affected by powerful folds and faults. Glacial deposits are plentiful in the valleys south of the Towy, striae abound on the Millstone Grit and show that the ice-sheet rose far up the slopes of the Black Mountains. Coal is the chief mineral, the iron-ore is no longer worked; the Carboniferous Limestone is burnt at Llandybû; fire-bricks are manufactured from the Millstone Grit, and a few lead-veins are found in the Ordovician rocks.

Industries. The climate is mild, except in the upland regions, but the annual rainfall is very heavy. With the exception of its south-eastern portion, which forms part of the great South Welsh coalfield, Carmarthenshire may be considered wholly as an agricultural county. The attention of the farmers is devoted to stock-raising and dairy-farming rather than to the growth of cereals, whilst the large tracts of unenclosed hill-country form good pastures for sheep and ponies. The soil varies much, but in the lower valleys of the Towy and Taf it is exceedingly fertile. Outside agriculture the gathering of cockles at the estuaries of the Towy and Tâf gives employment to a large number of persons, principally women; Ferriyside and Laugharne being the chief centres of the cockling industry. The local textile factories at Pencader, Penboyry, Llangeler, and in the valley of the Loughor are of some importance. Gold has been found near Caio in the Cotti valley, but the yield is trifling. There are lead-mines in various places, but none of great value. The really important industries are restricted to the populous south-eastern district, where coal-mining, iron-foundning and the smelting of tin and copper are carried on extensively at Llanelli, Pembrey, Tidydail, Carmant, Pontardulais, Ammanford and other centres.

Communications.—The Great Western railway traverses the lower part of the county, while the London & North-Western railway line passes near the extreme north-eastern point by a tunnel under the Sugar Loaf Mountain, and has its terminal station at Carmarthen. A branch line of the Great Western connects Llanelli with Llandilo by way of Ammanford, and another branch of the same railway runs northward from Carmarthen to Newcastle-Emlyn on the Teyfi, joining the Aberystwyth branch, formerly the Manchester & Milford line, at Pencader.

Population and Administration. — The area of the county is 587,516 acres, and the population in 1891 was 130,566 and in 1901 it was 135,325. The municipal boroughs are Carmarthen (pop. 9,933), Kidwelly (2,282) and Llandovery (1,809). Urban districts are Ammanford, Llanelli, Burry Port, Llandilo and Newcastle-Emlyn. The principal towns are Carmarthen, Llanelli (25,617), Llandilo or Llandelio Fawr (10,341), Llangadog (1,578), Llandovery, Kidwelly, Pembrey (7,513) and Laugharne (1,439). The county is in the South Wales circuit, and assizes are held at Carmarthen. County of Carmarthen has a commission of the peace and separate quarter sessions. The county is divided into two parliamentary divisions, the eastern and western, and it also includes the united boroughs of Carmarthen and Llandilo, thus returning three members in all to parliament. The ancient county, which contains 75 parishes and part of another, is the diocese of David's.

History. — Carmarthenshire originally formed part of the lands of the Dimetac conquered by the Romans, who constructed military roads and built on the Via Julia the important station of Maridunum upon or near the site of the present county town. After the retirement of the Roman forces this fortified town became known in course of time as Caerfyrrd, anglicized into Carmarthen, which subsequently gave its name to the county. During the 5th and 6th centuries Carmarthenshieh, or Ystrad Tywi, was the scene of the labours of many Celtic missionaries, notably of St David and St Teilo, who brought the arts of civilization as well as the doctrines of Christianity to its rude inhabitants. In the 9th century the whole of Ystrad Tywi was annexed to the kingdom of Roderick the Great (Rhodri Mawr), who at his death in 877 bequeathed the principality of South Wales to his son, Cadell. The royal residence of the South Welsh princes was now fixed at Dynevor (Dinefawr) on the Towy near Llandilo. Cadell's son, Howell the Good (Hywel Dda), was the first to codify the ancient laws of Wales at his palace of Ty Gwyn Ar Daf, the White Lodge on the banks of the Tâf, near the modern Whitland. In 1086, during the troubled reign of Rhys ap Tudor, the Normans first appeared on the shores of Carmarthen Bay, and before the end of King Henry I's reign had constructed the great castles of Kidwelly, Carmarthen, Laugharne and Llanstephan near the coast. From this period until the death of Prince Llewelyn (1282) the history of Carmarthenshire is national rather than local. By the Statutes of Rhuddlan (1284) Edward I. formed the counties of Cardigan and Carmarthen, and added the same tenures, and the appurtenances and possessions of the house of Dinefawr, which were now formally annexed to the English crown. Nearly a third of the present county, however, still remained under the jurisdiction of the Lords Marchers, and it was not until the Act 27 Henry VIII. that these districts, including the commotes of Kidwelly, Iscenni and Carthemwn, were added to Edward I's original shire. The prosperity of the new county increased considerably under Edward III., who named Carmarthen the chief staple-town in Wales for the wool trade. The revolt of Owen Glendower had the effect of disturbing the peace of the country for a time, and the French army, landed at Milford on his behalf, was warmly received by the people of Carmarthenshire. In the summer of 1485 Sir Rhys ap Thomas, of Abermarlais and Dinefawr, marched through the county collecting recruits for Henry of Richmond, for which service he was created a knight of the Garter and made governor of all Wales. At the Reformation the removal of the episcopal residence from distant St David's to Abergavenny, a village barely two miles from Carmarthen, brought the county into close touch with the chief Welsh diocese, and the new palace at Abergavenny will always be associated with Welsh history and religion. The Acts of Parliament and the Prayer Book, made by Bishop Richard Davies (1500-1581) and his friend William Salesbury, of Llanrwst (16th century). In the early part of the 17th century the county witnessed the first religious revival recorded in Welsh annals, that led by Rhys Prichard (d. 1644), the Puritan vicar of Llandovery, whose poetical works, the Canwyll y Cymry ("the Welshman's Candle") are still studied in the principality. At the time of the Civil Wars, Richard Vaughan, earl of Carlbury, the patron of Jeremy Taylor, was in command of the royal forces and troops, but made a very feeble and half-hearted resistance against the parliamentary forces. During the following century the great Welsh spiritual and educational movement, which later spread over all Wales, had its origin in the quiet and remote parish of Llanddowror, near Laugharne, where the vicar, the celebrated and pious Griffith Jones (1684-1761), had become the founder of the Welsh circulating charity schools. Other prominent members of this important Methodist revival, likewise natives of Carmarthenshire, were William Williams of Pantycelyn, the well-known hymn-writer (1716-1791), and Peter Williams, the Welsh Bible commentator (1722-1796). The county was deeply implicated in the Rebecca Riots of 1837-1839.

Foremost amongst the county families of Carmarthenshire is Rhys, or Rice, of Dynevor Castle, near Llandilo, a modern castellated house standing in a beautiful park which contains the historic ruin of the old Dinefawr fortress. The present Lord Dynevor, the direct lineal descendant of the princes of South Wales, is the head of this family. Almost opposite Dynevor...
Castle (formerly known as Newtown), on the left bank of the Towy, stands Golden Grove (Gelli Aur), once the seat of the Vaughans, ears of Carbery, whose senior line and titles became extinct early in the 18th century. The famous old mansion has been replaced by a modern Gothic structure, and is now the property of Earl Cawdor. Golden Grove contains the “Hirlass Horn,” the gift of King Henry VII. to Dafydd ap Evan of Llwyndafydd, Cardiganshire, perhaps the most celebrated of Welsh historical relics. Other families of importance, extinct or surviving, are Johnes, formerly of Abermarlais and now of Dolaucodi; Williams (now Drummond) of Edwinsford; Lloyd of Forest; Lloyd of Glansevin; Stepany of Llanelly and Gwynne of Taliaris.

Antiquities.—Cardmarcheshire contains few memorials of the Roman occupation, but it possesses various camps and tumuli of the British period, and also a small but perfect cromlech near Llangylwlen on the banks of the Tal. Of its many medieval castles the most important still in existence are: Kidwelly; Laugharne; Llanstephan, a fine pile of the 12th century on a hill at the mouth of the Towy; Carreg Cennen, an imposing Norman fortress crowning a cliff not far from Llandilo; and Dynevor Castle, the ancient seat of Welsh royalty, situated on a bold wooded height above the Towy. Of the ancient churches, Trymval, Cardmarches, Dryslwyn, Llandovery and Newcastle-Emlyn are interesting. Of the monastic houses Talley Abbey (Tal-y-Llychau, a name drawn from the two small lakes in the neighbourhood of its site) was founded by Rhys ap Griffith, prince of South Wales, towards the close of the 12th century for Benedictine monks; Whitland, or Albalaund, also a Benedictine house, was probably founded by Bishop Bernard of St David’s early in the 12th century, on a site long associated with Welsh monastic life; and the celebrated Augustinian Priory of St John at Cardmarches was likewise established in the 12th century. Very slight traces of these three important religious houses now exist. The parish churches of Cardmarcheshire are for the most part small and of no special architectural value. Of the more noteworthy mention may be made of St Peter’s at Cardmarchen, and of the parish churches at Laugharne, Kidwelly, Llangadock, Abergwili and Llangathen, the last named of which contains a fine monument to Bishop Anthony Rudd (d. 1615). Many of these churches are distinguished by tall massive western towers, usually of the 13th or 14th centuries. Besides Golden Grove and Dynevor the county contains some fine historic houses, prominent amongst which are Aber Marlais, late 18th century; Taf Castle, a Norman mansion; and the bishops’ residence of St David’s since the Reformation, burnt down in 1902, but rebuilt on the old lines; Abersglasney, a mansion near Llangathen, erected by Bishop Rudd and once inhabited by the poet John Dyer (1700–1758); Court Henry, an ancient seat of the Herbert family; and Abermarlais, once the property of Sir Rhys ap Thomas.

Customs, &c.—The old Welsh costume, folklore and customs have survived longer in Cardmarcheshire than perhaps in any other county of Wales. The steeple-crowned beaver hat, now practically extinct, was often to be seen in the neighbourhood of Cardmarchen as late as 1890, and the older women often affect the pais-a-gwn bâch, the frilled mob-cap and the small plaid shawl of a previous generation. Curious instances of old Welsh superstitions are to be found amongst the peasantry of the more remote districts, particularly in the lovely country in the valleys of the Towy and Teifi, where belief in fairies, fairy-rings, goblins and "corpses-candles" still lingers. The curious mumming, known as "Mari Lwyd" (Blessed Mary), in which one of the performers wears a horse’s skull decked with coloured ribbands, was prevalent round Cardmarchen as late as 1885. At many parish churches the ancient service of the “Pygyn” (a name said to be a corruption of the Latin pulli cantus) is held at daybreak or cock-crow on Christmas morning. A species of general catechism, known as pwrwnc, is also common in the churches and Nonconformist chapels. The old custom of receiving New Year’s gifts of bread and cheese, or meal and money (calenig), still flourishes in the rural parishes. The “bidding” before marriage (as in Cardiganshire) was formerly universal and is not yet altogether discontinued, and bidding papers were printed at Llandilo as late as 1900. The horse weddings (prio dae coffiau) were indulged in by the farmer class in the neighbourhood of Abergwili as late as 1880.

Authorities.—T. Nicholas, Annals and Antiquities of the Counties of Wales (London, 1852); W. Sparrow, Cardmarchen and its Neighbourhood (Cardmarchen, 1879); J. B. D. Tysen and Alwyn C. Evans, Royal Charters, &c., relating to the Town and County of Cardmarchen (Cardmarchen, 1878).

Carmathians (Qarmathians, Karhmathians), a Mahomedan sect named after Hamdan Qarman, who accepted the teaching of the Isma’ilites (see MAHOMMEDAN RELIGION: Sects) from Hosain ul-Ahwaz, a missionary of Ahmed, son of the Persian Abdallah ibn Maimun, toward the close of the 9th century. This was in the Sawd of Irak, which was inhabited by a people little attached to Islam. The object of Abdallah ibn Maimun had been to undermine Islam and the Araban power by a secret society with various degrees, which offered inducements to all classes and creeds and led men on from an interpretation of Islam to a total rejection of its teaching and a strict personal submission to the head of the society. For the political history of the Carmathians, their creeds and their decay, see ARABIA: HISTORY; CALIPHATE (sec. C. §§ 16, 17, 18, 23); and EGYPT: History (Mahomedan period).

In their religious teaching they claimed to be Shi’ites; i.e. they asserted that the imamate belonged by right to the descendants of Ali. Further, they were of the Isma’ilite branch of these, i.e. they acknowledged the claim to the imamate of Isma’il the eldest son of the sixth imam. The claim of Isma’il had been passed over by his father and many Shi’ites because he had been guilty of drinking wine. The Isma’ilites said that as the imam could do no wrong, his action only showed that wine-drinking was not sinful. Abdallah taught that from the creation of man there had always been an imam sometimes known, sometimes hidden. Isma’il was the last known; a new one was to be looked for. But while the imam was hidden, his doctrines were to be taught by his missionaries (dâ’âtes). Hamdan Qarman was one of these, Ahmed ibn Abdallah being nominally the chief. The adherents of this party were initiated by degrees into the secrets of its doctrines and were divided into seven (afterwards nine) classes. In the first stage the convert was taught the existence of the imam. In the second he was made to feel the necessity of a teacher who could explain it. He took an oath of complete submission and paid a sum of money. In the second stage the earlier teachers of Islam were shown to be wrong in doctrine and the imams alone were proved to be infallible. In the third it was taught that there were only seven imams and that the other sects of the Shi’ites were in error. In the fourth the disciple learnt that each of the seven imams had a prophet, who was to be obeyed in all things. The prophet of the last imam was Abdallah. The doctrine of Islam was that Mahomet was the last of the prophets. In the fifth stage the uselessness of tradition and the temporary nature of the precepts and practices of Mahomet were taught, while in the sixth the believer was induced to give up these practices (prayer, fasting, pilgrimage, &c.). At this point the Carmathian had completely ceased to be a Moslem. In the remaining degrees there was more liberty of opinion allowed and much variety of belief and teaching existed.

The last contemporary mention of the Carmathians is that of Na’ṣir ibn Khosrau, who visited them in A.D. 1050. In Arabia they ceased to exercise influence. In Persia and Syria their work was taken up by the Assassins (q.v.). Their doctrines are said, however, to exist still in parts of Syria, Persia, Arabia and India, and to be still propagated in Zanzibar.

See Journal asiatique (1877), vol. i, pp. 377-386. (G. W. T.)

Carmarthen, a town of southern France, in the department of Tarn, on the left bank of the Cérou, 20 m. by rail. Pop. (1906) 6186. The town gives its name to an important coal-basin, and carries on the manufacture of glass.

Carmel, the mountain promontory by which the seacoast of Palestine is interrupted south of the Bay of Acre, 33° 12’ N., 35° E. It continues as a ridge of oolitic limestone, broken by ravines and honeycombed by coves, running for about 20 m.
CARMELITES in a south-easterly direction, and finally joining the mountains of Samaria. Its maximum height is at 'Esfa, 1760 ft. It was included in the territory of the tribe of Asher. No great political event is recorded in connexion with it; it appears throughout the Old Testament "either as a symbol or as a sanctuary"; its name means "garden-land." Its fruitfulness is referred to by Isaiah and by Amos; Micah describes it as wooded, to which was no doubt due its value as a hiding-place (Amos ix. 3). It is now wild, only a few patches being cultivated; most of the mountain is covered with a thick bushwood of evergreens, oaks, myrtles, pines, &c., which is gradually being cleared away. That the cultivation was once much more extensive is indicated by the large number of rock-hewn wine and olive presses. Vines and olives are now found at 'Esfa only. The outstanding position of Carmel, its solitariness, its visibility over a wide area of country, and its fertility, marked it out as a suitable place for a sanctuary from very ancient times. It is possibly referred to in the Palestinian lists of Thothmes III. as Rosh Kodsū, "the holy headland." An altar of Jehovah existed here from early times; it was destroyed when the Phoenician Baal claimed the country under Jezebel, and repaired by Elijah (1 Kings xviii. 30) before the great sacrifice which decided the claims of the contending deities. The site of the present Carmelite monastery is El-Muhrafa, at the eastern end of the ridge. The Druses still visit this site, where is a dilapidated structure of stones, as a holy place for sacrifice. On the bank of the Kishon below is a mound known as Tell el-Kuds, "the Priest's mound," but the connexion that has been sought between this name and the slaughter of the priests of Baal is hardly justifiable. Other sites on the hill are traditionally connected with Elijah, and some melon-like fossils are explained as being fruits refused to him by its owner, who was punished by having them turned to stone. Elisha was stationed here for a time. Tachitus describes the hill as the site of an oracle, which Vespasian consulted. Iamblichus in his life of Pythagoras speaks of it as a place of great sanctity forbidden to the vulgar. A grove of trees, called the "Trees of the Forty " [Martyrs], still remains, no doubt in former times a sacred grove. So early as the 4th century Christian hermits began to settle here, and in 1207 the Carmelite order was organized. The monastery, founded at the fountain of Elijah in 1209, has had many vicissitudes: it was captured by the Turks, driven from Europe in 1552 and the building decayed; it was visited and refounded by St Louis in 1252; again despoiled in 1291; once more rebuilt in 1631, and, in 1695 (when the monks were massacred), sacked and turned into a mosque. Once more the monks established themselves, only to be murdered after Napoleon's retreat in 1799. The church and the monastery were entirely destroyed in 1821 by 'Abd Allah, pasha of Acre, on the plea that the monks would favour the revolting Greeks; but it was shortly afterwards rebuilt by order from the Porte, partly at 'Abd Allah's expense and partly by contributions raised in Europe, Asia and Africa by Brother Giovanni Battista of Frascati. The villages with which the mountain was once covered have been to a large extent depopulated by the Druses.

(R. A. S. M.)

CARMELITES, in England called White Friars (from the white mantle over a brown habit), one of the four mendicant orders. The stories concerning the origin of this order, seriously put forward and believed in the 17th and 18th centuries, are one of the curiosities of history. It was asserted that Elias established a community of hermits on Mount Carmel, and that this community existed without break until the Christian era and was nothing else than a Jewish Carmelite order, to which belonged the Sons of the Prophets and the Essenes. Members of it were present at St Peter's first sermon on Pentecost and were converted, and built a chapel on Mount Carmel in honour of the Blessed Virgin Mary, who, as well as the apostles, enrolled herself in the order. In 1668 the Holländisch Daniel Papenbroek (1628-1714), in the March volumes of the Acta Sanctorum, rejected these stories as fables. A controversy arose and the Carmelites had recourse to the Inquisition. In Spain they succeeded in getting the offending volumes of the Acta censured, but in Rome they were less successful, and so hot did the controversy become that in 1668 a decree was issued imposing silence upon both parties, until a formal decision should be pronounced—which has not yet been done.

The historical origin of the Carmelites must be placed at the middle of the 12th century, when a crusader from Calabria, named Berthold, and ten companions established themselves as hermits near the cave of Elias on Mount Carmel. A Greek monk, Phocas, who visited the Holy Land in 1183, gives an account of them, and says that the ruins of an ancient building existed on Mount Carmel; but though it is likely enough that there had previously been Christian monks and hermits on the spot, it is impossible to place the beginning of the Carmelite institute before Berthold. About 1210 the hermits on Carmel received from Albert, Latin patriarch of Jerusalem, a rule comprising sixteen articles. This was the primitive Carmelite rule. The life prescribed was strictly eremitical: the monks were to live in separate cells or huts, devoted to prayer and work; they met only in the oratory for the liturgical services, and were to live a life of great silence, seclusion, abstinence and austerity. This rule received papal approbation in 1226. Soon, however, the losses of the Christian arms in Palestine made Carmel an unsafe place for residence for western hermits, and so, c. 1240, the first establishment was made in Sicily and thence to Sicily, France and England. In England the first establishment was in 1243, and the second at Aylesford, where the first general chapter of the order was held in 1247, and St Simon Stock, an English anchorite who had joined the order, was elected general.

During his generalate the institute was adapted to the conditions of the western lands to which it had been transplanted, and for this purpose the original rule had to be in many ways altered: the austerities were mitigated, and the life was turned from eremitical into cenobitical, but on the mendicant rather than the monastic model. The polity and government were also organized on the same lines, and the Carmelites were turned into mendicants and became one of the four great orders of Mendicant Friars, in Europe distinguished as the "White Friars" from the white mantle worn over the dark brown habit. This change was made and the new rule approved in 1247, and under this form the Carmelites spread all over western Europe and became exceedingly popular, as an order closely analogous to the Dominicans and Franciscans. In the course of time, further relaxations of the rule were introduced, and during the Great Schism the Carmelites were divided between the two papal obediences, rival generals being elected,—a state of things that caused still further relaxations. To cope with existing evils Eugenius IV. approved in 1431 of a rule notably milder than that of 1247, but many houses clung to the earlier rule; thus arose among the Carmelites the same division into "observers" and "conventuals" that brought such mischief among the Franciscans.

During the 15th and 16th centuries various attempts at reform arose, as among other orders, and resulted in the formation of semi-independent congregations owing a titular obedience to the general of the order. The Carmelite friars seem to have flourished especially in England, where at the dissolution of the monasteries there were some 40 friaries. (See F. A. Gasquet, English Monastic Life, table and maps; Catholic Dictionary, art. "Carmelites.") There were no Carmelite nunneries in England, and indeed until the second half of the 16th century there were no nuns at all anywhere in the order.

Of all movements in the Carmelite order by far the most important and far-reaching in its results has been the reform initiated by St Teresa. After nearly thirty years passed in a Carmelite convent in Avila under the mitigated rule of 1431, she founded in the same city a small convent wherein a rule stricter than that of 1247 was to be observed. This was in 1562. In spite of opposition and difficulties of all kinds, she succeeded in establishing a number, not only of nunneries, but (with the co-operation of St John of the Cross, q.v.) of friaries of the strict observance; so that at her death in 1582 there were of the reform 15 monasteries of men and 17 of women, all in Spain. The interesting and dramatic story of the movement should be sought for in the biographies of the two protagonists; as also
CARMICHAEL—CARNAC 359

an account of the school of mystical theology founded by them, without doubt, the chief contribution made by the Carmelites to religion (see MYSTICISM). Here it must suffice to say that the idea of the reform was to go behind the settlement of 1247 and to restore and emphasize the purely contemplative character of primitive Carmelite life: indeed provision was made for the reproduction, for such as desired it, of the eremitical life led by Berthold and his companions. St. Teresa’s additions to the rule of 1247 made the life one of extreme bodily austerity and of prolonged prayer for all, two hours of private prayer daily, in addition to the choral canonical office, being enjoined. From the fact that those of the reform wore sandals in place of shoes and stockings, they have come to be called the Discalced, or bare-footed, Carmelites, also Teresians, in distinction to the Calced or older branch of the order. In 1568 the reformed monasteries were made a separate province under the general of the order, and in 1593 this province was made by papal act an independent order with its own general and government, so that there are now two distinct orders of Carmelites. The Discalced Carmelites spread rapidly all over Catholic Europe, and then to Spanish America and the East, especially India and Persia, and are there found by way of some extensive missionary undertakings. Both observances suffered severely from the various revolutions, but they both still exist, the Discalced being by far the most numerous and thriving. There are in all some 2000 Carmelites friars, and the nuns are much more numerous. In England and Ireland there are houses, both of men and of women, belonging to each observance.

Authorities.—A full account is given by Heyeot, Hist. des ordres religieux (1792), i. cc. 40-52; shorter accounts, continued to the end of the 19th century and giving references to all literature old and new, may be found in Max Heimbucher, Orden u. Kongregationen (1897), i. §§ 923 sqq. Wurtz, Kirchenlexikon der heid. (2), art. “Pentecostentag”; Herzog-Hauck, Realencyklopädie (ed. 3), art. “Karmeliter.” The story of St. Teresa’s reform will be found in lives of St. Teresa and in her writings, especially the Foundations. Special reference may be made to the works of Zimmerman, a Carmelite friar, Carmel in England (1899), and Monumenta historiae Carmelitana, i. (1905 fol.).

(E. C. B.)

CARMICHAEL, GEROSH (c. 1672-1720), Scottish philosopher, was born probably in London, the son of a Presbyterian minister who had been banished by the Scottish privy council for his religious opinions. He graduated at Edinburgh University in 1691, and became a regent at St. Andrews. In 1694 he was elected a master in the university of Glasgow—an office that was converted into the professorship of moral philosophy in 1727, when the system of masters was abolished at Glasgow. Sir William Hamilton regarded him as “the real founder of the Scottish school of philosophy.” He wrote Brevisius introductio ad Logicem, a treatise on logic and the psychology of the intellectual powers; Synopsis Theologiae Naturalis; and an edition of Pufendorf, De Officio Hominis et Civis, with notes and supplements of high value. His son Frederick was the author of Sermons on Several Important Subjects and Sermons on Christian Zeal, both published in 1733.

CARMINE, a pigment of a bright red colour obtained from cochineal (q.v.). It may be prepared by exhausting cochineal with boiling water and then treating the clear solution with alum, cream of tartar, stannous chloride, or acid nitrate of potassium; the colouring and animal materials present in the cochineal are then precipitated. Other methods are in use; sometimes white of egg, fish glue, or gelatine are added before the precipitation. The quality of carmine is affected by the temperature and the degree of illumination during its preparation—sunlight being requisite for the production of a brilliant hue. It differs also according to the amount of alumina present in it. It is sometimes adulterated with cinnabar, starch and other materials; from these the carmine can be separated by dissolving it in ammonia. Good carmine should crumble readily between the fingers when dry. Chemically, carmine is a compound of carminic acid with alumina, lime and some organic acid. Carmine is used in the manufacture of artificial flowers, water-colours, rouge, cosmetics and crimson ink, and in the painting of miniatures. “Carmine lake” is a pigment obtained by adding freshly precipitated alumina to decoction of cochineal.

CARMONA, a town of south-western Spain, in the province of Seville; 27 m. N.E. of Seville by rail. Pop. (1900) 17,215. Carmena is built on a ridge overlooking the central plain of Andalusia, from the Sierra Morena, on the north, to the peak of San Cristobal, on the south. It has a thriving trade in wine, olive oil, grain and cattle; and the annual fair, which is held in April, affords good opportunity of observing the costumes and customs of southern Spain. The citadel of Carmona, now in ruins, was formerly the principal fortress of Peter the Cruel (1350-1369), and contained a spacious palace within its defences. The principal entrance to the town is an old Moorish gateway; and the gate on the road to Cordova is partly of Roman construction. Portions of the ancient college of San Teodomir are of Moorish architecture, and the tower of the church of San Pedro is an imitation of the Giralda at Seville. In 1881 a large Roman necropolis was discovered close to the town, beside the Seville road. It contains many rock-hewn sepulchral chambers, with niches for the cinerary urns, and occasionally with vetustacles containing stone seats (briclinia). In 1881, an amphitheatre, and another group of tombs, all belonging to the first four centuries A.D., were disinterred near the original necropolis, and a small museum, maintained by the Carmona archaeological society, is filled with the mosaics, inscriptions, portrait-heads and other antiquities found here.

Carmona, the Roman Carmo, was the strongest city of Further Spain in the time of Julius Caesar (100-44 B.C.), and its strength was greatly increased by the Moors, who surrounded it with a wall and ornamented it with fountains and palaces. In 1247 Ferdinand III. of Castile took the city, and bestowed on it the motto Sicut Lucifer lucet in Aurora, sic in wandalia Carmona (“As the morning-star shines in the Dawn, so shines Carmona in Andalusia”).

For an account of the antiquities of Carmona, see Estudios arqueológicos e historicos, by M. Sales y Ferré (Madrid, 1887).

CARNAC, a village of north-western France, in the department of Morbihan and arrondissement of Lorient, 9 m. S.S.W. of Auray by road. Pop. (1906) 667. Carnac has a handsome church in the Renaissance style of Brittany, but it owes its celebrity to the stone monuments in its vicinity, which are among the most extensive and interesting of their kind (see STONE MONUMENTS). The most remarkable consist of long avenues of menhirs or standing stones; but there is also a profusion of other erections, such as dolmens and barrows, throughout the whole district. About half a mile to the north-west of the village is the Menec system, which consists of eleven lines, numbers 874 menhirs, and extends a distance of 3376 ft. The terminal circle, whose longest diameter is 300 ft., is somewhat difficult to make out, as it is broken by the houses and gardens of a little hamlet. To the east-north-east there is another system at Kermario (Place of the Dead), which consists of 855 stones, many of them of great size—some, for example, 18 ft. in height—arranged in ten lines and extending about 4000 ft. in length. Still further in the same direction is a third system at Kerlescan (Place of Burning), composed of 262 stones, which are distributed into thirteen lines, terminated by an irregular circle, and altogether extend over a distance of 1000 ft. or more. These three systems are the most important; and it is possible that other similar monuments have formed continuous series. Some of the menhirs, many of which have been broken up for road-mending and other purposes, have diminished in number by some thousands in modern times. The alignment of Kermario points to the dolmen of Kercado (Place of St Cado), where there is also a barrow, explored in 1863; and to the south-east of Menec stands the great tumulus of Mont St Michel, which measures 377 ft. in length, and has a height of 65 ft. The tumulus, which is crowned with a chapel, was excavated by René Galles in 1862; and the contents of the sepulchral chamber, which include several jade and fibrolite axes, are preserved in the museum at Vannes. About a mile east of the village is a small piece of moorland called the Bosseanno, from the bocennus or mounds with which it is covered; and here, in 1874, the explorations of
James Miln, a Scottish antiquary, brought to light the remains of a Gallo-Roman town. The tradition of Carnac is that there was once a sanctuary of the Templars or Red Cross Knights on the spot; but this, it seems, is not supported by history. Similar traces were also discovered at Mané Bras, a height about 3 m. to the east. The rocks of which these various monuments are composed is the ordinary granite of the district, and most of them present a strange appearance from their coating of white lichens. Carnac has an interesting museum of antiquities.

See W. C. Lukis, Guide to the Principal Chambered Barrows and Prehistoric Monuments in the Islands of the Morbihan, etc. (Ripon, 1857); René Galles, Feuilles du Mont Saint Michel en Carnaon, 4th ed. (Paris, 1857); and Jules Desruisseaux, Mémoires remontant dans le Morbihan (Vannes, 1853); James Miln, Archaeological Researches at Carnac in Brittany: Kerneoir (Edinburgh, 1881); and Excavations at Carnac: The Boiseno and the Mont St Michel (Edinburgh, 1877).

CARNARVON, EARLDOM OF. The earldom of Carnarvon was established in 1626 for Robert Dormer, Baron Dormer of Wynng (c. 1612-1643), who was killed at the first battle of Newbury whilst fighting for Charles I, and it became extinct on the death of his son Charles, the 2nd earl, in 1709. From 1744 to 1789 it was held by the family of Brydges, dukes of Chandos and marquesses of Carnarvon, and in 1793 Henry Herbert, Baron Forchever (1747-1811), was created earl of Carnarvon.

His great-grandson, Henry Howard Molyneux Herbert, 4th earl of Carnarvon (1831-1890), was born on the 24th of June 1831. He succeeded to the title in 1849, on the death of his father, John Henry George, the 3rd earl (1800-1849). Soon after taking his degree at Oxford he began to play a prominent part in the deliberations of the House of Lords. In 1858 he was under secretary for the colonies, and in 1866 secretary of state. In this capacity he introduced in 1867 the bill for the federation of the British North American provinces which set many political problems at rest; but he had not the privilege of passing it, having, before the measure became law, resigned, owing to his distaste for Disraeli's Reform Bill. Resuming office in 1874, he endeavoured to confer a similar boon on South Africa, but the chances were not ripe. In 1878 he again resigned, out of opposition to Lord Beaconsfield's policy on the Eastern question; but on his party's return to power in 1885 he became lord lieutenant of Ireland. His short period of office, memorable for a conflict on a question of personal veracity between himself and Mr. Parnell as to his negotiations with the latter in respect of Home Rule, was terminated by another premature resignation. He never returned to office, and died on the 29th of June 1880. As a statesman his career was marked by extreme sensitiveness; but he was beloved as a man of worth and admired as a man of culture. He was high steward of the university of Oxford, and president of the Society of Antiquaries. The 4th earl was succeeded by his son, George Edward Stanhope Molyneux (b. 1860).

CARNARVON, a market town and municipal borough, and the county town of Carnarvonshire, north Wales, 689 m. W. of Chester by the London & North-Western railway. Pop. (1901) 9760. It is the market town of the site of Caer Seint, settlement of Segontiaci, and was fortified in 1068 by Hugh Lupus, earl of Chester, after Roman occupation, a fort, baths and villa, with coins and pottery, having been exhumed here. As the castle was begun only in 1284, Edward II., supposed to have been born in its Eagle Tower on the extreme west, can only have been born outside. The castle is an irregular oblong building on the west of the town, surrounded by walls and having thirteen polygonal towers. There is still much of the town wall extant. The parish church (Llanbebogl) is some half-mile out of the town, the institutions of which include a town and county hall, a training college, and a gaol for Anglesey and Carnarvonshire jointly. Manufactures in the town are scanty, but Llanberis and Llanfyllin export hence slates, "sets" and copper ore. A steam ferry unites Carnarvon and Tan y foel, Anglesey, while a summer service of steamers runs to Menai Bridge, Bardsey, &c. The borough forms part of a district returning a member to parliament since 1536. To this district the Reform Act added Bangor. The county quarter sessions and assizes are held in the town, which has a separate commission of the peace, but no baronial court of quarter sessions. Three weekly Welsh (besides English) newspapers are published here.

CARNARVONSHIRE (Wales Carwfon, for Caer yn Arfon), a county of north Wales, bounded N. by the Irish Sea, E. by the county of Denbigh, S.E. by Merioneth, S. by Tremadoc and Cardigan Bays, S.W. by Carnarvon Bay, W. by the Menai Straits (separating the county from Anglesey), and N.W. by Conway Bay. Area, 656 sq. m. There is, owing to the changed bed of the Conway stream, a small detached part of the county on the north coast of Denbighshire, stretching inland for some 2½ m. between Old Colwyn and Llandulas. About half the whole length of the county is a peninsula, Lleyn, running south-west into the Irish Sea, and forming Cardigan Bay on the south and Carnarvon Bay on the north. The county is rich in minerals, e.g. lead, copper, some gold. Its slate quarries are many and good. Its mountains include the highest in England and Wales, the summit of Snowdon (Wydffela or Eryri) being 3560 ft. The principal mountains occupy the middle of the county and include Carnedd Llewllyn (3434 ft.), Carnedd Dafydd (3436), Glydwr Fawr (3345 ft.) and Yr Hen Capel (3529), Moel Siabdod (2860), Moel Hebog or Hebog (2566). The name of Snowdon is from the wildness of Pont Aberglaslyn gorse to the quiet of Nant Gwyfan. Those of Beddgelert and Llanberis—at the south and north base of Snowdon respectively—are famous, while that of the Conway, from Llanrwst to Conway (Conwy), is well set off by the background of Snowdonia.

The largest stream in the Conway, tidal and navigable for some 12 m. from Deganwy; this rises in Llyn Conway, in the southeast, divides Carnarvon from Denbigh (running nearly due north) for some 30 m. and falls into the sea at Deganwy. The Seint (wrongly spelled Seint) is a small stream rising in Snowdon and falling into the sea at Carnarvon, to which it gave its old name Segontium (Kaar Seint yn Arfon in the Maiobinogion). The Swallow Falls are near Nant Ffrancon (the stream of the Beaver or Afanc, a mythological animal). Nant Ffrancon leads north-west from near Capel Curig and Bettwy y coed and past Bethesda, reaching the sea in Beaumaris Bay. The lakes, numerous and occasionally large, include: Llyn Peris and Llyn Padarn at Llanberis, north of Snowdon; Llyn Ogwen, north of Glydwr Fawr; Llyn Cowlyd and Llyn Eigiau, both north of Capel Curig; Llyn Llydaw, on Snowdon; Llyn Cwellyn, west of Snowdon; Llyn Gwynant, east of Snowdon; Llyniad (Nant y llef or) Nantlle, near Llanfyllin; Llyn Conway.

The greater part of the county, including the mountainous Snowdon district and nearly all the eastern portion of the promontory of Lleyn, is occupied by rocks of Ordovician age, the Arenig, Bala and Llanbedr series. These are dark slates and thin-bedded grits with occasional interbedded igneous rocks, slates, and the products of contemporaneous volcanoes. At the base of Snowdon are Bala grits and slates, above them lie three beds of felspathic porphyry, which are in turn succeeded by a great mass of calcareous and sandy volcanoclastic rocks, while on the summit are the remnants of a lava sheet. The whole mountain is part of a syncline, the beds dipping into it from the north-west and south-east.

Next to the Ordovician, the Cambrian rocks are the most important. They are the intermediate rocks of the county, in the north-west, and extends from Bangor to Bethesda, through Llyn Cwellyn and Llanwada to the coast near Clynnogfawr. The second area lies west of Tremadoc, which has given its name to the upper segment of the Carneddau, and the Carneddau itself, and stretches south of Llanenga. Cambrian slates are extensively quarried at Penrhyn, Llanberis and Dinorwic. Pre-Cambrian schists and igneous rocks occupy a strip, from 2 to 3 m. wide, along the coast from Neirn to Llanbedrog Bay. On the island of Anglesey the Silurian region enters this county near Conway near the eastern border; it comprises Tarannon shale and Wenlock beds with grittites.

The striking headland of the Great Orme as well as Little Orme's Head, Llandudno, is composed of grey sandstone, containing corals, and large Productus shells. A narrow slip of the same formation runs along the Menai Straits for several miles south of the tubular bridge. At the southern extremity of the limestone a small patch of coal measures is found. General drift—sandstone, boulders and clay—is abundant along the northern coast, and in the neighbourhood of Snowdon it is an important feature in the landscape; massive moraines, perched blocks, striated stones and other evidences of ice action are common.
Moel Trygarn and on the western flanks of Snowdon marine shells have been found in the drift up to an elevation of 1,400 ft. above sea-level. Blown sand occurs along the coast near Conway, southwest of Carnarvon and on the south coast. Several hollows and pipes in the carboniferous limestone about Orme's Head contain clays and sands of mixed origin, including Upper Carnian, Triassic and drift materials. The igneous rocks, especially those of volcanic origin, constitute one of the most striking geological features of the county; they comprise felsites, rhyolites, quartz porphyries, enstatite diabases, andesite tuffs, diabases and granite.

The climate is cold and damp in winter, except in the peninsula, Lleyn, and on the mild coast. Arable land, but a small proportion of the surface, is mostly in the Conwy valley or near the sea. Principal crops are oats, barley and potatoes, with some little wheat. The valley soil (alluvial) is often fertile, chiefly as meadow and enclosed pasture. Dairy and sheep-farming occupy most farmers. The small mountain pastures, especially of Lleyn (Conwy Vale), are famous, and Welsh ponies were known for staying power even to Arrian (Cynegetics). Agriculture still too much follows the old routine, besides losing by the influx of labour into the towns or to the mining industry and "set works" (stone).

The county is served by the London & North-Western railway; its terminus is Afon Wen, within 4 m. of Pwllheli. Between these stations plies the Cambrian, which runs along the Cardigan Bay coast and terminates at Pwllheli. The North Wales Narrow Gauge line runs from Dinas, south of Carnarvon, to Snowdon Ranger, 4 m. from Beddgelert. The main line of the London & North-Western runs along the northern coast, with branches from Llandudno junction to Blaenau Festiniog, along the Denbighshire side of the Conwy stream; from Menai Bridge to Carnarvon (thence continuing to Llanberis, or, by another line, to Afon Wen). The chief ports are Portmadoc, Pwllheli, Carrog, Port Dinorwic and Bangor. North of Portmadoc is Criccieth, with a castle resorted to by visitors; Pwllheli is also a summer resort, and a tramway runs thence to within a short distance of Abersoch, another favourite watering-place. Nefyn (some 6 m. from Pwllheli), still unserved by rail or tram, was the scene of a royal tournament in the 15th century, and is another bathing resort; near are Carreg Llan and Fistyll farm (see Barosey).

The area of the ancient county is 361,156 acres, with a population in 1901 of 2,16,882. The area of the administrative county is 365,086 acres. The inhabitants practically all speak Welsh (slightly differing, especially in Lleyn, from that of Anglesey). Over 80 is the percentage in Carnarvonshire, as against over 90 for Anglesey. The county is divided into two parliamentary divisions, south (Eifion) and north (Arfon).

The Carnarvon district of boroughs is formed of Bangor city, Carnarvon, Conway, Criccieth, Nefyn and Pwllheli. There are four municipal boroughs: Bangor (pop. 11,269), Carnarvon (9760), Conway (4681) and Pwllheli (3675). Other electoral districts are: Bethesda (1581), Betws y Coed (1070), Criccieth (1406), Llandudno (2570), Llanfairfechan (7690), Penmaenmawr (3503) and Ynyscynhaearn (1883). Carnarvon, where assizes are held, is in the north Wales circuit. Except a few parishes (in and near Llandudno) in St Asaph diocese, Carnarvonshire is in the diocese of Bangor, and contains sixty-one ecclesiastical parishes or districts, with parts of four others. Bangor, Carnarvon, Pwllheli and Llandudno are the principal towns, with Criccieth, Nefyn, Portmadoc and Tremadoc.

Carnarvonshire was occupied by the Segontiaci, with difficulty subdued by Subrius Scapula and C. Suetonius Paulinus (Paulinus). From here Agricola crossed to conquer Anglesey. Relics of British fort and camps have been discovered. Caerhun (Caer Rhun) near Bangor and Criccieth (Caer Seint) are respectively the old Conovium and Segontium of Britannia Secunda. The county was part of Gwynedd kingdom, until Edward I. in 1277 restricted that to Snowdon proper. The early fortresses at Deganyw, Dinorwic, Dinas Dinlle, &c., and the later castles of Conway (Conwy), Carnarvon, Criccieth and Dolbadarn, bear witness to the warlike character of its inhabitants.

CARNATIC, or KARNATAK (Kannada, Karnata, Karnatakadesa), a name given by Europeans to a region of southern India, between the Eastern Ghats and the Coromandel coast, in the presidency of Madras. It is ultimately derived, according to Bishop Caldwell (Grammar of the Dravidian Languages), from kar, "black," and nodas, "country," i.e. "the black country," a term very suitable to designate the 'black cotton soil,' as it is called, of the plateau of the Southern Deccan. Properly the name is, in fact, applicable only to the country of the Kanarese extending between the Eastern and Western Ghats, over an irregular area narrowing northwards, from Palghat in the south to Bidar in the north, and including Mysore. The extension of the name to the country south of the Karnata was probably due to the Mahomedan conquerors who in the 16th century overthrew the kingdom of Vijayanagar, and who extended the name which they found used of the country north of the Ghats to that south of them. After this period the plain country of the south came to be called Karnata Payanghat, or "lowlands," as distinguished from Karnata Balaghat, or "highlands." The misapplication of the name Carnatic was carried by the British a step further than by the Mahomedans, it being confined by them to the country below the Ghats, Mysore not being included. Officially, however, this name is no longer applied, the Carnatic having become a mere geographical term. The administration of the Karnata (or rather Karnatak) is now applied only to the Bombay portion of the original Karnata, viz. the districts of Belgaum, Dharwar and Bijapur, part of North Kanara, and the native states of the Southern Mahratta agency and Kolhapur.

The region generally known to Europeans as the Carnatic, though no longer a political or administrative division, is of great historical importance. It extended along the eastern coast about 600 m. in length, and from 50 to 100 m. in breadth. It was bounded on the north by the Guntur circuit, and thence it stretched southward to Cape Comorin. It was divided into the Southern, Central and Northern Carnatic. The region south of the river Coleroon, which passes the town of Trichinopoly, was called the Southern Carnatic. The principal towns of this division were Tanjore, Trichinopoly, Madura, Tranquebar, Negapatam and Tinnevelly. The Central Carnatic extended from the Coleroon river to the river Pennai; its chief towns were Madras, Pondicherry, Arcot, Vellore, Cuddalore, Pulicat, Nellore, &c. The Northern Carnatic extended from the river Pennai to the northern limit of the country; and the chief town was Ongole.1 The Carnatic, as above defined, comprehended within its limits the maritime provinces of Nellore, Cingleput, South Arcot, Tanjore, Madura and Tinnevely, and the inland districts of North Arcot and Trichinopoly. The population of this region consists chiefly of Brahmanical Hindus, the Mahomedans being but thinly scattered over the country. The Brahmans rent a great proportion of the land, and also fill different offices in the collection of the revenue and the administration of justice. Throughout the country they appropriate to themselves a particular quarter in every town, generally the strongest part of it. Large temples and other public monuments of civilization abound. The temples are commonly built in the middle of a square area, and enclosed by a wall 15 or 20 ft. high, which conceals them completely from the public view, as they are never raised above it.

At the earliest period of which any records exist, the country known as the Carnatic was divided between the Pandya and Chola kingdoms, which with that of Chera or Kerala formed the three Tamil kingdoms of southern India. The Pandya kingdom practically coincided in extent with the districts of Madura and Tinnevelly; that of the Cholas extended along the Coromandel coast from Nellore to Pudukottai, being bounded on the north by the Pennar river and on the south by the Southern Vellaru. The government of the country was shared for centuries with these dynasties by numerous independent or semi-independent chiefs, evidence of whose perennial internecine conflicts is

1 As a geographical term, Carnatic is not now applied to the district north of Pennai.
preserved in the multitudes of forts and fortresses the deserted ruins of which crown almost all the elevated points. In spite, however, of this passion of the military classes for war the Tamil civilization, developed in the country was of a high type. This was largely due to the wealth of the country, famous in the earliest times as now for its pearl fisheries. Of this fishery Korkai (the Greek Kακχ), now a village on the Tambraparni river in Tinnevelly, but once the Pandy capital, was the centre long before the Christian era. In Pline's day, owing to the silting up of the harbour, its glory had already decayed and the Pandya capital had been removed to Madura (Hist. Nat. i. cap. xxii. 20), famous later as a centre of Tamil literature. The Chola kingdom, which four centuries before Christ had been recognized as independent by the great Maurya king Asoka, had for its chief port Kavirajpadinam at the mouth of the Cauvery, every vestige of which is now buried in sand. For the first two centuries after Christ a large sea-born trade was carried on between the Roman empire and the Tamil kingdoms; but after Caracalla's massacre at Alexandria in A.D. 215 this ceased, and with it all intercourse with Europe for centuries. Henceforward, until the 9th century, the history of the country is illustrated only by occasional and broken lights. The 4th century saw the rise of the Pallava power, 1 for which some 400 years encroached on, without extinguishing, the Tamil kingdoms. When in A.D. 640 the Chinese traveller Hai Nian visited Chola-Kanchi (at the time capital of the Chola kingdom), he learned that the kingdom of Chola (Chu-li-ya) embraced but a small territory, wild, and inhabited by a scanty and fierce population; in the Pandya kingdom (Malakuta), which was under Pallava suzerainty, literature was dead. Buddhism all but extinct, while Hinduism and the naked Jain saints divided the religious allegiance of the people, and the pearl fisheries continued to flourish. The power of the Pallava kings was shaken by the victory of Vikramaditya Chalukya in A.D. 740, and shattered by Aditya Chola at the close of the 9th century. From this time onward the inscriptions records are abundant. The Chola kingdom, which in the 9th century had been weak, now revived, its power culminating in the victories of Rajaraja the Great, who defeated the Chalukyas after a four years' war, and, about A.D. 994, forced the Pandya kings to become his tributaries. A magnificent temple at Tanjore, once his capital, preserves the records of his victories engraved upon its walls. His career of conquest was continued by his son Rajendra Choladeva I., self-styled Gangaikonda owing to his victorious advance to the Ganges, who succeeded to the throne in A.D. 1018. The ruins of the new capital which he built, called Pallava Chola-patnam, still denote the position of the Trichinopoly district. His successors continued the eternal wars with the Chalukyas and other dynasties, and the Chola power continued in the ascendent until the death of Kulottunga Chola III. in 1278, when a disputed succession caused its downfall and gave the Pandyas the opportunity of gaining for a few years the upper hand in the south. In 1310, however, the Mahommedan invasion under Malik Kafur overwhelmed the Hindu states of southern India in a common ruin. Though crushed, however, they were not extinguished; a period of anarchy followed, the struggle between the Chola kings and the Mussulmans issuing in the establishment at Kanchi of a usurping Hindu dynasty which ruled till the end of the 14th century, while in 1365 a branch of the Pandyas succeeded in re-establishing itself in part of the kingdom of Madura, where it survived till 1623. At the beginning of the 15th century the whole country had come under the rule of the kings of Vijayanagar; but in the anarchy that followed the overthrow of the Vijayanagar empire by the Mussulmans in the 16th century, the Hindu viceroyes (nayakkar) established in Madura. Tanjore and Kanji made themselves independent, only in their turn to become tributary to the kings of Golconda and Bijapur, who divided the Carnatic between them. Towards the close of the 17th century the country was reduced by the armies of Aurangzeb, who in 1652 appointed Zulfikar Ali nawab of the Carnatic, with his seat at Arcot. Meanwhile, the Mahatta power had begun to develop; in 1677 Sivaji had suppressed the last remnants of the Vijayanagar power in Vellore, Gingee and Kurnool, while his brother Ekoji, who in 1674 had overthrown the Nayakkas of Tanjore, established in that city a dynasty which lasted for a century. The collapse of the Delhi power after the death of Aurangzeb produced further changes. The nawab Saadet-ullah of Arcot (1710-1732) established his independence; his successor Dost Ali (1732-1740) conquered and annexed Madura in 1736, and his successors were confirmed in their position as nawabs of the Carnatic by the nizam of Hyderabad after that potentate had established his power in southern India. After the death of the nawab Mahommed Anwar-ud-din (1744-1749), the succession was disputed between Mahommed Ali and Husein Dost. In this an unusual French and English, then competing for influence in the Carnatic, took opposite sides. The victory of the British at the battle of Vayaluri, in 1748, established Mahommed Ali in power over part of the Carnatic till his death in 1795. Meanwhile, however, the country had been exposed to other troubles. In 1741 Madura, which the nawab Dost Ali (1732-1740) had added to his dominions in 1736, was conquered by the Maharrattas; and in 1743 Hyder Ali of Mysore overran and ravaged the central Carnatic. The latter was reconquered by the British, to whom Madura had fallen in 1758; and, finally, in 1801 all the possessions of the nawab of the Carnatic were transferred to them by a treaty which stipulated that an annual revenue of several lakhs of pagodas should be reserved to the nawab, and that the British should undertake to support a sufficient civil and military force for the protection of the country and the collection of the revenue. On the death of the nawab in 1823 it was determined to put an end to the nominal sovereignty, a liberal establishment being provided for the family. The southern Carnatic, when it came into the possession of the British, was occupied by military chieftains called poligars, who ruled over the country, and held lands by doubtful tenures. They were unquestionably a disorderly race; and the country, by their incessant feuds and plunderings, was one continued scene of strife and violence. Under British rule they were reduced to order, and their forts and military establishments were destroyed.

See INDIA: History. For the various applications of the name Carnatic see the Imperial Gazetteer of India (Oxford, 1898), i. e. ; for the results of the latest researches in the early history of the country see V. A. Smith, Early History of India (2nd ed., Oxford, 1908), and Robert Sewell, A Forgotten Empire (Vijayanagar), (London, 1900).

CARNATION (Dianthus Caryophyllus, natural order Caryophyllaceae), a garden flower, a native of southern Europe, but occasionally found in an apparently wild state in England. It has long been held in high estimation for the beauty and the delightful fragrance of its blossoms. The varieties are numerous, and are ranged under three groups, called bizarres, flakes and picotes. The last, from their distinctness of character, are now generally looked upon as if they were a different plant, whereas they are, in truth, but a seminal development from the carnation itself, their number and variety being entirely owing to the adventitious and irregular endeavours of the modern florist to vary and to improve them.

The true carnations, as distinguished from picotees, are those which have the colours arranged in longitudinal stripes or bars of variable width on each petal, the ground colour being white. The bizarres are those in which stripes of two distinct colours occur on the white ground, and it is on the purity of the white ground and the clearness and evenness of the stripping that the technical merit of each variety rests. There are scarlet bizarres.
CARNEA—CARNEADES

marked with scarlet and maroon, crimson bizarres marked with crimson and purple, and pink and purple bizarres marked with these two colours. The flowers have stripes of only one colour on the white ground; purple flowers are striped with purple, scarlet flowers with scarlet, and rose flowers with rose colour. The selfs, those showing one colour only, as white, yellow, crimson, purple, &c., are commonly called cloves.

The picotee has the petals laced instead of striped with a distinct colour; the subgroups are red-edged, purple-edged, rose-edged and scarlet-edged, all having white grounds; each group divides into two sections, the heavy-edged and the light-edged. In the heavy-edged the colour appears to be laid on in little touches, passing from the edge inwards, but so closely that they coalesce into one line of colour from 1/2 to 1/3 of an inch broad, and more or less feathered on the inner edge, the less feathered the better; the light-edged display only a fine edge, or “wire” edge, of colour on the white ground. Yellow picotees are a group of great beauty, but deficient in correct marking.

During the decade 1898–1908 a new American race of carnations became very popular with British growers. As the plants flower chiefly during the winter—from October till the end of March—they are known as winter-flowering carnations. The ideal variety is that which has the charming delicacy and colouring of the blossoms and for the length of the flower-stalks. This enables them to be used with great effect during the dullest months of the year for all kinds of floral decorations. These varieties are propagated by layers or cuttings or “pippings.”

“Marguerite” carnations are lovely annuals remarkable for their beautifully fringed blossoms. They are easily raised from seeds every year, and should be treated like half-hardy annuals.

What trade growers call “jacks” are seedling carnations with single flowers of no great value or beauty. Thousands of these are raised every year for supplying “grass” (as the foliage is called) to put with choice varieties. Costermongers take advantage of the ordinary householder’s ignorance of plants by selling “jacks” as choice varieties at a high price.

Carnations are usually propagated by “layering” the non-flowering shoots about the second or third week in July, in the open air; but almost at any period when proper shoots can be obtained under glass. Cuttings or “pippings” are also inserted in rich but very gritty composts in boxes, in pots, or in beds with gentle heat in greenhouses. The rooted layers may be removed and potted out towards the end of September, or early in October, the choice sorts being potted in rather small pots and kept in a cold frame during winter, when damp is dangerous.

New varieties can only be obtained from carefully saved seeds, or when a “sport” is produced—i.e., when a shoot with a flower differing entirely in colour from that of the parent plant appears unexpectedly. “Malmaison” carnations arose in this way, and are largely cultivated in greenhouses.

The soil for carnations and picotees should be a good turfy loam, free from wireworm, and as fibby as it can be obtained; to four parts of this add one part of rotten manure and one of leaf-mould, with sufficient sharp sand to keep it loose. A moderate addition of old lime rubbish will also be an advantage. This should be laid up in a dry place, and frequently turned over so as to be in a free friable condition for use towards the end of February or early in March.

Carnations are subject to several diseases, the worst being the “rust” (Uromyces Caryophylli), “leaf-spot” and maggot.

The first two are checked or prevented by spraying the plants with sulphide of potassium (1 oz. to 10 gallons of water), taking care to avoid the painted woodwork; while the only way to deal with the carnation maggot is to pierce the centre of attacked plants with a needle, and to destroy the eggs whenever they are observed.

Descriptive lists of the best varieties may be had from all the leading nurseries.

CARNEA, one of the great national festivals of Sparta, held in honour of Apollo Carneus. Whether Carneus (or Carnus) was originally an old Peloponnesian divinity subsequently identified with Apollo, or merely an “emanation” from him, is uncertain; but there seems no reason to doubt that Carneus means “the god of flocks and herds” (Hesychius, s.v. Κάρνος), in a wider sense, of the harvest and the vintage. The chief centre of his worship was Sparta, where the Carneus took place every year from the 7th to the 15th of the month Carneus (= Metageitnion, August). During this period all military operations were suspended. The Carneus appears to have been at once agrarian, military and punic in character. In the last aspect it is supposed to commemorate the death of Carneus, an Acarnian seer and favourite of Apollo, who, being suspected of espionage, was slain by one of the Heraclidae during the passage of the Doriacs from Naupactus to Peloponnesus. By way of punishment, Apollo visited the army with a pestilence, which only ceased after the institution of the Carneus. The tradition is probably interted to explain the sacrifice of an animal (perhaps a later substitute for a human being) as the representative of the god.

The agrarian and military sides of the festival are clearly distinguished. (1) Five unmarried youths (Χαραλάσται) were chosen by lot from each tribe for four years, to superintend the proceedings, the officiating priest being called ἄγων ("leader "). There were two or more such youths for each tribe, who each had his own adjutant. The different parties were running, pursued by a band of young men called στηρυφωλάρχοι ("running with bunches of grapes in their hands "); if he was caught, it was a guarantee of good fortune to the city; if not, the reverse. (2) In the second part of the festival nine tents were set up in the country, in each of which nine citizens, representing the phratries (or obae), feasted together in honour of the god (for huts or booths extemporized as shelters compare the Jewish feast of Tabernacles; and see W. Warde Fowler in Classical Review, March 1908, on the country festival in Tibuslii ii. 1). According to Demetrius of Sccepsis (in Athenaeus iv. 141), the Carneus was an imitation of life in camp, and everything was done in accordance with the command of a herald. In regard to the sacrifice, which doubtless formed part of the ceremonial, all that is known is that a ram was sacrificed at Thurii. Other indications point to the festival having assumed a military character at an early date, as might have been expected among the warlike Dorians, although some scholars deny this. The general meaning of the agrarian ceremony is clear, and has numerous parallels in north European harvest-customs, in which an animal (or man disguised as an animal) was pursued by the reapers, the animal if caught being usually killed; in any case, both the man and the animal represent the vegetation spirit. E. H. Binney in Classical Review (March 1905) suggests that the story of Alcestis was performed at the Carneus (to which it may have become attached with the name of Apollo) as a vegetation drama, and "embodied a Death and Resurrection Ceremony."

The great importance attached to the festival and its month is shown in several instances. It was responsible for the delay which prevented the Spartans from assisting the Athenians at the battle of Marathon (Herodotus vi. 106), and for the despatch of a small advance guard under Leonidas to hold Thermopylae instead of the main army (Herodotus vii. 206). Again, when Epidaurus was attacked in 419 by Argos, the movements of the Spartans under Agis against the latter were interrupted until the end of the month, while the Argives (on whom, as Doriacs, the attack was expected) by manipulating the calendar, avoided the necessity of suspending operations (see Grote, Hist. of Greece, ch. 56; Thucydides v. 54).

CARNEADES (214–129 B.C.), Greek philosopher, founder of the Third or New Academy, was born at Cyrene. Little is known of his life. He learned dialectics under Diogenes the Stoic, and under Hegesinus, the third leader of the Academy in descent from Arcesilaus. The chief objects of his study, however,
were the works of Chrysippus, opposition to whose views is the mainspring of his philosophy. "If Chrysippus had not been," he is reported to have said, "I had not been either." In 155, together with Diogenes the Stoic and Critolaus the Peripatetic, he was sent on an embassy to Rome to justify certain depredations committed by the Athenians in the territory of Crotus. On this occasion he delivered two speeches on successive days, one in favour of justice, the other against it. His powerful reasoning excited among the Roman youth an enthusiasm for philosophical speculations, and the elder Cato insisted on Carneades and his companions being dismissed from the city.

Carneades, practically a 5th-century sophist, is the most important of the ancient sceptics. Negatively, his philosophy is a polemic against the Stoic theory of knowledge in all its aspects. All our sensations are relative, and acquaint us, not with things as they are, but only with the impressions that things produce upon us. Experience, he says, clearly shows that there is no true impression. There is no notion that may not deceive us; it is impossible to distinguish between false and true impressions; therefore the Stoic phainomena kataleptika (see Stoics) must be given up. There is no criterion of truth. Carneades also assailed Stoic physics.

In addition to this, of definite instance, he points to those things which cause destruction and danger to man, to the evil committed by men endowed with reason, to the miserable condition of humanity, and the misfortunes that assail the good man. There is, he concludes, no evidence for the doctrine of a divine superintending providence. Even if there were thereby connexion of parts in the universe, this may have resulted quite naturally. No proof can be advanced to show that this world is anything but the product of natural forces. Carneades further attacked the very idea of God. He points out the contradiction between the attributes of infinity and individuality. Like Aristotle, he insists that virtue, being relative, cannot be ascribed to God. Not even intelligence can be an attribute of the divine Being. Nor can he be conceived of as corporeal or incorporeal. If corporeal, he must be simple or compound; if a simple and elementary substance, he is incapable of life and thought; if compound, he contains in himself the elements of dissolution. If incorporeal, he can neither act nor feel. In fact, nothing whatever can be asserted with certainty in regard to his existence or power.

The positive side of his teaching resembles in all essentials that of Arcesilaus (q.v.). Knowledge being impossible, a wise man should practise ἔγκνη (suspension of judgment). He will not even be sure that he can be sure of nothing. Ideas or notions are never true, but only probable; nevertheless, there are degrees of probability, and hence degrees of belief, leading to action. According to Carneades, an impression may be probable in itself; probable and uncontradicted (ἀπεριτωτοι, lit. "not pulled aside," not distracted by synchronous sensations, but shown to be in harmony with them) when compared with others; probable, uncontradicted, and thoroughly investigated and confirmed. In the first degree there is a strong persuasion of the propriety of the impression made; the second and third degrees are produced by comparisons of the impression with others associated with it, and an analysis of itself. His views on the summumтехnon are not clearly known even to his successor Clitomachus. He seems to have held that virtue consisted in the direction of activity towards the satisfaction of the natural impulses. Carneades left no written works; his opinions seem to have been systematized by Clitomachus.

CARNEGIE, ANDREW (1837— ), American "captain of industry" and benefactor, was born in humble circumstances in Dunfermline, Scotland, on the 25th of November 1837. In 1848 his father, who had been a Chartist, emigrated to America, settling in Allegheny City, Pennsylvania. The raw Scots lad started work at an early age as a bobbin-boy in a cotton factory, and a few years later was engaged as a telegraph clerk and operator. His capacity was perceived by Mr T. A. Scott of the Pennsylvania railway, who employed him as a secretary; and in 1859, when Scott became vice-president of the company, he made Carnegie superintendent of the western division of the line. In this post he was responsible for several improvements in the service; and when the Civil War opened he accompanied Scott, then assistant secretary of war, to the front. The first sources of the enormous wealth he subsequently attained were his introduction of sleeping-cars for railways, and his purchase (1864) of Storey Farm on Oil Creek, where a large profit was secured from the oil-wells. But this was only a preliminary to the success attending his development of the iron and steel industries at Pittsburg. Foreseeing the extent to which the demand would grow in America for iron and steel, he started the Keystone Bridge works, built the Edgar Thomson steel-rolling mill, bought out the rival Homestead steel works, and by 1888 had under his control an extensive plant served by tributary coal and iron fields, a railway 425 m. long, and a line of lake steamships. As years went by, the various Carnegie enterprises represented in this industry prospered to such an extent that in 1899 the United States Steel Corporation, a trust organized by Mr J. Pierpont Morgan, and Mr Carnegie himself retired from business, he was bought out at a figure equivalent to a capital of approximately $100,000,000.

From this time forward public attention was turned from the shrewd business capacity which had enabled him to accumulate such a fortune to the public-spirited way in which he devoted himself to utilizing it on philanthropic objects. His views on social subjects, and the responsibilities which great wealth involved, were already known in a book entitled Triumphant Democracy, published in 1886, and in his Gospel of Wealth (1900). He acquired Skibo Castle, in Sutherlandshire, Scotland, and made his home partly there and partly in New York; and he devoted his life to the work of providing the capital for purposes of public interest, and social and educational advancement. Among these the provision of public libraries in the United States and United Kingdom (and similarly in other prosperous countries), was especially prominent, and "Carnegie libraries" gradually spread far and wide, the method being to build and equip, but only on condition that the local authority provided site and maintenance, and thus to secure local interest and responsibility. By the end of 1908 he had distributed over £6,000,000 for founding libraries alone. He gave £2,000,000 in 1901 to start the Carnegie Institute at Pittsburgh, and the same amount (1902) to found the Carnegie Institution at Washington, and in both of these, and other cases, he added later to the original endowment. In Scotland he gave £2,000,000 in 1901 to establish a trust for providing funds for assisting education at the Scottish universities, a benefaction which resulted in his being elected lord rector of St Andrews University. He was a large benefactor of the Tuskegee Institute under Booker Washington for negro education. He also established large pension funds—in 1901 for his former employees at Homestead, and in 1905 for American college professors. His benefactions in the shape of buildings and endowments for education and research are too numerous for detailed enumeration, and are noted in this work under the headings of the various localities. But mention must also be made of his founding of Carnegie Hero Fund commissions, in America (1904) and in the United Kingdom (1908), for the recognition of deeds of heroism; his contribution of £500,000 in 1903 for the erection of a Temple of Peace at The Hague, and of £150,000 for a Pan-American Palace in Washington as a home for the International Bureau of American Republics. In all his ideas he was dominated by an intense belief in the future and influence of the English-speaking people, in their democratic government and alliance for the purpose of peace and the abolition of war, and in the progress of education on unsectarian lines. He was a powerful supporter of the movement for spelling reform, as a means of promoting
the spread of the English language. Mr Carnegie married in 1887 and had one daughter. Among other publications by him were *An American Four-in-hand in Britain* (1885), *Round the World* (1886), *The Empire of Business* (1902), a *Life of James Watt* (1905) and *Problems of To-day* (1908).

CARRIEGIE, a borough of Allegheny county, Pennsylvania, U.S.A., 6 m. S.W. of Pittsburg. Pop. (1900) 7,330 (1816 being foreign-born); (1910) 10,009. It is served by the Pittsburg, Cincinnati, Chicago & St Louis, the Pittsburg, Chartiers & Young-hiogheny, and the Wabash Pittsburg Terminal railways, and the Pittsburg street railway. Carnegie is situated in the beautiful valley of Chartiers Creek, and is in one of the coal and natural gas districts of the state. In the borough are a Carnegie library and St Paul’s orphan asylum. Among the borough’s manufactures are steel, lead, glass, ploughs and enamel- and tin-ware. There are alkaline and lithia mineral springs here. In 1894 Carnegie, named in honour of Andrew Carnegie, was formed by the union of the boroughs Chartiers and Mansfield.

CARNEIAN, a red variety of chalcedony, much used as an ornamental stone, especially for seals. The old name was cornelian, said to have been given in reference either to the horn appearance of the stone, or its resemblance in colour to the berry of the cornel; but the origin of the word was corrupted to cornelian, probably in allusion to its reddish colour (carneus, “flesh-coloured”). Some cornelian, however, is brown, yellow or even white. Certain kinds of brown and bright red chalcedony, much resembling cornelian, pass under the name of sard (q.v.). The Hebrew *odem* was probably a red stone, either cornelian, sard or jasper. All cornelian is translucent and is thus distinguished from jasper of similar colour, which is always opaque. The red colour of typical cornelian is due to the presence of ferric oxide. This is often developed artificially by exposure to sunshine, or to artificial heat, whereby any ferric hydrate in the stone becomes more or less dehydrated; or the stone is treated with a solution of an iron salt, like ferrous sulphate, and then heated, when ferric oxide is formed in the pores of the stone. An opaque white surface is sometimes produced artificially on a red cornelian: this is said to be done by coating the stone with carbonate of soda and then placing it on a red-hot iron; or by using a mixture of iron oxide and vinegar, which contains certain vegetable juices and heating it on charcoal. Inscriptions and figures in white on red cornelian (“burnt cornelian”) are well known from the East. Much cornelian comes from India, being mostly derived from agate-gravels, resulting from the disintegration of the Deccan traps, in the neighbourhood of Ratanpur, near Broach. A good deal of the cornelian now sold, however, is Brazilian agate, artificially stained. (See *Agate*.)

CARNESCECCHI, PIETRO (1508–1567), Italian humanist, was the son of a Florentine merchant, who under the patronage of the Medici, and especially of Giovanni de’ Medici as Pope Clement VII., rapidly rose to high office at the papal court. He came into touch with the new learning at the house of his maternal uncle, Cardinal Bernardo Dovizzi, in Rome. At the age of twenty-five he held several rich livings, had been notary and protonotary to the Curia, and was first secretary to the pope, in which capacity he conducted the correspondence with the nuncios (among them Pier Paolo Bergerio in Germany) and a host of other duties. By his conduct at the conference with Francis I. at Marseilles he won the favour of Catherine de’ Medici and other influential personages at the French court, who in later days befriended him. He made the acquaintance of the Spanish reformer Juan de Valdes at Rome, and got to know him as a theologian at Naples, being especially drawn to him through the appreciation expressed by Bernardino Ochino, and through their mutual friendship with the Lady Julia Gonzaga, whose spiritual adviser he became after the death of Valdes. He became a leading spirit in the literary and religious circle that gathered round Valdes in Naples, and that aimed at effecting from within the spiritual reformation of the church. Under Valdes’ influence he whole-heartedly accepted Luther’s doctrine of justification by faith, though he repudiated a policy of schism.

When the movement of suppression began, Carnesecchi was implicated. For a time he found shelter with his friends in Paris, and from 1552 he was in Venice leading the party of reform in that city. In 1557 he was cited (for the second time) before the tribunal in Rome, but refused to appear. The death of Paul IV. and the accession of Pius IV. in 1559 made his position easier, and he came to live in Rome. With the accession of Pius V. (Michael Ghislieri) in 1565 the Inquisition renewed its activities with fiercer zeal than ever. Carnesecchi was in Venice when the news reached him, and betook himself to Florence, where, thinking himself safe, he was betrayed by Cosimo, the duke, who wished to curry favour with the pope. From July 1566 he lay in prison over a year. On the 21st of September 1567 sentence of degradation and death was passed on him and sixteen others, ambassadors from Florence vainly kneeling to the pope for some mitigation, and on the 1st of October he was publicly beheaded and then burned.

CARNIOLA (Ger. *Krain*), a duchy and crown-land of Austria, bounded N. by Carinthia, N.E. by Styria, S.E. and S. by Croatia, and W. by Görz and Gradisca, Trieste and Istria. It has an area of 3856 sq. m. Carniola is for the most part a mountainous region, occupied in the N. by the Alps, and in the S. by the Karn. (q.v.) and Carnio-Montan. The Julian Alps, the Karawanks and the Steiner Alps, which belong all to the southern zone of the Eastern Alps. The highest point in the Julian Alps is formed by the three sugar-loaf peaks of the Triglav or Terglou (9304 ft.), which offers one of the finest views in the whole of the Alps, and which bears on its northern declivity the only glacier in the province. The Triglav is the dividing range between the Alps and the Karst Mountains, and its huge mass also forms the barrier between three races: the German, the Slavonic and the Italian. Other high peaks are the Mangart (8784 ft.) and the Julau (8708 ft.). The Karawanks, which form the boundary between Carinthia and Carniola, have as their highest peak the Stoub or Stuhlbberg (7344 ft.), and are traversed by the Loibl Pass (4492 ft.). They are continued by the Steiner or Santhaler Alps, which have as their highest peak the Grintouz or Grinztovc (8393 ft.). This peak is situated on the threefold boundary of Carinthia, Carniola and Styria, and affords a magnificent view of the whole Alpine neighbouring region.

Among the principal mountains is that of the Carnio-Montan, which is occupied by the following divisions of the northern ramifications of the Karst Mountains: the Birnbaumcr Wld with the highest peak, the Nanos (4275 ft.), and the Krainer Schneeberg (5800 ft.); the Hornwald with the highest peak, the Hornhüch (3608 ft.), and the Usokengebirge (3874 ft.). The portion of Carniola belonging to the Karst region presents a great number of caves, subterranean streams, funnels and similar phenomena. Amongst the best-known are the grottos of Adelsberg, the larger ones of, Planina and the Kreuzberghöhe near Laas.

With the exception of the Idriva and the Wippach, which as tributaries of the Isonzo belong to the basin of the Adriatic, Carniola belongs to the watershed of the Save. The Save or Sava rises within the duchy, and is formed by the junction at Radmannsdorf of its two head-streams the Wurzener Save and the Wocheiner Save. Its principal affluents are the Kainer and the Steiner Feistritz on the left, and the Zeyer or Sora, the Laibach and the Gurk on the right. The most remarkable of these rivers is the Laibach, which rises in the Karst region under the name of Poik, takes afterwards a subterranean course and traverses the Adelsberg grotto, and appears again on the surface near Planina under the name of Unz. Shortly after this it takes for the second time a subterranean course, to appear finally on the surface near Oberlaibach. The small torrent of Rothwein, which flows into the Wurzener Save, forms near Veldes the splendid series of cascades known as the Rothwein Fall. Amongst the principal lakes are the Wochein, the Weissensfel, the Veldes, and the seven small lakes of the Triglav; while in the Karst region lies the famous periodical lake of Zirknitz, known to the Romans as *Locus Lucens* or *Lucea Palus*.

The climate is rather severe, and the southern part is exposed to the cold north-eastern wind, known as the Bora. The mean
annual temperature at Laibach is 48° F., and the rainfall amounts to 72 ins. Of the total area only 14-8% is under cultivation, and the crops do not suffice for the needs of the province; forests occupy 44-4%, 17-2% are meadows, 15-7% are pastures, and 1-1% of the soil is covered by vineyards. Large quantities of flax are grown, while the timber trade is of considerable importance. Fish and game are plentiful, and the silk worm is bred in the warmer districts. The principal mining product is mercury, extracted at Idria, while iron and copper ore, zinc and coal are also found. The industry is not well developed, but the weaving of linen and lace is pursued as a household industry.

Carniola had in 1900 a population of 508,348, which corresponds to 132 inhabitants per sq. m. Nearly 95% were Slovenes and 5% Germans, while 99% of the population belonged to the Roman Catholic Church. The local diet, of which the bishop of Laibach is a member ex officio, is composed of thirty-seven members, and Carniola sends eleven deputies to the Reichsrat at Vienna. For administrative purposes the province is divided into eleven districts and one autonomous municipality, Laibach (pop. 36,547), the capital. Other important places are Oberlaibach (5773), Gurkfeld (5294), Zirknitz (5660), Adelsberg (5616), Neumarkt (2626), Kainburg (2484) and Gottschee (2421).

Carniola derives its modern name from the Slavonic word *Krajina* (frontier). During the Roman Empire it formed part of Noricum and Pannonia. The Slavonic population settled here during the end of the 6th and the beginning of the 7th century. Conquered by Charlemagne, the most of the district was bestowed on the duke of Friuli; but in the 10th century the title of margrave of Carniola began to be borne by a family resident in the castle of Kieselberg near Krainburg. Various parts of the present territory were, however, held by other lords, such as the duke of Carinthia and the bishop of Freising. Towards the close of the 14th century all the separate portions had come by inheritance or bequest into the hands of Rudolph IV. of Austria, who took the title of duke of Carniola; and since then the duchy has remained a part of the Austrian possessions, except during the short period from 1809 to 1813, when it was incorporated with the French Illyrian Provinces. In 1849 it became a separate crown land.

See Dimitz, Geschichte Kains von der ältesten Zeit bis 1813 (4 vols., Laibach, 1874-1876).

**CARNIVAL** (Med. Lat. carnevorium, from caro, carnis, flesh, and levere, to lighten or put aside; the derivation from volere, to say farewell, is unsupported), the last three days preceding Lent, which in Roman Catholic countries are given up to feasting and merry-making. Anciently the carnival was held to begin on twelfth night (6th January) and last till midnight of Shrove Tuesday. There is little doubt that this period of licence represents a compromise which the church always inclined to make with the pagan festivals and that the carnival really represents the Roman Saturnalia. Rome has ever been the headquarters of carnival, and though some popes, notably Clement IX. and XI. and Benedict XIII., made efforts to stem the tide of Bacchanalian revelry, many of the popes were great patrons and promoters of carnival keeping. Paul II. fashioned in this spirit. In his time the Jews of Rome were compelled to pay yearly a sum of 1130 golden florins (the thirty being added as a special memorial of Judas and the thirty pieces of silver), which was expended on the carnival. A decree of Paul II., minutely providing for the diversions, orders that four rings of silver gilt should be provided, two in the Piazza Navona and two at the Monte Testaccio—one at each place for the burghers and the other for the retainers of the nobles to practise riding at the ring. The pope also orders a great variety of races, the expenses of which are to be paid from the papal exchequer—one to be run by the Jews, another for Christian children, another for Christian young men, another for sexagenarians, a fifth for asses, and a sixth for buffaloes. Under Julius III. we have long accounts of bull-hunts—or rather bull-baits—in the Forum, with gorgeous descriptions of the magnificence of the dresses, and enormous suppers in the palace of the Conservatori in the capitol, where seven cardinals, together with the duke Orazio Farnese, supped at one table, and all the ladies by themselves at another. After the supper the whole party went into the courtyard of the palace, which was turned into the semblance of a theatre, "to see a most charming comedy which was admirably played, and lasted so long that it was not over till ten o'clock!" Even the austere and rigid Paul IV. (ab. 1559) used to keep carnival by inviting all the Sacred College to dine with him. Sixtus V., who was elected in 1585, set himself to the keeping of carnival after a different fashion. Determined to repress the lawlessness and crime incident to the period, he set up gibbets in conspicuous places, as well as whipping-posts, the former as a hint to robbers and cut-throats, the latter to store for minor offenders. We find, further, from the provisions made at the time, that Sixtus reformed the evil custom of throwing dirt and dust and flour at passengers, permitting only flowers or sweetmeats to be thrown.

The later popes for the most part restricted the public festivities of the carnival to the last six or seven days immediately preceding Ash Wednesday. The municipal authorities of the cities, on the other hand, regulated much such as Shrove Tuesday, or mardi gras. In Russia, where no Ash Wednesday is observed, carnival galetis last a week from Sunday to Sunday.

**CARNIVORA**, the zoological order typified by the larger carnivorous placental land mammals of the present day, such as lions, tigers and wolves, but also including species like bears whose diet is largely vegetable, as well as a number of smaller flesh-eating species, together with the seals and their relatives, and an extinct Tertiary group. Apart from this distinct group (see CREODONTA), the Carnivora are characterized by the following features. They are Unguiculate, or clawed mammals, with never less than four toes to each foot, of which the first is never opposable to the rest; the claws, or nails, being more or less pointed although occasionally rudimentary. The teeth comprise a deciduous and a permanent series, all being rooted, and the latter divisible into the usual four series. In front there is a series of small pointed incisors, usually three in number, on each side of both jaws, of which the first is always the smallest and the third the largest, the difference being most marked in the upper jaw; these are followed by strong conical, pointed, recurved canines; the premolars and molars are variable, but generally, especially in the anterior part of the series, more or less compressed, pointed and trenched: if the crowns are flat and tuberculated, they are never complex or divided into lobes by deep inflexions of enamel. The condyle of the lower jaw is a transversely placed half-cylinder working in a deep gneissic fossa of corresponding form. The brain varies much in size and form, but the hemispheres are never destitute of convolutions. The stomach is always simple and pyriform; the caecum is either absent or short and simple; and the colon is not succolated or much wider than the small intestine. Vesicular seminales are never developed, but Cowper's glands may be present or absent. The uterus is two-horned, and the teats are abdominal and variable in number; while the placenta is deciduate, and almost always zonary. The clavicle is often absent, and when present never complete. The radius and ulna are distinct; the scapohoid and lunar of the tarsus are united.
there is never an os centrale in the adult; and the fibula is distinct.

The large majority of the species subsist chiefly on animal food, though many are omnivorous, and a few chiefly vegetable-eaters. The more typical forms live altogether on recently-killed warm-blooded animals, and their whole organization is thoroughly adapted to a predaceous mode of life. In conformity with this manner of obtaining their subsistence, they are generally bold and savage in disposition, though some are capable of being domesticated, and when placed under favourable circumstances exhibit a high degree of intelligence.

I. FISSIPEDIA

The typical section of the group, the Carnivora Vera, Fissipedia or Carnassidentia, includes all the existing terrestrial members of the order, together with the otters and sea-otters. In this section the fore-limbs never have the first digit, or the hind-limbs the first and fifth digits, longer than the others; and the incisors are \( \frac{3}{4} \) on each side, with very rare exceptions. The cerebral hemispheres are more or less elongated; always with three or four convolutions on the outer surface forming arches above each other, the lowest surrounding the Sylvian fissure. In the cheek-series there is one specially modified tooth in each jaw, to which the name of "sectorial" or "carnassial" is applied. The teeth in front of this are more or less sharpened and compressed; the teeth behind broad and tuberculated. The characters of the sectorial teeth deserve special attention, as, though fundamentally the same throughout the group, they are greatly modified in different genera. The upper sectorial is the most posterior of the teeth which have predecessors, and is therefore reckoned as the last premolar (2, 4 of the typical dentition). It consists of a more or less compressed blade supported on two roots and an inner lobe supported by a distinct root (see fig. 1). The blade when fully developed has three cusps (1, 2 and 3), but the anterior is always small, and often absent. The middle cusp is conical, high and pointed; the tubercle being absent or rudimentary. In Mepes (V) and Ursus (VI) the heel is greatly developed, broad and tuberculated. The blade in these cases is generally placed obliquely, its flat or convex (outer) side looking forwards, so that the two lobes or cusps are almost side by side, instead of anterior and posterior. The inner tubercle (3) is generally a conical pointed cusp, placed to the inner side of the hinder lobe of the blade. The special characters of these teeth are more disguised in the sea-otto than in any other species, but even here they can be traced.

The toes are nearly always armed with long, strong, curved and sharp claws, ensheathing the terminal phalanges and held firmly in place by broad plates of bone reflected over their attached ends from the bases of the phalanges. In the Felidae these claws are "retractile"; the terminal phalange with the claw attached, folding back in the fore-foot into a sheath by the outer or unlar side of the middle phalange of the digit, and retained in this position when at rest by a strong elastic ligament. In the hind-foot the terminal joint of the phalanges is retracted on to the top, and not the side of the middle phalange. By the action of the deep flexor muscles the terminal phalanges are straightened, the claws protruded from their sheath, and the soft "velvety" paw becomes suddenly converted into a formidable weapon of offence. The habitual retraction of the claws preserves their points from wear.

The land Carnivora are best divided into two subgroups or sections—(A) the Aeluroidia, or Herpestoidia, and (B) the Arctoidea; the recognition of a third section, Cynoidea, being rendered untenable by the evidence of extinct forms.

(A) Aeluroidia.—In this section, which comprises the cats (Felidae), civets (Viverridae) and hyenas (Hyaenidae), the tympanic bone is more or less ring-like, and forms only a part of the outer wall of the tympanic cavity; an inflated alvisphenoid bulla is developed; and the external auditory meatus is short. In the nasal chamber the maxillo-turbinal is small and doubly folded, and does not cut off the naso-turbinal and adjacent bones from the nasal aperture. The carotid canal in the skull is short or absent. Cowper's glands are present, as is a prostate gland and a cecum, as well as a duodenal-jejunal flexure in the intestine, but an os penis is either wanting or small.

The members of the cat tribe, or Felidae, are collectively characterized by the following features. An alvisphenoid is lacking on the lower aspect of the skull. In existing forms the usual dental formula is \( 1, 2, 1, 3, 4, 0 \); the upper molar being rudimentary and placed on the inner side of the carnassial, but the first premolar may be absent, while, as an abnormality, there may be a small second lower molar, which is constantly present in

---

**Fig. 2.—Left lower sectorial or carnassial teeth of Carnivora.**

I, Felis; II, Canis; III, Ursus; IV, Macra; V, Meles; VI, Ursus. 1, Anterior cusp of blade; 2, posterior cusp of blade; 3, inner tubercle; 4, heel. It will be seen that the relative size of the two roots varies according to the development of the portion of the crown they respectively support.

---

The land Carnivora are best divided into two subgroups or sections—(A) the Aeluroidia, or Herpestoidia, and (B) the Arctoidea; the recognition of a third section, Cynoidea, being rendered untenable by the evidence of extinct forms.

(A) Aeluroidia.—In this section, which comprises the cats (Felidae), civets (Viverridae) and hyenas (Hyaenidae), the tympanic bone is more or less ring-like, and forms only a part of the outer wall of the tympanic cavity; an inflated alvisphenoid bulla is developed; and the external auditory meatus is short. In existing forms the usual dental formula is \( 1, 2, 1, 3, 4, 0 \); the upper molar being rudimentary and placed on the inner side of the carnassial, but the first premolar may be absent, while, as an abnormality, there may be a small second lower molar, which is constantly present in
CARNIVORA

some of the extinct forms. The auditory bulla and the tympanic are divided by an internal partition. The parotid process is separate from, or only extends to a slight degree upon the auditory bulla. The thoracic vertebrae number 13; the feet are digitigrade, with five toes, with a small inner heel on the floor and an outer heel, and the metatarsus is haired all round. Anal glands are present.

As regards the teeth, when considered in more detail, the incisors are small, and the canines large, strongly recurved, with transverse roots, and with an upper tooth behind the canine. The premolars are compressed and sharp-pointed; the most posterior in the upper jaw (the sectorial) being a large tooth, consisting of a compressed blade, divided into three unequal cusps supported by two roots, with a small inner heel on the floor and an outer heel, and by a distinct root (fig. 1). The upper molar is a small tuberulare tooth placed more or less transversely at the inner side of the hinder part of the back or slightly forward. The lower jaw the molar (sectorial) is reduced to the last pair of two subequal lobes (fig. 2). Occasionally it has a rudimentary heel, but never an inner tubercle. The skull generally is short and rounded, though proportionally more elongated in the larger forms; with the facial portion short and broad, and the zygomatic arches wide and strong. The auditory bullae are large, rounded and smooth. Vertebræ: C. 7, D. 13, L. 7, S. 3, Cat. 13-29. Clavicles better developed than in other Carnivora, but not articulating with either the shoulder-bones or sternum. Of the five front toes, the third and fourth are nearly equal and longest, the second slightly, and the fifth considerably shorter. The first is still shorter, not reaching the metacarpophalangeal articulation of the second. In the hind-feet the metatarsal bones are the same as in the other Carnivora, and are equally divided what shorter and nearly equal, while the first is represented only by the rudimentary metatarsal bone. The claws are large, strongly curved, compressed, very sharp, and exhibit the retractile condition in the hind-feet; but the tail is quite naked with the exception of a few small hairs. The same species a mere stump, in others nearly as long as the body. The ears are of moderate size, more or less triangular and pointed; and the eyes rather large, with the iris mobile, and with a pupillary aperture which can be thrown under by a light C. to a narrow vertical slit, in others to an oval, and in some to a circular aperture. The tongue is thickly covered with short, pointed, recurved horn-papillae; and the caecum is small and simple.

Carnivores, the canines are the most specialized of all Carnivora, although they exhibit many features connecting them with extinct types. All the members of the group feed almost exclusively on warm-blooded animals which they have the teeth and structure adapted to seize, kill, and tear, by means of the claws being smaller, less curved and less completely retractile, owing to the feebler development of the elastic ligaments. The skull is short and high, with the frontal region broad and elevated 4 and 5, the eye-sockets are far back, of the long, and the ears large, round, the body light, the limbs tall and long, and the colour pale yellowish-brown with small solid black spots (see Cheeta). The family Viverridae, which includes the civet-cats, genets and marbled cats, is closely related to Felidae, but some members have a fuller dentition, and exhibit certain other structural differences from the cats, to the largest of which they may make no approach in the matter of bodily size. As a rule, there is an alisphenoid canal; the cheek-dentition is p. 3 or 4. m. 1 or 2. The bulla is small and the tympanic large, with a low division between them; and the parotid process is leaf-like and spread over the bulla. The number of dorsal vertebrae, except in the aberrant Proteles, is 13 or 14; the claws may be either completely or partially retractile or non-retractile; generally the right has five toes, but there may be four in front; and the reverse of this, or only four on each foot; the gait may be either digitigrade or partially plantigrade; and the metatarsus may be either hairy or naked inferiorly. Anal, and in some cases also the tail are sometimes absent. The family is limited to the warmer parts of the Old World.

Considerable difference of opinion prevails with regard to the serial position of the fossa, or fossa (Cryptoprocta ferox), of Madagascar, who has been regarded as the sole representative of a special subfamily—Cryptoproctinae—of the Viverridae. The subfamily and genus are characterized by possessing a total of 36 teeth, arranged as 1. 5. 3. 4. 2. 5. 1. The teeth generally closely resemble those of the Felidae, and the carnassial of both jaws being very minute and early deciduous: the upper canine is small, the inner lobe, quite at the anterior part; the molar is small and placed transversely; and the lower sectorial has a long trentthic bilobed crown, and a long, thin, narrow, distal surface of the crown, but no inner tubercole. The skull is generally like that of Felis, but proportionally longer and narrower with the orbit widely open behind. Vertebræ: C. 7, D. 13, L. 7, S. 3. Cat. 29. Body elongated. Limbs moderate in size. Feet subplantigrade, with five well-developed toes on each, carrying sharp, compressed, retractile claws. Ears moderate. Tail long and

---

...
The more typical members of the group, constituting the subfamily *Viverininae*, are characterized by their sharp, curved and largely retractile canines, the presence of five toes to each foot, and of being more or less palm-civets. Spots are the chief type of marking. The vertebrae number C, 7; D, 13; L, 7; S, 3; Ca. 29-36. Numerous relatively large species comprise the family, and includes the following genera: *Tictol*, representing the genus *Tictol*, is known. Bulls are situated under the surface of the head, and are usually naked. It is a uniformly-colored creature of medium size. The tail is pointed at the ends, and the rest of the body is covered with naked plumes. Apparently *Tictol* goudoti, of Madagascar, which has been generally classed in the *Herpestinae*, is a nearly related animal, characterized by the reduction of its dentition, due to insectivorous habits (fig. 3); the canines being small, the anterior molar formula is 4. 4. 2. 3. and the molars molariform. It is a uniformly-colored creature of medium size.

Asia and Africa, and while many of the species, like the Egyptian *H. ichneumon* and the ordinary Indian mongoose, *H. mungo*, are pepper-and-salt coloured, the large African *H. albicauda* has the terminal two-thirds of the tail clothed with long white hairs (see *Ictitherium*).

The following distinct African and Malagasy generic representatives of the subfamily are recognized, viz. *Halogale*, with 3 premolars, and containing the small South African *H. parvula* and a variety of the *Halogale cristata* and with allied tropical African species differ from *Herpestes* in having only four toes on each foot. The orbit is nearly complete, and the tail of moderate length and rather bushy. In *Cynictis*, which has the orbit completely closed, there are both fore and four hind toes; and the skull is shorter and rather broader than in *Herpestes*, rather contracted behind the orbits, the face short, and the anterior chamber of the auditory bulla very large. The front claws are elongated. Includes only *C. plicatilis* from South Africa.

All the foregoing herpestines have the nose short, with its under surface flat, bald, and with a median longitudinal groove. The remaining forms have the nose more or less produced, with its under side convex, and a space between the nostrils and the upper lip (true philtrum) present. The upper lip, including the nasal extremity, is divided into two sections, to which some zoologists assign generic rank. In the Recent species the of the maxilla. Ictitherium, the skull of the subgenus *Crocuta*, the upper molar is extremely small, 2- or one-rooted, often deciduous; the lower molar without trace of inner tubercle, and with an extremely small heel. Ears moderate, rounded. Hair not aggregated to a mane. The species of the tribe *Hemigalidae* (*Hemigalea* and *Hemigalius*) resemble those of the former species in some respects intermediate between the cat and the dog, and are generally considered to be in some degree intermixed. The species of the tribe *Aard-Wolf* is well known to be the most perfect of all canidae, as it is considered to be the most specialized form, as it is certainly in its visceral anatomy, especially in that of the reproductive organs of the female.

The striated hyena of northern and eastern Africa and southern Asia; and *H. brunnea* of South Africa, in some respects intermediate between the common and the next section. In the latter the skull of the subgenus *Crocuta*, the upper molar is extremely small, 2- or one-rooted, often deciduous; the lower molar without trace of inner tubercle, and with an extremely small heel. Ears moderate, rounded. Hair not aggregated to a mane. The species of the tribe *Hemigalidae* (*Hemigalea* and *Hemigalius*) resemble those of the former species in some respects intermediate between the cat and the dog, and are generally considered to be in some degree intermixed. placed at the hinder margin of the posterior lobe of the blade, and a broad, low, tuberculated heel, occupying about one-third of the whole length of the tooth. The second molar is less than half the length of the first, with a pair of cusps placed side by side anteriorly, and a less distinct posterior pair. The third is an extremely small and simple tooth with a subcircular tuberculated crown and single root.

Views differ in regard to the best classification of the Canidae, some writers adopting a number of generic groups, while others consider that very few meet the needs of the case. In retaining the old genus Canis in the wide sense, that is to say, inclusive of the foxes, Professor Max Weber is followed. The best cranial character by which the different species of the family may be distinguished is that in dogs, wolves and jackals the post-orbital process of the frontal bone is regularly smooth and convex above, with its extremity bent downwards, whereas in foxes the process is hollowed above, with its outer margin (particularly in the frontal and the anterior part of the cranial cavity, and the absence of such sinuses in the latter. The pupil of the eye when contracted is round in most members of the first group, and vertically elliptical in the others, but more observations are required before this character can be absolutely relied upon. The form and length of the tail is often used for the purposes of classification, but its characters do not coincide

obscurely. Some naturalists believe it to be a distinct species, descended from one that no longer exists in a wild state; others have sought to find its progenitors in some one of the wild or half-wild races, either of true dogs, wolves or jackals; while others again believe that it is a new species which has been developed by selective breeding.

Fig. 5.—The African Hunting-Dog (Lycaon pictus), with those of the cranium, as many of the South American Canidae have the long bushy tails of foxes and the skulls of wolves.

The more abundant representative of the thiodis group is the hunting-dog (Lycaon pictus, fig. 5), which differs from the other members of this series by the teeth being rather more massive and rounded, the skull shorter and broader, and the presence of but four teeth on each side (in Canis, 10). The shape of the lower jaw in this group is not so wide as in Canis. The other species of the genus, such as the African bush-dog (Lycaon pictus), are smaller and have fewer teeth. The American hunting-dog (Lycalopex culpoe) is a smaller and more slender species, with a shorter and broader skull, and a different type of ear. The European hunting-dog (Vulpes vulpes), is characterized by the presence of a large air-sinus in the forehead, which does not affect the external organs of the nose, and by the breadth of the anterior part of the cranial cavity, and the absence of such sinuses in the latter. The pupil of the eye when contracted is round in most members of the first group, and vertically elliptical in the others, but more observations are required before this character can be absolutely relied upon. The form and length of the tail is often used for the purposes of classification, but its characters do not coincide

CARNIVORA

rule. Palaeontology has, however, made great strides since 1880, and the idea that the earlier mammals had more teeth than their descendants has not only received no confirmation, but has been practically disproved. Consequently Miss Alberta Carlsson had a comparatively easy task in 1923 in a paper in the "Jahrbuch" for 1905 in demonstrating that the long-eared fox is a specialized, and to some extent degraded, form rather than a primitive type. This, however, is not all, for the lady points out, that as in other primates present and past, as is really the descendant of the fossil *Canis cuvieuxi* of northern India. This is a circumstance of considerable interest from a distributional point of view, as affording one more instance of the intimate relationship between the early mammalian fauna of India and the existing mammals of Africa.

In regard to the members of the dog-tribe as a whole, it may be stated that they are generally sociable animals, hunting their prey in packs. Many species burrow in the ground; none habitually clime trees. One of the carnary species, feeding largely on animals, they have chased and killed themselves, many, especially among the smaller species, eat garbage, carrion, insects, and also fruit, berries and other vegetable substances. The upper surface of the tail of the fox and other species is practically bare, and with considerable amount of hair, and often forming dark bars on the buttocks. The dark spot on the back of the tail is particularly conspicuous, notably in such widely separated species as the wolves, Azara's dog and the fennec.

Although the existing very different characters in the family *Ursidae*, as will be more fully mentioned in the sequel, was in past times intimately connected with the *Canidae*.

**Bear tribe.**

In common with the next two families, the modern characters are complex, small true canine teeth, and the broad paroccipital process, which is, however, independent of the bulla. The feet are more or less completely planigrade and five-toed. The intestine has neither duodenal jejunal flexure nor a caecum, and is rudimentary; but glands are present in the vasa deferentia; and the pelvis bone is cylindrical. As distinctive characteristics of the *Ursidae*, may be mentioned the presence of an alisphenoid canal on the base of the skull; the general absence of a perforation on the inner side of the lower end of the paroccipital process; the presence of upper incisors, the small size of the canine tooth, and the absence of lower molars, which are mostly elongated and low-cusped; and the non-cutting character and fore-and-aft shortening of the upper sectorial, which has no inner root and one inner cusp (fig. 1, III.).

The canine teeth are large, the so-called upper incisors are completely planigrade feet and clumsy gait are features eminently characteristic of the bears. The great majority of existing bears may be included in the type *Ursus arctos*, in this wide sense, the leading characteristics being as follows: the dentition is 4, 1, 3, 2, 1, 3, 2, 1, 4, 3, 2; but the three anterior premolars, above and below, are one-rooted, rudimentary and frequently wanting. Usually the first (placed close to the canine) is considerably larger than the second and third, which is situated close to the other teeth of the cheek-series. The fourth (upper sectorial) differs essentially from the corresponding tooth of other Carnivora in that the inner lobe is not supported by a distinct root, nor has the second root, which is very slight, the crown of both true molars are longer than bread, with flattened, tuberculated, grinding surfaces; the second having a large backward prolongation or heel. The lower sectorial has a small and indistinct blade and groove. The jaw of the Himalayan *U. talmissus* is of the same length, but with a broader and more flattened tubercular crown; while the third is smaller. The milk-teeth are comparatively small, and shed at an early age. The skull is more or less elongated, with the orbits hollow and incomplete behind, and the posterior part of the brain-case behind the foramen ovale of the auditory bulla, and where the post-temporal is absent. The external surangular is rather small, thin, and irregular in shape.

The typical group of the genus is represented by the brown bear (*U. arctos*) of Europe and Asia, of which there are many local races, such as the *black* (*U. b. fuscus*), the *Himalayan* (*U. t. talmissus*), the North Asiatic *U. a. collaris*, and the nearly allied Kamchadale race, which is of great size. In Alaska the group is represented by huge bears, which can scarcely claim specific distinctiveness from *U. arctos*; and if these are ranked only as races, it is practically impossible to regard the Rocky Mountain grizzly bear (*U. horribilis*) as of higher rank, although it naturally differs more from the Asiatic animal. On the other hand, the small and light-colored *U. pruinosus* of Tibet may be allowed specific rank. A more distant is the North American black bear *U. americanus*, and its white relative *U. kermodei* of British Columbia; and perhaps we should affiliate to this group the Himalayan and Japanese black bears (*U. tauricus* and *U. japonicus*). Very distinct is the small Malay sun-bear (*U. helarctos*) malayanus, characterized by its short, smooth fur, extensile tongue, short and wide head, and broad molars. Finally, the spectacled bear of the Andes, *U. (Tremarctos) ornatus*, which is also a broad-skulled black species, differs from all the rest in having a perforation, or foramen, on the inner side of the lower end of the humerus. A second genus, *Melursus*, represented by the Indian sloth-bear (*M. ursinus*), differs from the preceding in having only one pair of upper incisors, the small size of the canine tooth, and the extremely long, sharp, white, double, and the chief food of this shaggy black species—a diet which accounts for its feeble dentition (see *Bear*).

**The giant panda (Aeluropus melanoleucus, fig. 6)** of eastern Tibet and north-west China forms in some degree a connecting link between the bears and the true panda, although placed by Professor E. R. Lankester in the same family as the latter. In the number of the teeth, and to some extent in the character of the molars, as well as in the abbreviated tail, *Aeluropus* resembles the bears, but in the structure of the sectorial tooth, the presence of an extra radial carpal bone, and the osteology generally, it is more like the panda. In the absence of an alisphenoid canal to the skull it differs both from the latter and the bears, and thereby resembles the raccoons; while in having a perforation at the lower end of the humerus, it agrees with the spectacled bear, the panda and dog; the position is *i*, *j*, *p*, *m*, the first premolars increasing in size from first to last, and two-rooted except the first; the first upper molar with quadrato cuneus, broader than long; and the second larger than the first. Skull with the zygomatic arches and sagittal crest immensely developed, ascending branch of upper jaw very high, giving great extent for attachment of temporal muscle, and facial portion short. Bony palate not extending behind the last molar. No alisphenoid canal. Feet bear-like, but soles more hairy, and perhaps less completely plantigrade. This is a long and thick, and tail extremely short. Humerus with a perforation on the inner side of the lower end; a very large extra radial carpal bone. The colour of this strange animal is black and white (fig. 6).

The panda (*Aeluropus fujens*) we reach an undoubted representative of the Procyonidae, or raccoon tribe, differing, however, from all the rest except the doubtful *Aeluropus*, in its Asiatic habitat. If the latter be included, the family may be defined as follows. Molars 1, 4, 5, 3, except *Aeluropus*, which has in the此案 the six cusps, except in *Aeluropus*, long and generally ringed.

**The giant panda (Aeluropus melanoleucus).**
CARNIVORA

ringed. Fur long and thick. Extra radial carpal bone moderate. The puma is a bright golden red animal, with black under-parts, ranging from the eastern Himalaya to north-western China, where it is represented by a distinct race. Fossil species occur in the later Tertiary in the eastern United States. The raccoons (Procyon) are the first and typical representatives of the American section of the family, in which an allisphenoid canal is always wanting. In this genus the dentition is i. 4 c. 1 p. 3 m. 3: total 38: the upper molars are broad, but the lower molars small and no inner tubercle. The dentition of the racoon is 6. 4. 2. 3. 1: total 34: the upper molars are broad, but the lower molars small and no inner tubercle. The dentition of the marten is 5. 4. 2. 3. 1: total 34: the upper molars are broad, but the lower molars small and no inner tubercle. The dentition of the marten is 6. 4. 2. 3. 1: total 34: the upper molars are broad, but the lower molars small and no inner tubercle.

In the order Carnivora, the teeth of the forefoot are typically modified for seizing and gripping prey, while those of the hind foot are primarily adapted for running and hopping. The family Mustelidae, which includes weasels, skunks, and minks, is noted for its diverse habitats and ecological roles, ranging from forested areas to grasslands and even barren deserts. The order is significant for its contribution to the biodiversity of ecosystems, serving as apex predators and playing key roles in nutrient cycling and seed dispersal. The biological and ecological importance of the order Carnivora underscores the need for conservation efforts to protect these species and their habitats. 

The family Mustelidae is divided into several subfamilies, each with distinct characteristics and adaptations. The Mustelinae, for example, is a subfamily that includes species such as the mink, weasel, and ferret. These species are known for their agile behavior and diverse diets, ranging from insects and small vertebrates to fruits and seeds. Their adaptation to various habitats, from cold Arctic regions to tropical forests, highlights the evolutionary flexibility and ecological significance of this family. The order Carnivora's contribution to the natural world is further exemplified by its role in controlling pest populations and maintaining ecological balance, serving as keystone species in many ecosystems.
larger than the sectorial, and in the more typical genera is much longer than broad.

In the North American skunks of the genus Mephitis the dentition is i. 1. c. 1. p. 1. m. 1; total 34. Upper molar larger than the sectorial; lower molar somewhat larger than the upper, with heel less than half the length of the whole tooth. Bony palate terminating posteriorly the hinder border of the last molar. Facial portion of skull short and somewhat truncated in front; zygomatic arches contiguous; teeth large, toothrow long. Body elongated. Limbs moderate, subplantigrade. Ears short and rounded. Tail long, abundantly clothed with long fine hair. Anal glands largely developed; their secretion, which can be discharged at the will, is highly offensive. When agitated they are thrown forward and rendered skunks proverbial. The South American species, which have only two upper premolars, and differ in some other characters, are generically separated under the name of Conepatus; while the smaller American arboreskunks are distinguished as Spilogale (see Skunk).

Passing on to the more typical members of the badger group, we have first the genus Arctonyx, with the dentition i. 1. c. 1. p. 1. m. 1; and where the incisor line is cleft, the other being placed posteriorly to the others: lower incisors inclined forwards. First premolars often rudimentary or absent; upper molar much larger than the sectorial, longer in the antero-posterior than in the transverse direction. The root of the upper molar is much larger than that of the incisor, and their very low, tuberculated heel. Skull elongated and depressed; face long, narrow, and concave above; bony palate extending as far back-wards as the level of the glenoid fossa; and palatal bones dilated. Suborbital foramina very large. Vertebrae: C. 7, D. 14-15, L. 6-5, S. 3, C. 23. Head pointed in front; snout produced, mobile, obliquely truncated, the nostrils being inferior. Limbs rather short and stout. Tail extremely short, but clothed with rather long hairy hair. Anal glands large and well developed; and emitting an odour like that of the skunks. One species, M. meliceps, the teledu, a small burrowing animal from the mountains of Java, at an elevation of 1000 or more ft. above the sea-level; and a second (M. m. javanica) in the Philippines.

In the true badger of the genus Meles the dentition is i. 1. c. 1. p. 1. m. 1; total 38. The first premolar in both jaws is extremely minute and often deciduous; while the upper molar is much larger than the sectorial; and the lower molar somewhat larger than the upper. Lower sectorial with a broad, low, tuberculated heel, more than half the length of the whole tooth. The postglenoidal process of the skull so strongly developed, and the glenoid fossa so deep, that the condyle of the lower jaw is carried back and is covered by the bony rim. Vertebrae: C. 7, D. 14-15, L. 6-5, S. 3, C. 12. Head pointed in front; snout produced, mobile, obliquely truncated, the nostrils being inferior. Limbs rather short and stout. Tail extremely short, but clothed with rather long hairy hair. Anal glands large and well developed, and emitting an odour like that of the skunks. One species, M. meliceps, the teledu, a small burrowing animal from the mountains of Java, at an elevation of 1000 or more ft. above the sea-level; and a second (M. m. javanica) in the Philippines.

In the nearly allied genus Taxidea the dental formula is as in Meles, except that the rudimentary anterior premolars appear to be always wanting in the upper jaw. The upper sectorial is much larger in proportion to the teeth than in Mephitis. The lower sectorial with a broad, low, tuberculated heel, more than half the length of the whole tooth. The postglenoidal process of the skull so strongly developed, and the glenoid fossa so deep, that the condyle of the lower jaw is carried back and is covered by the bony rim. Vertebrae: C. 7, D. 14-15, L. 6-5, S. 3, C. 12. Head pointed in front; snout produced, mobile, obliquely truncated, the nostrils being inferior. Limbs rather short and stout. Tail extremely short, but clothed with rather long hairy hair. Anal glands large and well developed, and emitting an odour like that of the skunks. One species, M. meliceps, the teledu, a small burrowing animal from the mountains of Java, at an elevation of 1000 or more ft. above the sea-level; and a second (M. m. javanica) in the Philippines.

In the true otter of the genus Lutra the dentition is i. 1. c. 1. p. 1. m. 1; total 36. Upper sectorial with a trenchant tricuspid blade, and a very large inner lobe, hallowed on the free surface, with a raised sharp edge, extending along two-thirds or more of the transverse diameter. Upper molar larger than the sectorial, broader than longer. Skull broad and depressed, contracted immediately behind the orbits; with the facial portion very short and the brain-case long. Vertebræ: C. 7, D. 14-15, L. 6-5, S. 3, C. 20-25. Tail long, thick at the base and tapering, rather depressed. Fur short and close.

Otters are more or less aquatic, living on the margins of rivers, lakes, and in some cases the sea; are expert divers and swimmers, and feed chiefly on fish. They have an extensive geographical range, and so much resemble each other in outward appearance, especially in the nearly uniform brown colouring, that in some cases the species are scarcely distinguishable—e.g., the American and European variety is a very large species from Brazil, Demerara and Surinam, with a prominent ridge along each lateral margin of the tail. In two small species the feet are only slightly webbed; claws exceedingly small or altogether wanting on some of the toes; the first upper premolar very small, sometimes wanting; and the molars very broad and massive. The species in question are L. annulatus of South Africa, and L. leptonyx or cinerea of India, Java and Sumatra, and have been separated as a distinct genus, Aonyx.

The sea-otter, Latou (or Enhydra) lutra, with the dentition i. 1. c. 1. p. 1. m. 1; total 32, differs from other Carnivora in having but two incisors on each side of the lower jaw, the one corresponding to the first (very small in the true otters) being absent. Though the molar of the sea-otter is large, rather flat, and more elongated, than is the case in the other species, the molars differ in the exceeding roundness and massiveness of their crowns and bluntness of their cusps. Feet webbed; fore-feet short, with five subequal toes, with short compressed claws; hind-feet very long, with five toes, of which four are webbed, and the fifth one, the longest and stoutest, the rest gradually diminishing in size to the first, all with moderate claws. Tail moderate, cylindrical (see Otter).

II. PINNIPEDIA

The second suborder is formed by the seals, walruses and eared seals, which differ from the rest of the Carnivora mainly in the limbs being modified for aquatic progress; the second and fourth digits being especially modified for swimming, and the general integument of the body, while the third, especially in the hind extremities, is elongated, expanded and webbed. There are always five well-developed digits on each limb. In the hind-limb the two marginal digits (first and fifth) are stouter and generally larger than the others. The teeth also differ from those of the more typical Carnivora. The incisors are always fewer than 4. The cheek series consists generally of four premolars and one molar of uniform characters, with never less than two roots, and with conical, more or less compressed, pointed crowns, which may have accessory cusps, placed before or behind the principal one, but are never broad and tuberculated. The milk-teeth are small, simple and shed or absorbed at an early age, usually either before or within a few days after birth. The brain is relatively large, the cerebral hemispheres broad in proportion to their length, and with numerous and complex convolutions. There is a very short caecum; the kidneys are divided into numerous distinct lobules. There are no clavicles. Tail always short. Eyes large and exposed, with flat cornea. The nostrils close by the elasticity of their walls, and are opened at will by muscular action.

The members of this group are aquatic, spending the greater part of their time in the water, swimming and diving with great facility, feeding mainly on fish, crustaceans and other marine animals, and progressing on land with difficulty, but always coming on shore for the purpose of bringing forth their young. They are generally marine, but occasionally ascend large rivers, and some inhabit inland seas and lakes, as the Caspian and Baikal. Though not numerous in species, they are widely distributed over the world, but occur most abundantly on the coasts of lands situated in cold and temperate zones.

As mentioned in the article Cetacea, the true seals (Phocidae), together with the walruses, may be directly descended from the primitive Credent Carnivora. The eared seals, on the other hand, show signs of affinity with the bears; but as they are of earlier geological age than the latter, they cannot be derived from that group.
The true seals (family Phocidae) are the most completely adapted for aquatic life of all the Pinipedia. When on land the hind-limbs are extended backwards and take no part in progression, which is effected by a series of jumping movements produced by the body muscles and the anterior members, or fore-limbs. The soles of the feet are hairy. There is no pinna to the ear, and no scrotum, the testes being abdominal. The upper incisors have simple, pointed crowns, and vary in number in the different species and families, but are all usually simple and pointed. The second and third gaps are the cusps. In some species of which the milk-dentition is known, there are three milk molars, which precede the second, third, and fourth permanent molars; the dentition is therefore $p$, $m$, $m$; the first premolar having as usual no milk predecessor. The third upper molar has no post-orbital process and no alisphenoid canal. The fur is stiff and adpressed, without woolly under-fur.

In the typical group, or subfamily Phocinae, the incisors are $i$, $c$, $p$, $m$, $m$. The second and third upper front teeth subequal, the first and fifth not greatly exceeding the others in length, the interdigital membrane not extending beyond them. In the genus Halichoerus the dentition is $i$, $c$, $p$, $m$, $m$; total 34. The second and third upper incisors are simple, pointed teeth, the crowns about equal in length. The species of this genus are widely distributed throughout the northern hemisphere, and include P. barbatus, the bearded seal; P. groenlandica, the Greenland seal; P. vitulina, the common seal; P. hispopus, the ribbon seal; P. crassidens, from the Caspian and Aral Seas; and P. sibirica, from Lake Baikal. (See Seal).

The members of the second subfamily, Monachinae, have incisors $i$, $c$, $p$, $m$, $m$. One species, M. leonina, has the first and fifth toes greatly exceeding the others in length, with nails rudimentary or absent. In the genus Monachus, the dentition is $i$, $c$, $p$, $m$, $m$; total 34. Crowns of molars strong, conical, compressed from above, and the incisors, of which the upper is the longer, subacute; the second and third upper incisors alike, the upper incisors of the second and third molars, and the lower incisors of the first and third molars, are subequal. The species of this genus are widely distributed throughout the northern hemisphere, and include P. barbatus, the bearded seal; P. groenlandica, the Greenland seal; P. vitulina, the common seal; P. hispopus, the ribbon seal; P. crassidens, from the Caspian and Aral Seas; and P. sibirica, from Lake Baikal. (See Seal).

In Phoca the dental formula is as in the last, but the teeth are somewhat more compressed, and the molars more globular. The length of the crown, as well as the breadth, of the incisors, is greater in each jaw. Crowns with accessory cusps. Vertebrum: C. 7, D. 15, L. 5, S. 5, S. 4. In the middle Atlantic, and 14. Includes only one species H. gymus, the grey seal of the coasts of Scandinavia and the British Isles.

In Phoca the dental formula is as in the last, but the teeth are somewhat more compressed, and the molars more globular. CARNOT, L. H.—CARNOT, L. N. M.

dressed and deprived of the longer harsh outer hairs, constitute the
"sealskin" of commerce. The species include O. stelleri, the
northern sea-lion, the largest of the genus, from the North Pacific,
about 10 ft. in length; O. jubata, the southern sea-lion, from the
eastern coast of South America, and O. tryon, the Steller's sea-lion,
O. urbina, the sea-bear or fur-seal of the North Pacific, the skins of
which are imported in immense numbers from the Pribiloff Islands;
O. antarctica or patula, from the Cape of Good Hope; and
O. forsteri, from Australia and various islands in the southern hemisphere.

Little is known as to the past history of the sea-lions and sea-
ears, but a skull has been obtained from the Miocene strata of Oregon,
which Mr F. W. True states to be considerably larger than any
existing sea-lion. The skull, however, is about 20 in. long, which
is probably only about 20 in. The name Pemoleon magnus has been
proposed for this fossil sea-lion, as the character of the skull and teeth
do not agree precisely with those of any living member of the group.
If, however, all the modern eared seals are included in the genus
Otaria, there is apparently no reason to exclude the fossil species.

**Extinct Carnivora**

Modern Carnivora are undoubtedly the descendants of the
Cretaceous (q.v.), an extinct early Tertiary suborder. It has been
observed that as the Miocene is approached, these Carnivora
become more numerous and the characters of the Carnivora Vera,
till at last it is difficult to determine where the one group ends and the other
commences. The creodont genera Stylophus and Promruera show some of
these modern characters, but with other characteristics of the Miocene
genus Amphisba, with the dental formula i, c., p., m., 2, 2, we that a type in which the fourth upper premolar and the first
lower molar assume the true sectorial character of the Carnivora Vera,
and the second upper molar is reduced in size. From the Amphisba the
descendants have been descended the Viverridae, the connecting genus being the African Nandina, which, as already
mentioned, retains the imperfectly ossified bulla of the ancestral form; from the latter, the Plesiocranidae, with a.
Lowe Plesiochis genus Lesitideres, has given rise to the Hyaenidae.

The Felidae have apparently an ancestral type in the creodont
Palaeocristis, which has been regarded as the direct ancestor of the
actual family. In these members, M. Lydekker (see above),
but it is possible that Palaeocristis may be off the direct line, and
that the Felidae are sprung from Amphisba. Be this as it may,
from another group of creodonta, represented by Vivipara (Mioica),
Viverra (Dinictis) and Uumane, is probably the true split of the
related Cynodont, with a dental formula like that of Canis
Cyolin, a perforation to the humerus, and an apparently undisputed
auditory bull; and from Cynodont, the transition is easy to the
Carnivora. It should be mentioned, however, that there is a group
of North American carnivora, the Diverse, which is known as
Prolecanor, and Tenebrion, which agree with Canis in the shortness
of the jaws, and with that genus and Speothos in the cutting-edge
of the lower sectorial. Possibly these genera may be nearly related
to Ouello, and the genera may be related to Aeluropus.

By means of the Amphiocinae, as represented by the Middle
Tertiary genera Promruera, Pseudamphicn, and Amphisba, in
which the lower incisors are three upper molars, we have a type
from the Cynodont-type to the bear-group; one of the later intermediate
forms being the Lower Ploce Hoold Hyaenarctis, in which the
two upper molars are splayed and foreshadow those of Ursus
itself. The upper incisors and premolars are more closely related
to Aeluropus. An allied type is found in Arcorthus of the South
American Pleistocene.

By the loss of the third lower molar and certain modifications of
the other teeth and skull, the Miocene genus Pleistis may be derived
from Cynodont, its dental formula being i., c,., p., s., m., 2.

Now Pleistis is nothing more than a generated representative of the
Mammalia. We have thus traced three out of the four modern
carnivora groups, that of Procyonidae and Viverridae, from the
family (apart from the Asiatic Ursus and Arctotherium) which are connected
with the last-named genus through the North American Oligocene
Phalacous, which is stated to be in almost every respect inter-
mediate between Liotheri and Cynodont, while the living Bar-
saricus is stated to show closer signs of affinity with Cynodontis
than with Phalacoyn.

To deal with fossil representatives of living genera, or extinct
carnivora, we have the following:

Garde, Histoire du Second Empire (1894 and seq.).

CARNOT, LAZARE NICOLAS MARGUERITE (1753–1823),
French general, was born at Nolay in Burgundy in 1753.
He received his training as an engineer at Mézières, becoming
an officer of the Corps de Génie in 1773 and a captain ten
years later. He had then just published his first work, an Essai sur les machines en général.
In 1784 he wrote an essay on ballistiques, and his Élèves de l'artillerie (1792) became
the classic work of Prince Henry of Prussia. But as the result of a
dispute with Montalembert, Carnot abandoned the official,
or Vauban, theories of the art of fortification, and went over to
the "perpendicular" school of Montalembert. He was conse-
quentially imprisoned, on the pretext of having fought a duel,
and only released when selected to accompany Prince
Henry of Prussia in a visit to Vauban's fortifications. In 1791 he
married. The Revolution drew him into political life, and he
was elected a deputy for the Pas de Calais. In the Assembly he
CARNOT, M. F. S.

took a prominent part in debates connected with the army. Carnot was a stern and sincere republican, and voted for the execution of the king. In the campaigns of 1792 and 1793, he was continually employed as a commissioner in military matters, his greatest service being in April 1793 on the north-eastern frontier, where the disastrous battle of Neerwinden and the subsequent defection of Dumouriez had thrown everything into confusion. After doing what was possible to infuse energy into the operations of the French forces, he returned to Paris and was made a member of the Committee of Public Safety. He was charged with duties corresponding to those of the modern chief of the general staff and adjutant-general. As a member of the committee he signed its decrees and was thus at least technically responsible for the acts of the Reign of Terror. His energies were, however, directed to the organization, not yet of victory, but of defence. His labours were incessant; practically every military document in the archives of the committee was Carnot's own work, and he was repeatedly in the field with the armies. His part in Jourdan's great victory at Wattignies was so important that the credit of the day has often been assigned to Carnot. The winter of 1793-1794 was spent in new preparations, in instituting a severe discipline in the new and ill-trained troops of the republic, and in improving means and measures of war. He continued to visit the armies at the front, and to inspire them with energy. He acquiesced in the fall of Robespierre in 1794, but later defended Barère and others among his colleagues, declaring that he himself had constantly signed papers without reading them, as it was physically impossible to do so in the press of business. When Carnot's arrest was demanded in May 1795, a deputy cried "Will you dare to lay hands on the man who has organized victory?" Carnot had just accepted promotion to the rank of major in the engineering troops. Throughout 1793, when he had been the soul of the national defence, and 1794, in which year he had "organized victory" in fourteen armies, he was a simple captain.

Carnot was elected one of the five Directors in November 1795, and continued to direct the war department during the campaign of 1796. Late in 1796 he was made a member (1st class) of the Institute, which he had helped to establish. He was for two periods president of the Directory, but on the coup d'état of the 18th Fructidor (1793) was forced to take refuge in England. He returned to France after the 18th Brumaire (1799) and was re-elected to the Institute in 1800. Early in 1800 he became minister of war, and he accompanied Moreau in the early part of the Rhine campaign. His chief work was, however, in reducing the expenses of the armies. Contrary to the usual custom he refused to receive presents from contractors, and he effected much-needed reforms in every part of the military administration. He tendered his resignation later in the year, but it was long before the First Consul would accept it. From 1801 he lived in retirement with his family, employing himself chiefly in scientific pursuits. As a senator he consistently opposed the increasing monarchism of Napoleon, who, however, gave him in 1809 a pension and commissioned him to write a work on fortification for the school of Metz. In these years he had published De la coordination des figures de géométrie (1801), Géométrie de position (1803), and Principes fondamentaux de l'équilibre et du mouvement (1806), all of which were translated into German. His great work on fortification appeared at Paris, 1818 (De la défense de places fortes), and was translated for the use of almost every army in Europe. He took Montalembert as his ground-work. Without sharing Montalembert's antipathy to the bastardized trace, and his predilection for high mammoniary casements, he followed out the principle of retarding the development of the attack, and provided for the most active defence. To facilitate sorties in great force he did away with a countercap wall, providing instead a long gentle slope from the bottom of the ditch to the crest of the glacis. This, he imagined, would compel an assailant to maintain large forces in the advanced trenches, which he proposed to attack by vertical fire from mortars. Along the front of his fortress was built a heavy detached wall, loopholed for fire, and sufficiently high to be a most formidable obstacle. This "Carnot wall," and, in general, Carnot's principle of active defence, played a great part in the art of modern fortification.

He did not seek employment in the field in the aggressive wars of Napoleon, remaining a sincere republican, but in 1814, when France itself was once more in danger, Carnot at once offered his services. He was made a general of division, and Napoleon sent him to the important fortress of Antwerp as governor. His defence of that place was one of the most brilliant episodes of the campaign of 1814. On his return to Paris he addressed a political memoir to the restored king of France, which aroused much attention both in France and abroad. He joined Napoleon during the Hundred Days and was made minister of the interior, the office carrying with it the dignity of count, and on the 2nd of June he was made a peer of France. On the second Restoration he was proscribed. He lived thenceforward in Meudon, occupying himself still with science. But his health rapidly declined, and he died at Meudon on the 2nd of August 1823. His remains were solemnly removed to the Panthéon in 1889. Long before this, in 1835, Antwerp had erected a statue to its defender of 1814. In 1837 Arago pronounced his clé de voûte before the Académie des Sciences. The sincerity of his heart and his political convictions was proved in 1801-1804 and in 1814. The memory of his military career is preserved in the title, given to him in the Assembly, of "The organizer of victory." His sons, Sadi and L. Hippolyte, are separately noticed.

Arnaudy in La Grande Encyclopédie, h. 1887.

CARNOT, MARIE FRANÇOIS SADI (1837-1894), fourth president of the third French Republic, son of L. Hippolyte Carnot, was born at Limoges on the 11th of August 1837. He was educated as a civil engineer, and after having highly distinguished himself at the École Polytechnique and the École des Ponts et Chaussées, obtained an appointment in the public service. His hereditary republicanism recommended him to the government of national defence, by which he was entrusted in 1870 with the task of organizing resistance in the departments of the Eure, Calvados and Seine Inférieure, and made prefect of the last named in January 1871. In the following month he was elected to the National Assembly by the department Côte d'Or. In August 1878 he was appointed secretary to the minister of public works. In September 1880 he became minister, and again in April 1885, passing almost immediately to the ministry of finance, which he held under both the Ferry and the Freycinet administrations until December 1886. When the Wilson scandals occasioned the downfall of Grévy in December 1887, Carnot's high character for integrity marked him out as a candidate for the presidency, and he obtained the support of the Third Republic and all those who objected to the candidature of men who have been more active in the political arena, so that he was elected by 616 votes out of 837. He assumed office at a critical period, when the republic was all but openly attacked by General Boulanger. President Carnot's ostensible part during this agitation was mainly confined to augmenting his popularity by well-timed appearances on public occasions, which gained credit for the presidency and the republic. When early in 1889, Boulanger was finally driven into exile, it fell to President Carnot's lot to appear at the head of the state on two occasions of especial interest, the celebration of the centenary of 1789 and the opening of the Paris Exhibition of that year. The perfect success of both was regarded, not unreasonably, as a popular ratification of the republic, and though continually
CARNOT, S. N. L.—CARO, A.

harassed by the formation and dissolution of ephemeral ministries, by socialist outbreaks, and the beginnings of anti-Semitism, Carnot had but one serious crisis to surmount, the Parma scandals of 1892, which if they greatly damaged the prestige of the state, increased the respect felt for his head, against whose integrity none could breathe a word. Carnot seemed to be arriving at the zenith of popularity, when on the 24th of June 1894, after delivering at a public banquet at Lyons a speech in which he appeared to imply that he nevertheless would not seek re-election, he was stabbed by an Italian anarchist named Caserio and expired almost immediately. The horror and grief excited by this tragedy were boundless, and the president was honoured with a splendid funeral in the Panthéon, Paris. His son, François Carnot, was first elected deputy for the Côte d’Or in 1902.

CARNOT, SADI NICOLAS LÉONHARD (1796-1832), French physicist, elder son of L. N. M. Carnot, was born at Paris on the 1st of June 1796. He was admitted to the École Polytechnique in 1812, and late in 1814 he left with a commission in the Engineers and with prospects of rapid advancement in his profession. But Waterloo and the Restoration led to a second and final proscription of his father, and those of himself. Sadi Carnot purposely told off for the merest drudgeries of his service. Disgusted with an employment which afforded him neither leisure for original work nor opportunities for acquiring scientific instruction, he presented himself in 1816 at the examination for admission to the staff corps (état-major) and obtained a lieutenant. He then devoted himself with astonishing ardour to mathematics, chemistry, natural history, technology and even political economy. He was an enthusiast in music and other fine arts; and he habitually practised as an amusement, while deeply studying in theory, all sorts of artistic sports, including swimming and fencing. He became captain in the Engineers in 1822, but left the service altogether in the following year. His naturally feeble constitution, further weakened by excessive study, broke down finally in 1832. An attack of scarlatina led to brain fever, and he died on 24th of August 1832. He was one of the most original and profound thinkers his age, and he is one of the most valuable contributions to science. The only work he published was his Réflexions sur la puissance motrice du feu et sur les machines propres à développer cette puissance (Paris, 1824). This contains but a fragment of his scientific discoveries, but it is sufficient to put him in the very foremost rank, though its full value was not recognized until pointed out by Lord Kelvin in 1848 and 1849. Fortunately his manuscripts had been preserved, and extracts were appended to a reprint of his Puissance motrice by his brother, L. H. Carnot, in 1878. These show that he had not only realized for himself the true nature of heat, but had noted down in detail many of the best modern methods of finding its mechanical equivalent, such as those of J. P. Joule with the perforated piston and with the friction of water and mercury. Lord Kelvin’s experiment with a current of gas forced through a porous plug is also given. "Carnot’s principle is fundamental in the theory of thermodynamics."

CARNOSTIE, a police burgh and watering-place of Forfarshire, Scotland. Pop. (1901) 5204. It lies on the North Sea, 153 m. E. N. W. of Dundee by the North British railway. Bathing and golfing are good. Barry Links, a triangular sandy track occupying the south-eastern corner of the shire, are used as a camping and manoeuvring ground for the artillery and infantry forces of the district, and occasionally of Scotland. Its most extreme point is called Buddon Ness, off which are the dangerous shoals locally known as the Roaring Lion, in consequence of the deep boom of the waves. On the Ness two lighthouses have been built at different levels, the lights of which are visible at 13 and 16 m.

CARNUNTUM (Kapuvīrā in Ptolemy), an important Roman fortress, originally belonging to Noricum, but after the 1st century A.D. to Pannonia. It was a Celtic town, the name, which is nearly always found with K on monuments, being derived from Caru, Kaun ("rock," "cairn"). Its extensive ruins may still be seen near Hainburg, between Deutsch-Altenburg and Petronell, in lower Austria. Its name first occurs in history during the reign of Augustus (A.D. 6), when Tiberius made it his base of operations in the campaigns against Maroboduus (Marbod). A few years later it became the centre of the Roman fortifications along the Danube from Vindobona (Vienna) to Brigetio (Oszony), and (under Trajan or Hadrian) the permanent quarters of the XV legion. It was also a very old mart for the amber brought to Italy from the north. It was created a municipality by Hadrian (Aelium Carnuntum). Marcus Aurelius resided there for three years (172-175) during the war against the Marcomanni, and wrote part of his Meditations. Septimius Severus, at the time governor of Pannonia, was proclaimed emperor there by the soldiers (193). In the 4th century it was destroyed by the Germans, and, although partly restored by Valentinian I., it never regained its former importance, and Vindobona became the chief military centre. It was finally destroyed by the Hungarian tribes in the 9th century. A special society (Carnutum-Ν) exists for the exploration of the numerous ruins, the results of which will be found in J. W. Kubitschek and S. Frankfurter, Führer durch Carnuntum (3rd ed.; 1894); see also E. von Sacken, Die römische Stadt Carnuntum, "Zeitschrift für Geschichte der Naturwissenschaften" (1892); article by Kubitschek in Pauly-Wissowa's Realencyclopaedie, i., part ii. (1899); Corpus Inscriptionum Latinarum, i., part i. p. 350.

CARNUTES (Carnutii, Carnuatae, Kapuvīrāi in Plutarch), a Celtic people of central Gaul, between the Sequana (Seine) and the Liger (Loire). Their territory corresponded to the dioceses of Chartres, Orléans and Blois, that is, the greater part of the modern departments of Eure-et-Loir, Loir-et-Cher, Loiret and Cher, regarded as an independent unit during the central period of the Gallic nation. The chief towns were Cenabum (not Genabum; Orléans) and Autricum (Chartres). According to Livy (v. 34) the Carnutes were one of the tribes which accompanied Bellavesus in his invasion of Italy during the reign of Tarquinius Priscus. In the time of Caesar they were dependents of the Remi, who on one occasion interceded for them. In 52 they joined in the rebellion of Vercingetorix. As a punishment for the treacherous murder of some Roman merchants and one of Caesar’s commissariat officers at Cenabum, the town was burnt and the inhabitants put to the sword or sold as slaves. During the war they sent 12,000 men to relieve Alesia, but shared in the defeat of the Gallic army. Having attacked the Bituriges Cubi, who appealed to Caesar for assistance, they were forced to submit. Under Augustus, the Carnutes, as one of the peoples of Lugdunensis, were raised to the rank of civitas socia or foederata, retaining their own institutions, and only bound to render military service to the emperor. Up to the 3rd century Autricum (later Carnutes, whence Chartres) was the capital, but in 275 Aurelian changed Cenabum from a vicus into a civitas and named it Aurelianum or Aurelianum urbi (the modern Orléans).

See Caesar, Bell. Gall. v. 25, 29, viii. 8, 11, 75, vii. 5, 31; Strabo iv. pp. 191-193; R. Boutrays, Orbis gentis Carnutum historia (1624); A. Desjardins, Géographie historique de la Gaule, i. (1876-1893); article and bibliography in La Grande Encyclopédie; T. R. Holmes, Caesar’s Conquest of Gaul (1899), p. 402, on Cenabum.

CARO ANIBALDE (1507-1566), Italian poet, was born at Civita Nuova in Ancona, in 1507. He became a member of the family of Lodovico Gaddi, a rich Florentine, and then secretary to his brother Giovanni, by whom he was presented to a valuable ecclesiastical preferment at Rome. At Gaddi’s death, he entered the service of the Farnese family, and became confidential secretary in succession to Pietro Lodovico, duke of Parma, and to his sons, duke Ottavio and cardinals Ranuccio and Alexander. Caro’s most important work was his translation of the Aeneid (Venice, 1583; Paris, 1760). He is also the author of Rime, Canzoni, and sonnets, a comedy named Gli Straccioni, and two clever jeux d’esprit, one in praise of figs, La Ficheide, and another in eulogy of the big nose of Leonio Ancona, president of the Academia della Vertù. Caro’s poetry is distinguished by very
considerable ability, and particularly by the freedom and grace of its versification; indeed he may be said to have brought the verso sciollo to the highest development it has reached in Italy. His prose works consists of translations from Aristo, Cyprian and various other authors, written in his own name and in those of the cardinals Farnese, which are remarkable both for the baseness they display and for their euphemistic polish and elegance. His fame has been greatly damaged by the virulence with which he attacked Lodovico Castelvetro in one of his canzoni, and by his meanness in denouncing him to the Holy Office as translator of some of the writings of Melanthion. He died at Rome about 1566.

CARO, ELME MARIE (1826–1887), French philosopher, was born on the 4th of March 1826 at Poitiers. His father, a professor of philosophy, gave him an excellent education at the Stanislas College and the Ecole Normale, where he graduated in 1848. After being professor of philosophy at several provincial universities, he received the degree of doctor, and came to Paris in 1858 as master of conferences at the Ecole Normale. In 1861 he became inspector of the Academy of Paris, and in 1864 professor of philosophy to the Faculty of Letters, and in 1874 a member of the French Academy. He married Pauline Cassin, the authoress of the Pêché de Madeleine and other well-known novels. He died in Paris on the 13th of July 1887. In his philosophy he was mainly concerned to defend Christianity against modern Positivism. The philosophy of Cousin influenced him strongly, but his strength lay in exposition and criticism rather than in origin or thought. Besides important contributions to La France and the Revue des deux mondes, he wrote Le Mysticisme au XVIIIe siècle (1852–54), L'Idée de Dieu (1864), Le Matérialisme et la science (1868), Le Positivisme au XIXe siècle (1878), Jours d'épreuves (1872), M. Littre et le positivisme (1883), George Sand et portraits (1888), La Philosophie de Gobineau (2nd ed., 1886).

CAROL (O. Fr. carole), a hymn of praise, especially such as is sung at Christmas in the open air. The origin of the word is obscure. Diez suggests that the word is derived from chorus. Others ally it with corolla, a garland, circle or crown,1 the earliest sense of the word being apparently "a ring" or "circle," "a ring dance." Stonehenge, often called the Giants' Dance, was also frequently known as the Carol; thus Harding, Chron. lx. x., "Within (the) Giantes Carole, that so they hight, The (Stone henges) that nowe so named been." The Celtic forms, often cited as giving the origin of the word, are derivatives of the English or French. The cib set up in the churches at Christmas was the centre of a dance, and some of the most famous of Latin Christmas hymns were written to dance tunes. These songs were called Wiegelnieder in German, nôls in French, and carols in English. They were originally modelled on the songs written to accompany the choric dance, which were probably the starting point of the lyric poetry of the Germanic peoples. Strictly speaking, therefore, the word should be applied to lyrics written to dance measures; in common acceptance it is applied to the songs written for the Christmas festivities. Carolling, i.e. the combined exercise of dance and song, found its way from pagan ritual into the Christian church, and the clergy, however averse they might be from heathen survivals, had to content themselves in this, as in many other cases, with limiting the practice. The third council of Toledo (586) forbade dancing in the churches on the vigils of saints' days, and secular dances in church were forbidden by the council of Auxerre in the next year. Even as late as 1200 it was necessary for the council of Avignon to forbid theatrical dances and secular songs in churches. Religious dances persisted longest on Shrove Tuesday, and a castanet dance by the choristers round the lectern is permitted three times a year in the cathedral of Seville. The Christmas festival, which synchronized with and superseded the Latin and Teutonic feasts of the winter solstice, lent itself especially to gaiety. The "crib" of the Saviour was set up in the churches or in private houses, in the traditional setting of the stable, with earthen figures of the Holy Family, and candles and carols were sung and danced around it. The "rocking of the cradle" was the occasion of dialogue between Joseph and Mary which was not without elements of comedy, and gave rise to lullabies such as the well-known German Dormi fili. The adoration of the shepherds and the visit of the Magi also provided matter for dramatic and choral representation. The singing of the carol has survived in places where the institution of the "crib," said to have been originated by St Francis of Assisi to inculcate the doctrine of the incarnation, has been long in disuse, but in the West Riding of Yorkshire the children who go round carol-singing still carry "milly-boxes" (My Lady boxes) containing figures which represent the Virgin and Child.

That carol-singing early became a pretext for the asking of alms is obvious from an Anglo-Norman carol preserved in the British Museum (MS. Reg. 16 E. viii.), Seigneurs ore entendye à nus, which is little more than a drinking song. Carols were an important element in the mystery plays of the Nativity, and of these, included in the Marguerites de la Marguerite des princesses, très-illustre reine de Navarre (Lyons, 1547), incidentally gives evidence of the connexion of dancing and carol-singing, for the shepherds and shepherdesses open their chorus at the manger with "Dansons, chantons, faisons rages. There is a long English carol relating the chief incidents of the life of Christ, which is a curious example of the mixture of the sacred and profane common in this species of composition. It begins "To-morrow shall be my dancing day," and has for refrain—"Sing, oh! my love, oh! my love, my love; This have I done for my true love."

There are extant numerous carols dating from the 15th century which have the characteristic features of folksong. The famous Cherry-tree Carol, "Joseph was an old man," is based on an old legend which is related in the Coventry mystery plays. "I saw three ships come sailing in," and "The Camel and the Crane," though of more modern date, preserve curious legends. Numerous entries in the household accounts of the Tudor sovereigns show that carol-singing was popular throughout the 16th century, and the literature of Christmas was enriched in the next century by poems which are often included in collections of carols, though they were probably written to be read rather than sung. Milton, Crashaw, Southwell, Ben Jonson, George Herbert and George Wither all produced Christmas poems, but the richest collection by any one poet is to be found in the poems of Herrick, whose "Come, bring with a noise" is a typical carol of the jovial kind, and may well have been written to a dance tune. Among 18th-century religious carols perhaps the most famous is Charles Wesley's "Hark, how all the welkin rings," better known in the version, "Hark, the herald angels sing." The artificial modern revival of carol-singing has produced a quantity of new carols, the best of which are perhaps mostly derived from medieval Latin Christmas hymns. Among the many modern Christmas poems one of the most striking is Swinburne's "Three Damsels in the Queen's Chamber," which is, however, a ballad rather than a carol.

The earliest printed collection of carols was issued by Wynkyn de Worde in 1521. It contained the famous Boar's Head Carol, Caput apri defero, Reddens laudes Domino, which in a slightly altered form is sung at Queen's College, Oxford, on the bringing in of the boar's head. Modern collections of ancient carols are derived chiefly from three tracts belonging to the collection of Anthony a Wood, preserved in the Bodleian library, from a 15th-century MS. (Sloane 2593), a 16th-century MS. with the music (Add. 5665), and other Mss. in the British Museum, and from oral tradition. In the 18th century T. Bloomer of Birmingham published a number of carols in the form of broadsides. Among the numerous collections of French carols is Noël Bourguignon de Gui Bardde (1720), giving the words and the music of thirty-four noëls, many of them very free in character.
CAROLINE—

and the circle; law, George Hervey, Gay, their Leibnitz, took and Charlotte, Poems The Blackheath; her birth kept rest accessible Berlin, and Lord education Memoirs the 1727 on King Old, for whose Essai by her 14 and acquired Britain, was Caroline (1683-1737), wife of George II., king of Great Britain and Ireland, was a daughter of John Frederick, margrave of Brandenburg-Ausch (d. 1686). Born at Ansbach on the 1st of March 1683, the princess passed her youth mainly at Dresden and Berlin, where she enjoyed the close friendship of Sophie Charlotte, wife of Frederick I. of Prussia; she married George Augustus, Elector of Hanover, in September 1705. The early years of her married life were spent in Hanover. She took a continual interest in the approaching accession of the Hanoverian dynasty to the British throne, was on very friendly terms with the old electress Sophia, and corresponded with Leibnitz, whose acquaintance she had made in Berlin. In October 1714 Caroline followed her husband and her father-in-law, now King George I., to London. As princess of Wales she was accessible and popular, and took the first place at court, filling a difficult position with tact and success. When the quarrel between the prince of Wales and his father was attaining serious proportions, Caroline naturally took the part of her husband, and matters reached a climax in 1717. Driven from court, ostracized by the king, deprived even of the custody of their children, the prince and princess took up their residence in London at Leicester House, and in the country at Richmond. They managed, however, to surround themselves with a distinguished circle; Caroline had a certain taste for literature, and among their attendants and visitors were Lord Chesterfield, Pope, Gay, Lord Hervey and his wife, the beautiful Mary Lepel. A formal reconciliation with George I. took place in 1720. In October 1722 Caroline returned to Hanover, and during the rest of her life Queen Caroline’s influence in English politics was very chiefly exercised in support of Sir Robert Walpole; she kept this minister in power, and in control of church patronage. She was exceedingly tolerant, and the bishops appointed by her were remarkable rather for learning than for orthodoxy. During the king’s absences from England she was regent of the kingdom on four occasions. On the whole, Caroline’s relations with her husband, to whom she bore eight children, were satisfactory. A clever and patient woman, she was very compliant towards the king, flattering his vanity and acknowledging his mistresses, and she retained her influence over him to the end. She died on the 20th of November 1737.

Caroline appears in Scott’s Heart of Midlothian; see also Lord Hervey, Memoirs of the Reign of George II., ed. by J. W. Croker (1844); W. H. Wilkins, Caroline the Illustrious (1904); and A. D. Greenwood, Lives of the Hanoverian Queens of England, vol. i. (1909).

CAROLINE AMELIA AUGUSTA (1768-1821), queen of George IV., of Great Britain, second daughter of Charles William Ferdinand, duke of Brunswick-Wolfenbüttel, was born on the 17th of May 1768. She was brought up with great strictness, and her education was more than usually severe. In line to the throne, she was married to the then prince of Wales (see GEORGE IV.), who disliked her and separated from her after the birth of a daughter in January 1796. The princess resided at Blackheath; and as she was thought to have been badly treated by her profligate husband, the sympathies of the people were strongly in her favour. About 1786 reports reflecting on her conduct were circulated so openly that it was deemed necessary for a commission to inquire into the circumstances. The princess was acquitted of any serious fault, but various improprieties in her conduct were pointed out and censured. In 1814 she left England and travelled on the continent, residing principally in Italy. On the accession of George in 1820, orders were given that the English ambassador should protest against the recognition of the princess as queen at any foreign court. Her name also was formally omitted from the liturgy. These acts stirred up a strong feeling in favour of the princess among the English people generally, and she at once made arrangements for returning to England and claiming her rights. She rejected a proposal that she should receive an annuity of £50,000 a year on condition of renouncing her title and remaining abroad. Further efforts at compromise proved unavailing; Caroline arrived in England on the 6th of June, and one month later a bill to dissolve her marriage with the king on the ground of adultery was brought into the House of Lords. The trial began on the 17th of August 1820, and on the 10th of November the bill, after passing the third reading, was abandoned. The public excitement had been intense, the boldness of the queen’s counsel, Brougham and Denman, unparalleled, and the ministers felt that the smallness of their majority was virtual defeat. The queen was allowed to assume her title, but she was refused admission to Westminster Hall on the coronation day, July 19, 1821. Mortification at this event seems to have hastened her death, which took place on the 7th of August of the same year.

See A Queen of Indiscretions, The Tragedy of Caroline of Brunswick, Queen of Great Britain, translated by F. Chapman from the Italian of Graziano Paolo Clerici (London, 1907). With many portraits, &c. Of contemporary authorities the Crewey Papers (1905) throw the most interesting sidelights on the subject.

CAROLINE ISLANDS, a widely-scattered archipelago in the Pacific Ocean, E. of the Philippines and N. of New Guinea, included in Micronesia; between 5° and 10° N., and 150° and 165° E., belonging to Germany. They fall into three main groups, the Western, Central and Eastern Carolines, the central being the most numerous, while the western include the Pelew group. The total land area is about 380 sq. m., and of this, 307 sq. m. is covered by the four main islands, Ponape and Kusaie in the eastern group, Truk or Hogilou in the central, and Yap in the western. These islands are of considerable elevation (the highest point of Ponape approaches 3000 ft.), but the rest are generally low coral islets. The climate is equable and moist, but healthy; the islands are subject to heavy storms. The total population is estimated at 36,000. The inhabitants, who are Micronesian hybrids of finer physique than their kinsmen of the Pelew Islands, have a comparatively high mental standard, being careful agriculturists, and peculiarly clever boatbuilders and navigators. The Germans divide the whole archipelago into two administrative districts, eastern and western, having the seats of government at Ponape and Yap respectively. The principal article of export is copra. The islands were discovered (at least in part) by the Portuguese Diego da Rocha in 1527, and called by him the Sequeira Islands. In 1686 Admiral Francesco Laeveno, who made further explorations, renamed them the Carolines in honour of Charles II. of Spain. The islands were subsequently visited by a few travellers; but the natives have only in modern times been reconciled to the presence of foreigners; an early visit of missionaries (1731) resulted in one of several murderous attacks on white men which daren the history of the islands; and it was only in 1875 that Spain, claiming the group, made some attempt to assert her rights. These were contested by Germany, whose flag was hoisted on Yap, and the matter was referred to the arbitration of Pope Pius IX. In 1885, Spain recognized by the Treaty of Hannover, the international law of the group to Germany, which has since been recognized by other nations, and by the United States. In 1899 Germany took over the administration of the islands from Spain, paying 25,000,000 pesetas (nearly £1,000,000 sterling).

Ancient Stone Buildings.—In Ponape and Kusaie, massive stone structures, similar to those which occur in several other parts of the Pacific Ocean, have long been known to exist. They have been closely explored by Herr Kubary, Mr F. J. Moss, and later Mr F. W. Christian. None of the colossal structures hitherto described appears to have been erected by the present Melanesian
or Polynesian peoples, while their wide diffusion, extending as far as Easter Island, within 400 m. of the New World, points to the occupation of the Pacific lands by a prehistoric race which had made some advance in general culture. The Funafuti borings (1897) show almost beyond a doubt that Polynesia is an area of comparatively recent subsidence. Hence the land connections must have formerly been much easier and far more continuous than at present. The dolmen-builders of the New Stone Age are now known to have long occupied both Korea and Japan, from which advanced Asiatic lands they may have found little difficulty in spreading over the Polynesian world, just as in the extreme west they were able to range over Scandia-
navia, Great Britain and Ireland. To Neolithic man, still perhaps represented by some of the more light-coloured and more regular-featured Polynesian groups, may therefore not unreasonably be attributed these astonishing remains, which assume so many different forms according to the nature of the locality, but seem generally so out of proportion with the present restricted areas on which they stand. With the gradual subsidence of these areas their culture would necessarily degenerate, although echoes of sublime theories and philosophies are still heard in the oral traditions and folklore of many Polynesian peoples. In the islet of Lele, close to Kiriwina, at the rounded extremity of Manus, the rubbish of the occupation of Micronesia, the rubbish, being the decurrence of a citadel with cyclopean ram- ments built of large basaltic blocks. There are also numerous canals, and what look like artificial harbours constructed amid the shallow lagoons.

In Ponape the remains are of a somewhat similar character, but on a much larger scale, and with this difference, that while those of Lele all stand on the land, those of Ponape are built in the water. The whole island is strewn with natural basaltic prisms, some of great size; and of this material, brought by boats or rafts from a distance of 30 m. and put together without any mortar, but sustained by their own weight, are built all the massive walls and other structures on the east side of the island. The walls of the main building near the entrance of Metalamin harbour form a massive quadrangle 300 ft. on all sides, with inner courts, vault and raised platform with walls 20 to 40 ft. high and from 8 to 18 ft. thick. Some of the blocks are 25 ft. long and 8 ft. in circumference, and many of them weigh from 3 to 4 tons. There are also numerous canals from 30 to 100 ft. wide, and in a large number of islets, mainly artificial, covering an area of 9 sq. m., have all been built up out of the shallow waters of the lagoon round about the entrance of the harbour, with high sea-walls composed of the same huge basaltic prisms. In some places the walls of this “Pacific Venice” are now submerged to some depth, as if the land had subsided since the construction of these extensive works. Elsewhere huge break-
waters had been constructed, the fragments of which may still be seen stretching away for a distance of from 2 to 3 m. Most observers, such as Admiral Sir Cyprian Bridge and Mr L. Hence, agree that these structures could not possibly be the work of any of the present Polynesian peoples, and attribute them to a now extinct prehistoric race, the men of the New Stone Age from the Asiatic mainland.

Stone Money. — The inhabitants of Yap are noted for possessing the most extraordinary currency, if it can be so called, in the whole world. Besides the ordinary shell money, there is a great variety of stone currency, consisting of huge calcite or limestone discs or wheels from 6 to 12 ft. in diameter, and weighing up to nearly 5 tons. These are all quarried in the Puluw Islands, 200 m. to the south, and are now brought to Yap in European vessels. But some were in the island long before the arrival of the whites, and must consequently have been brought by native vessels or on rafts. The stones, which are rather tokens than money, do not circulate, but are piled up round about the chief’s treasure-
house, and appear to be regarded as public property, although it is hard to say what particular use they can serve. They appear to be kept rather for show and ornament than for use.

CAROLINIANS—CARORA

CAROLINIANS, the name of a family (so called from Charle-

magne, its most illustrious member) which gained the throne of France A.D. 751. It appeared in history in 613, its origin being traced to Arnulf (Aroul), bishop of Metz, and Pippin, long called Pippin of Landen, but more correctly Pippin the Old or Pippin I. Albiet of illustrious descent, the genealogies which represent Arnulf as an Aquitanian noble, and his family as connected—by more or less complicated devices—with the saints honoured in Aquitaine, are worthless, dating from the time of Louis the Pious in the 9th century. Arnulf was one of the Austrasian nobles who appealed to Clovis II., king of Neustria, against Brunhilda, and it was in reward for his services that he received from Clotaire the bishopric of Metz (613). Pippin, also an Austrasian noble, called himself the son of Pippin I. Toward the end of the 7th century Pippin II., called incorrectly Pippin of Heristal, secured a preponderant authority in Austrasia, marched at the head of the Austrasians against Neustria, and gained a decisive victory at Tretty, near St. Quentin (687). From that date he may be said to have been sole master of the Frankish kingdom, which he governed till his death (714). In Neustria Pippin gave the mayoralty of the palace to his son Grimoald, and afterwards to Grimoald’s son Theode-

fort; the mayoralty in Austrasia he gave to his son Drogo, and subsequently to Drogo’s children, Arnulf and Hugh. Charles Martel, however, a son of Pippin by a concubine Chalpada, seized the mayoralty in both kingdoms, and he it was who continued the Carolingian dynasty. Charles Martel governed from 714 to 741. and in 751 his son Pippin III. took the title of king. The Carolingian dynasty reigned in France from 751 to 987, when it was ousted by the Capetian dynasty. In Germany descendants of Pippin reigned till the death of Louis the Child in 911; in Italy the Carolingians maintained their position until the deposition of Charles the Fat in 887. Charles, duke of Lower Lorraine, who was thrown into prison by Hugh Capet in 991, left two sons, the last male descendants of the Carolingians, Otto, who was also duke of Lower Lorraine and died without issue, and Louis, who after the year 1000 vanishes from history.

See P. A. F. Gérard and L. A. Warnkönig, Histoire des Carolingiens (Brussels, 1852); H. E. Bonnell, Anfänge des Karoling. Hauses (Berlin, 1866); J. F. Bömmel, and F. M. del Poso, Kaiserreich unter d. Karolingern (Innsbruck, 1889 seq.); E. Mühl-
bacher, Deutsche Gesch. unter d. Karolingern (Stuttgart, 1866); F. Lot, Les Derniers Carolingiens (Paris, 1861).

CAROLUS-DURAN, the name adopted by the French painter Charles Auguste Emile Durand (1837— ), who was born at Lille on the 4th of July 1837. He studied at the Lille Academy and then went to Paris, and in 1861 to Italy and Spain for further study, especially delighting himself in the pictures of the 13th century. His first great picture, Murdered, or The Abduction (1866), was one of his first successes, and is now in the Lille museum, but he became best known afterwards as a portrait-
painter, and as the head of one of the principal ateliers in Paris, where some of the most brilliant artists of a later generation were his pupils. His “Lady with the Glove” (1869), a portrait of his own wife, was bought for the Luxembourg. In 1880 he was made a commander of the Legion of Honour. He became a member of the Académie des Beaux-Arts in 1904, and in the next year was appointed director of the French academy at Rome in succession to Eugène Guillaume.

CARORA, an inland town of the state of Lara, Venezuela, on the Carora, a branch of the Tuy River, about 54 m. W. by S. of the city of Barquisimeto, and 1328 ft. above sea-level. Pop. (1908 estimate) 6000. The town is comparatively well-built
and possesses a fine parish church, and a Franciscan convent and hermitage. It was founded in 1754, and its colonial history shows considerable prosperity, its population at that time numbering 8000 to 10,000. The neighbouring country is devoted principally to raising horses, mules and cattle; and in addition to hides and leather, it exports rubber and other forest products.

CARP, the typical fish of a large family (Cyprinidae) of Ostariophysi, as they have been called by M. Sagemehl, in which the air-bladder is connected with the ear by a chain of small bones (so-called Weberian ossicles). The mouth is usually more or less protractile and always toothless; the lower pharyngeal bones, which are large and falciform, subparallel to the branchial arches, are provided with teeth, often large and highly specialized, in one, two or three series (pharyngeal teeth), usually working against a horny plate attached to a vertical process of the basioccipital bone produced under the anterior vertebrae, mastication being performed in the gutlet. These teeth, adapted to various requirements, vary according to the genus, being conical, hooked, spoon-shaped, molariform, &c.

The species are extremely numerous, about 1500 being known, nearly entirely confined to fresh water, and feeding on vegetable substances or small animals. They are dispersed over the whole world with the exception of South America, Madagascar, Papuasia, and Australasia. Remains of several of the existing genera have been found in Oligocene and later beds of Europe, Sumatra and North America. One member of the Cyprinidae is at present known to be viviparous, but no observations have as yet been made on its habits. It is a small barbel discovered in Natal by Max Weber, and described by him under the name Barbus viviparus.

The Cyprinidae are divided into four subfamilies:—Catosminae (mostly from North America, with a few species from China and eastern Siberia), in which the maxillary bones take a share in the border of the mouth, and the pharyngeal teeth are very numerous and form a single, comb-like series; Cyprininae, the great bulk of the family, more or less conforming to the type of the carp; Cobitinae, or loaches (Europe, Asia, Abyssinia), which are dealt with in a separate article (see Loach); and the Homolopterinae (China and south-eastern Asia), mountain forms allied to the loaches, with a quite rudimentary air-bladder.

For descriptions of other Cyprinids than the carp, see Goldfish, Barbel, Gudgeon, Rudd, Roach, Chub, Dace, Minnow, Tench, Bream, Bleak, Bitterling, Mahseer.

The carp itself, Cyprinus carpio, has a very wide distribution, having spread, through the agency of man, over nearly the whole of Europe and a part of North America, where it lives in lakes, ponds, canals, and slow-running rivers with plenty of vegetation. The carp appears to be a native of temperate Asia and perhaps also of south-eastern Europe, and to have been introduced into other parts in the 12th and 13th century; it was first mentioned in England in 1490. The acclimatization of the carp in America has been a great success, especially in the southern states, where, the growth continuing throughout the entire year, the fish soon attains a remarkable size. The presence of carp in Indo-China and the Malay Archipelago is probably also to be ascribed to human agency. In the British Isles the

The Common Carp.

carp seldom reaches a length of 2½ ft., and a weight of 20 lb., whilst examples of that size are quite frequent on the continent, and others measuring 4½ ft. and weighing 60 lb or more are on record. The fish is characterized by its large scales (34 to 40 in the lateral line), its long snout, the first ray of which is stiff and serrated, and the presence of two small barbels on each side of the mouth. But it varies much in form and scaling, and some most aberrant varieties have been fixed by artificial selection, the principal being the king-carp or mirror-carp, in which the scales are enlarged and reduced in number, forming more or less regular longitudinal series on the sides, and the leather-carp, in which the scales have all but disappeared, the fish being covered with a thick, leathery skin. Deformed examples are not of rare occurrence.

Although partly feeding on worms and other small forms of animal life, the carp is principally a vegetarian, and the great development of its pharyngeal apparatus renders it particularly adapted to a granivorous régime. The longevity of the fish has probably been much exaggerated, and the statements of carp of 200 years living in the ponds of Pont-Chartrain and other places in France and elsewhere do not rest on satisfactory evidence.

A close ally of the carp is the Crucian carp, Cyprinus carassius, chiefly distinguished by the absence of barbels. It inhabits Europe and northern and temperate Asia, and is doubtfully indigenous to Great Britain. It is a small fish, rarely exceeding a length of 8 or 9 in. It has many varieties. One of these, remarkable for its very short, thick head and deep body, is the so-called Prussian carp, C. gibelio, often imported into English ponds, whilst the best known is the goldfish (q.v.), C. auratus, first produced in China.

CARPACCIO, VITTORIO, or VITTOR (c. 1455-c. 1522), Italian painter, was born in Venice, c.f an old Venetian family. The facts of his life are obscure, but his principal works were executed between 1490 and 1519, and he ranks as one of the finest precursors of the great Venetian masters. The date of his birth is conjectural. He is first mentioned in 1472 in a will of his uncle Fra Ildio, and Dr Ludwig infers from this that he was born c. 1455, on the ground that no one could enter into an inheritance under the age of fifteen; but the inference ignores the possibility of a testator making his will in prospect of the beneficiary attaining his legal age. Consideration of the youthful style of his earliest dated pictures ("St Ursula" series, Venice, 1490) makes it improbable that at that time he had reached so mature an age as thirty-five; and the date of his birth is more probably to be guessed from his being about twenty-five in 1490.

What is certain is that he was a pupil (not, as sometimes thought, the master) of Lazzaro Bastiani, who, like the Bellini and Vivarini, was the head of a large atelier in Venice, and whose own work is seen in such pictures as the "S. Veneranda" at Vienna, and the "Doge Mocenigo kneeling before the Virgin" and "Madonna and Child" (formerly attributed to Carpaccio) in the National Gallery, London. In later years Carpaccio appears to have been influenced by Cima da Conegliano (e.g. in the "Death of the Virgin," 1508, at Ferrara). Apart from the "St Ursula" series, his scattered series of the "Life of the Virgin" and "Life of St Stephen," and a "Dead Christ" at Berlin, may be specially mentioned.

For an authoritative and detailed account, see the Life and Works of Vittorio Carpaccio, by Pompeo Molmenti and Gustav Ludwig, 4 vols, trans. by R. H. Cust (1907); and the criticism by Roger Fry, "The Venetian Painter and his Critics," in the Quarterly Review (London, April 1908).

CARPATHIAN MOUNTAINS (Lat. Montes Sarmatici; Med. Lat. Montes Nivium), the eastern wing of the great central mountain system of Europe. With the exception of the extreme southern and south-eastern ramifications, which belong to Rumania, the Carpathians lie entirely within Austrian and Hungarian domains, and extend from the Adriatic in the west to the Donautal in the east. They consist of a series of long, high, and very intricately ramified ranges, which are separated by deep valleys, and, in the Austrian part, are connected by narrow mountain passes, with the eastern chain of the Carpathians, but not with the western chain of the Alps. The eastern chain of the Carpathians is the more elevated, and is the chief source of the rivers, which flow eastwards into the black sea. The highest peak is the Caraiman (5844 ft.), in the eastern chain, and the next highest the Bukowina (5800 ft.). The Carpathian range is divided into two principal branches, the inner, or eastern, chain, and the outer, or western, chain. The inner chain consists of a series of long, high, and intricately ramified ranges, which are separated by deep valleys, and, in the Austrian part, are connected by narrow mountain passes, with the eastern chain of the Carpathians, but not with the western chain of the Alps. The highest peak is the Caraiman (5844 ft.), in the eastern chain, and the next highest the Bukowina (5800 ft.). The Carpathian range is divided into two principal branches, the inner, or eastern, chain, and the outer, or western, chain. The inner chain consists of a series of long, high, and intricately ramified ranges, which are separated by deep valleys, and, in the Austrian part, are connected by narrow mountain passes, with the eastern chain of the Carpathians, but not with the western chain of the Alps. The highest peak is the Caraiman (5844 ft.), in the eastern chain, and the next highest the Bukowina (5800 ft.).
Hungarian territory. They begin on the Danube near Pressburg, surround Hungary and Transylvania in a large semicircle, the concavity of which is towards the south-west, and end on the Danube near Osrova. The total length of the Carpathians is over 800 m., and their width varies between 70 and 290 m., the greatest width of the Carpathians corresponding with its highest altitude. Thus the system attains its greatest breadth in the Transylvanian plateau, and in the vicinity of the Tatra region. It covers an area of 75,000 sq. m., and after the Alps is the most extensive mountain system of Europe. The Carpathians do not form an uninterrupted chain of mountains, but consist of several orographically and geologically distinctive mountain systems; in fact they present as great a structural variety as the Alps; but as regards magnificence of scenery they cannot compare with the Alps. The Carpathians, which only in a few places attain an altitude of over 8000 ft., lack the bold peaks, the extensive snow-fields, the large glaciers, the high waterfalls and the numerous large lakes which are found in the Alps. They are nowhere covered by perpetual snow, and glaciers do not exist, so that the Carpathians, even in their highest altitude, recall the middle region of the Alps, with which, however, they have many points in common as regards appearance, structure and flora. The Danube separates the Carpathians from the Alps, which they meet only in two points, namely, the Leoganger and St. Gotthard Mountains at Pressburg, and the Bakony Mountains at Vác (Witzen), while the same river separates them from the Balkan Mountains at Osrova. The March and Oder separates the Carpathians from the Silesian and Moravian chains, which belong to the middle wing of the great central mountain systems of Europe. The Carpathians separate Hungary and Transylvania from Lower Austria, Moravia, Silesia, Galicia, Bukovina and Rumania, while its ramifications fill the whole northern part of Hungary, and form the quadrangular mass of the Transylvanian plateau. Unlike the other wings of the great central system of Europe, the Carpathians, which form the watershed between the northern seas and the Black Sea, are surrounded on all sides by plains, namely the great Hungarian plain on the south-west, the plain of the Lower Danube (Rumania) on the south, and the Galician plain on the north-east.

The Carpathian system can be divided into two groups: the Carpathians proper, and the mountains of Transylvania. The Carpathians proper consist of four main groups, of which the western frontier between Hungary and the adjacent borders of Austria, and of an inner wall which fills the hollow of Upper Hungary, and forms the central group. The outer wall is a complex, roughly circular mass of about 500 m. extending from Pressburg to the valley of the Vis, and the Golden Bistritz, and is divided by the Poprad into two parts, the western Carpathians and the eastern or wooded Carpathians. Orographically, therefore, the proper Carpathians are divided into: (a) the western Carpathians, (b) the eastern or wooded Carpathians, and (c) the central groups.

(a) The western Carpathians, which begin at the Porta Hungaria on the Danube, just opposite the Leitha Mountains, and extend to the Black Sea, consist of four principal groups: the Little Carpathians (also called the Pressburg group) with the highest peak Brado (2670 ft.); the White Carpathians or Mav group, with the highest peak Javorov (3324 ft.), the Zemplin Mountains, formed by the Beskid group, which extends from a little west of the Jablunka pass to the river Poprad, with the highest peaks, Beskid (3115 ft.), Smrk (4395 ft.), Lissa Hora (4350 ft.) and Ossus (5106 ft.); and the Magur or Magura group, which extends to the south of Beskid and Mountains, and contains the Babia Gora (5606 ft.), the highest peak in the whole western Carpathians.

(b) The eastern or wooded Carpathians extend from the river Poprad, to the south of the river Vis, and the Golden Bistritz, whence the Transylvanian Mountains begin, and form the link between these mountains and the central groups or High Carpathians. They are a monotonous sandstone range, covered with extensive forests, but affording a fine road from the Upper Ung to the lower Pass of the world. The southern two-thirds of this range has a mean altitude of 3250 ft., and on its southern portion it attains a mean altitude of 5000 ft. The principal peaks of the Ruoky Put (4294 ft.), Poprad (5900 ft.), Bistra (3206 ft.), Pop Ivan (6214 ft.), Tomatnica (5035 ft.), Giamalu (6077 ft.) and Cserna Gora (6805 ft.), the culminating peak of the whole range. To the eastern Carpathians belong also the range of mountains extending between the Laborecza and the Upper Theiss, called Vihorlat, which attains in the peak of the same name an altitude of 3405 ft. As indicated by its name, which means 'burnt,' it is of volcanic origin, and plays an important part in the folklore and superstitious legends of the Hungarian people.

(c) The central groups or the High Carpathians extend from the confluence of the rivers Arva and Waag to the river Poprad, and include the highest group of the Tatra Mountains. They consist of several mountain groups (see Tatra Mountains), where is found the Gertsdorfer or Franz Joseph peak (Hung. Gerlauchfal-Csúcs), with an altitude of 8737 ft., the highest peak in the whole Carpathian Mountains. On its west and south are the Magur Mountains with the highest peak of the region, the Zipper Magura, which have a mean altitude of 3000 ft. South of the central groups lies a widely extending mountain region, which fills the whole of northern Hungary, and is known as the Hords. It is composed of several groups which are intersected by the valleys of numerous rivers, and which descend in sloping terraces towards the Danube and the Hungarian plain. The principal groups are: the Neutra or Gálc Mountains (5650 ft.), the Súly Mountains, and the Cserei-Tatra, which extends to the south of the High Tatra, and has its highest peaks, the Djemub (6700 ft.) and the Králova Hola (6300 ft.); this group is continued towards the east up to the confluence of the Gompó, and is the Carpathian part of the highest peak the Zalesznik (2765 ft.). West of the Low Tatra extend the Fatra group, with the highest peak, the Great Fatra (5825 ft.), to the south and east of which lie the Schenitz group, the Osornina group of mountains, and a few very high peaks which, as is known, are the Carpathian part of the Hungarian Ore Mountains, on account of their richness in valuable ores. South-east of the Low Tatra extend the Zips—Gömör Ore Mountains, while the most eastern group is the Hegyalja Mountains, which extend from Eperjes to Tokaj. In their northern portion, they are also called Sóvár Mountains, and reach in their highest peak, Simonka, an altitude of 3350 ft., while their southern portion, which ends with the remaining peaks of the Fatra group, is known as the Beskids. The smaller groups of the Hungarian highland are: on the south-west the Neogoris Mountains (2850 ft.), whose offshoots reach the Danube; to the east of them extends the Matra group, with the highest peak called the Sóvár Mountains, which form the highest peak the Széki (5265 ft.). The Matra Mountains are a part of the whole Hungarian plain, and constitute one of the most beautiful groups of the Carpathians; lastly, to its east extend the thickly wooded Bük Mountains (3100 ft.).

Throughout the whole Carpathian system there are numerous mountain lakes, but they cannot compare with the Alpine lakes either in extension or beauty. The largest and most numerous are found in the Tatra Mountains. These lakes are called by the people "eyes of the sea," through their belief that they are in intercommunication with the sea.

The western and central Carpathians are much more accessible than the eastern Carpathians and the Transylvanian Mountains. The principal passades of the transversal routes are: the Passes of Tatra. (5650 ft.), the principal route between Silesia and Hungary, crossed by the Breslau-Budapest railway; and the Jorderpass. In the central Carpathians: from the Fekvas pass to the Galicia, to the Taglós pass over the Králova Hola from the Poprad to the Gran, and the Tylc pass from Bartheld to Tarnow. In the eastern Carpathians: the Dukla pass, the Mezö-Laborc pass crossed by the railway from Ungvar to Sambor; the Verecze pass, crossed by the railway from Lemberg to Munkacs; the Delatyn or Kőrösmecz pass (3300 ft.), also called the Magyart, crossed by the railway from Kolomea to Debrecen; and the Stiborva pass.

The Carpathians consist of an outer zone of newer beds and an inner zone of older rocks. Between the two zones lies a row of Klippen, while towards the Hungarian plain they are covered by deposits of Tertiary age. The outer zone is continuous throughout the whole extent of the chain, and is remarkably uniform both in structure and composition. It is formed almost entirely of a succession of sandstones and shales of the age of the sand—so-called Carpathian Sandstone—and these are thrown into a series of isolated folds dipping constantly to the south. The folding of this zone took place during the Miocene period. The inner zone is much more variable. It is visible only in the west and in the east, while in the central Carpathians, between the Harmad and the headwaters of the Theiss, it is lost beneath the modern deposits of the Hungarian plain. In the western Carpathians the inner zone consists of a series of great old rocks, which were folded and denuded before the deposition of the succeeding strata. In the outer portion of the zone the Permian and Mesozoic beds are crushed and folded against the core of ancient rocks; in the inner portion of the zone they have a little subsequent disturbance. In the eastern Carpathians also, the Permian and Mesozoic beds are not much folded except near the outer margin of the zone. The Klippen are isolated
hills, chiefly of Jurassic limestone, rising up in the midst of the later and softer deposits on the inner border of the sandstone zone. Their relations to the surrounding beds are still obscure. They may be "rootless" masses brought upon the top of the later beds by folding or by the process of sharp anticlinal, which in the process of folding have been forced through the softer rocks which lay upon them. Or, finally, they may have been islands rising above the waters, in which were deposited the later beds which now surround them. The so-called *Krippen* of the Swiss Alps, which lay entirely above the upper surface of the underlying beds, are not strictly analogous, either in structure or in position, with those of the Carpathians. Of all the peculiar features of the Carpathian chain, perhaps the most remarkable is the fringe of volcanic rocks which lies along the base of the ranges in the region of the Pliocene, extending from the Swiss Alps to the Hungarian plateau, and being still more pronounced in the region of the Finkenstein Mountains, which has been preserved and not outlasting the period of folding. They appear to be associated with faulting upon the inner margin of the chain. Traces of such faulting do not occur, and a definite order of succession has been made out in such areas; but this order is not the same throughout the chain.

The Carpathians, like the Alps, form a protective wall to the regions south of them, which enjoy a much milder climate than those situated to the north. The vegetation of these mountain ranges is naturally subjected to the different climatic conditions in which they are found.

The mountains themselves are mostly covered with forests, and their vegetation presents four zones: the beech extends to the base of the slopes of the Pieniny, 1000 ft. higher. Above this grows a species of pine, which becomes dwarfed and disappears at an altitude of about 6000 ft., beyond which is a zone of lichen and moss covered or almost bare rock. The Carpathians are rich in flora, and some of the most luxuriant vegetation of the Carpathian region is found in Transylvania. As regards the fauna, the Carpathians still contain numerous wild animals, which preside a great variety of useful mineral. A great deal of mineral springs and thermal waters are found in the Carpathians, many of which have become frequented watering-places.

The systematic and scientific exploration of the Carpathians dates only from the beginning of the 19th century. The first expedition of the Lomitzer peak in the High Tatras was made by one David or Johann Fröhlich in 1615. The first account of the Tatras Mountains was given by Georg Buchhals, a resident of Készkad in 1645. The English naturalist, Robert Todd, made several of these mountains in 1753. After 1800, a few reliable measurements have been made of the Carpathians.

The first exploration of the Carpathians was undertaken by the ordnance survey of the Austrian army, which published their first map of the central Carpathians in 1801. A great stimulus to the systematic study of the mountains was given by the foundation of the Hungarian Carpathian Society in 1813, and a great deal of information has been added to our knowledge since. In 1880, two new Carpathian societies were formed: a Galician and a Transylvanian.

CARPATHUS. -F.W. Hildebrandt, Karpathenbilder (Glogau, 1863); E. Sagorski and G. Schneider, Flora Carpathorum (2 vols., Leipzig, 1891); Muriel Dowie, A Girl in the Carpathians (London, 1891); Orehygeographische Tafele der Karpathen (Vienna, 1886), in B.M. 28; W. Wartenberg, Der Boden der Karpathen (Vienna, 1886); and W. Rauh, Die Tafeln in Bau und Bild Osterreich (Vienna, 1906). (O. Br.; F. L. A.)

CARPATHUS (Ital. Scarpante), an island about 30 m. southwest of Rhodes, in that part of the Mediterranean which was called, after it, the Carpathian Sea (Carpathium Mare). It was both in ancient and medieval times closely connected with Rhodes; it was held by noble families under Venetian suzerainty, notably the Cornari from 1360 to 1540, when it finally passed into the possession of the Turks. From its remote position Carpathus has preserved many peculiarities of dress, customs and dialect, the last resembling those of Rhodes and Cyprus.

CARPEAUX, JEAN BAPTISTE (1827-1875), French sculptor, was born at Valenciennes, France, on the 11th of May 1827. He was the son of a mason, and passed his early life in extreme poverty. In 1842 he came to Paris, and after working for two years without a salary, was admitted to the École des Beaux-Arts on the 9th of September 1845. The Grand Prix de Rome was awarded to his statue of "Hector bearing in his arms his son Astyanax." His first work exhibited at the Salon, in 1853, did not show the spirit of an innovator, and was very unlike the work of his master Rude. At Rome he was fascinated by Donatello, and yet more by Michelangelo, to whom he owes his feeling for vehement and passionate action. He sent from Rome a bust, "La Palombella," 1856; and a "Neapolitan Fisherman," 1858. This work was again exhibited at the Salon of 1859, and took a second-class medal; but it was not executed in marble till 1863. In his last year in Rome he sent home a dramatic group, "Ugolino and his Sons," and exhibited at the same time a "Bust of Princess Mathilde." This gained him a second-class medal and the favour of the Imperial family. In 1864 he executed the "Girl with a Shell," the companion figure to the young fisherman; and although in 1865 he did not exhibit at the Salon, busts of "Mme. A. E. André," of "Giraud" the painter, and of "Mlle. Benedetti" showed that he was not idle. He was working at the same time on the decorations of the Pavillon de Flore, of which the pediment alone was seen at the Salon, though the bas-relief below is an even better example of his style. After producing a statue of the prince imperial, Carpeaux was made Chevalier of the Legion of Honour, and undertook an important commission to execute one of the four groups for the façade of the new opera house. His group, representing "Dancing," 1869, was greeted with indignant protests; it is nevertheless a sound work, full of movement, with no fault but that of exceeding the limitations prescribed. In 1869 he exhibited a "Bust of M. Garnier," and followed this up with two pieces intended for his native city: a statue of Watteau, and a bas-relief, "Valenciennes repelling Invasion." During the Commune he came to England, and made a "Bust of Gounod" in 1871. His last important work was a fountain, the "Four Quarters of the World," in which the globe is sustained by four female figures personifying Europe, Asia, Africa and America. This fountain is now in the Avenue de l'Observatoire in Paris. Carpeaux, though exhausted by illness, continued designing indefatigably, till he died at the Château de Bécon, near Courbevoie, on the 19th of October 1875, after being promoted to the higher grade of the Legion of Honour. Many of his best drawings have been presented by Prince Stirbey to the city of Valenciennes.

See Ernest Chesneau, Carpeaux, sa vie et son œuvre (Paris, 1886); Paul Fournier, Catalogue du Musée Carpeaux, Valenciennes (Paris, 1882); Jules Clarice, J. Carpeaux (1882); François Bourdain, J. B. Carpeaux (1893).

CARPENARIA, GULF OF, an extensive arm of the sea deeply indenting the north coast of Australia, between 10° 40' and 17° 40' S., and 135° 30' and 142° E. Its length is 480 m. and its extreme breadth (E. to W.) 420 m. It is bounded E. by Cape York Peninsula, and W. by the Northern Territory of South Australia. Near its southern extremity is situated a group of islands called Wellesley; and towards the western side are the Sir Edward Pellew Islands, the Groote Eylandt and others. A large number of rivers find their way to the gulf, and some are of considerable size. On the eastern side there is the Mitchell river; at the south-east corner the Gilbert, the Norman, the Flinders, the Leichhardt and the Gregory; and on the west the Roper river. Jan Carstensz, who undertook a voyage of discovery in this part of the globe in 1623, gave the name of Carpenter to a small river near Cape Duyfken in honour of Pieter Carpenter, at that time governor-general of the Dutch East Indies; and after the second voyage of Abel Tasman in 1644, the gulf, which he had successfully explored, began to appear on the charts under its present designation.

CARPENTER, LANT (1780-1840), English Unitarian minister, was born at Kidderminster on the 2nd of September 1780, the
Carpenter, M._Carpenter, W. B.

son of a carpenter. After some months at a non-conf ormist academy at Northampton, he proceeded to Glasgow University, and then joined the ministry. After a short stay as assistant master at a Unitarian school near Birmingham, he was in 1802 appointed librarian at the Liverpool Athenaeum. In 1805 he became pastor of a church in Exeter, removing in 1817 to Bristol. At both Bristol and Exeter he was also engaged in school work, among his Bristol pupils being Harriet and James Martineau. Carpenter did much to broaden the spirit of English Unitarianism. The rise of baptism seemed to him a superstition, and he substituted for it a form of infant dedication. His health, undermined by his constant labours, broke down in 1830, and he was ordered to travel. He died on the night of the 5th of April 1840, having been washed overboard from the steamer in which he was travelling from Leghorn to Marseilles.

Carpenter, Mary (1807-1877), English educational and social reformer, was born on the 3rd of April 1807 at Exeter, where her father, Dr Lant Carpenter, was Unitarian minister. In 1817 the family removed to Bristol, where Dr Carpenter was called to the ministry of the Lewis's Meeting. As a child Mary Carpenter was unusually earnest, with a deep religious vein and a remarkable thoroughness in everything she undertook. She was educated in her father’s school for boys, learning Latin, Greek and mathematics, and other subjects at that time not generally taught to girls. She early showed an aptitude for teaching, taking a class in the Sunday school, and afterwards helping her father with his pupils. When Dr Carpenter gave up his school in 1829, his daughters opened a school for girls under Mrs Carpenter’s superintendence. In 1833 the raja Rammohun Roy visited Bristol, and inspired Miss Carpenter with a warm interest in India; and Dr Joseph Tuckerman of Boston about the same time aroused her sympathies for the condition of Indian children. Her life-work began with her taking part in organizing, in 1835, a “Working and Visiting Society,” of which she was secretary for twenty years. In 1843 her task in negro emancipation was assumed by a visit from Dr S. G. Howe. Her interest in general educational work was also growing. A bill introduced in this year “to make provision for the better education of children in manufacturing districts,” as a first instalment of a scheme of national education, failed to pass, largely owing to Nonconformist opposition, and private effort became doubly necessary. So-called “Ragged Schools” sprang up in many places, and Miss Carpenter conceived the plan of starting one in Lewin’s Mead. To this was added a night-school for adults. In spite of many difficulties this was rendered a success, chiefly owing to Miss Carpenter’s unwearyed enthusiasm and remarkable organizing power. In 1848 the closing of their own private school gave Miss Carpenter more leisure for philanthropic and literary work. She published a memoir of Dr Tuckerman, and a series of articles on ragged schools, which appeared in the *Inquirer* and were afterwards collected in book form. This was followed by *The Ragged School for the Children of the Poor and the Dif fering Classes*, and for Juvenile Offenders. She sketched out three classes of schools as urgently needed:—(1) good free day-schools; (2) feeding industrial schools; (3) reformatory schools. This book drew public attention to her work, and from that time onwards she was drawn into personal intercourse with leading thinkers and workers. She was consulted in the drafting of educational bills, and invited to give evidence before House of Commons committees. To test the practical value of her theories, she herself started a reformatory school at Bristol, and in 1852 she published *Juvenile Delinquents, their Condition and Treatment*, which largely helped on the passing of the Juvenile Offenders Act in 1854. Now that the principle of reformatory schools was established, Miss Carpenter returned to her plea for free day-schools, contending that the ragged schools were entitled to permanent support from the annual parliamentary grant. At the Oxford meeting of the British Association (1860) she read a paper on this subject, and, mainly owing to her instigation, a conference on ragged schools in relation to government grants for education was held at Birmingham (1861). In 1866 Miss Carpenter was at last able to carry out a long-cherished plan of organizing *Principles of General and Comparative Physiology*. His work in comparative neurology was recognized in 1844 by his election to the Royal Society, which awarded him a Royal medal in 1861; and his appointment as Fullerman professor of physiology in the Royal Institution in 1845 enabled him to exhibit his powers as a teacher and lecturer, his gift of ready speech and luminous interpretation placing him in the front rank of exponents, at a time when the popularization of science was in its infancy. His manifold labours as investigator, author, editor, demonstrator and lecturer knew no cessation through life; but in assessing the value of his work, prominence should be given to his researches in marine zoology, notably in the lower organisms, as Foraminifera and Crinoids. These researches gave an impetus to deep-sea exploration, an outcome of which was in 1868 the “Lightning,” and later the more famous “Challenger” expedition. He took keen and laboured interest in the evidence adduced by Canadian geologists as to the organic nature of the so-called *Eozaon Canadense*, discovered in the Laurentian strata, and at the time of his death had nearly finished a monograph on the subject, defending the now discredited theory of its animal origin. He was an adept in the use of the microscope, and his popular treatise on *The Microscope and its Revelations* (1856) has stimulated a host of observers to the use of the “added sense” with which it has endowed man. In 1856 Carpenter became registrar of the university of London, and held the office for twenty-three years; on his resignation in 1870 he was made a C.B. in recognition of his services to education generally. Biologist as he was, Carpenter nevertheless made reservations as to the extension of the doctrine of evolution to man’s intellectual and spiritual nature. In his *Principles of Mental Physiology* he asserted both the freedom of the will and the existence of the “Ego,” and one of his last public engagements was the reading of a paper in support of miracles. He died in London, from injuries occasioned by the accidental upsetting of a spirit-lamp, on the 19th of November 1875.
CARPENTRAS, a town of south-eastern France, capital of an arrondissement in the department of Vaucluse, 15 m. N.E. of Avignon by rail. Pop. (1866) town, 7,775; commune, 10,721. The town stands on the left bank of the Azun on an eminence, the summit of which is occupied by the church of St. Siffrein, formerly a cathedral, and the adjoining law-court. St. Siffrein, in its existing state, dates from the 15th and 16th centuries and is Gothic in style, but it preserves remains of a previous church of Romanesque architecture. The rich sculpture of the southern portal and the reliefs and works of art in the interior are of some interest. The law-court, built in 1640 as the bishop's palace, contains in its courtyard a small but well-preserved triumphal arch of the Gallo-Roman period. Other important buildings are the hospital, an imposing structure of the 18th century, opposite which is a statue of its founder, Malachie d'Inguimbert, bishop of Carpentras; and the former palace of the papal legate, which dates from 1640. Of the old fortifications the only survival is the Porte d'Orange, a gateway surmounted by a fine machiculated tower. Their site is now occupied by wide boulevards shaded by plane-trees. Water is brought to the town by an aqueduct of forty-eight arches, completed in 1734.

Carpentras is the seat of a sub-prefect and of a court of assizes, and has a tribunal of first instance, communal college for girls and boys, a large library and a museum. Felt hats, confectionery, preserved fruits and nails are its industrial products, and there are silk-works, tanneries and dye-works. There is trade in silk, wool, fruit, oil, &c. The irrigation-canal named after the town flows to the east of it (see VAUCLUSE).

Carpentras is identified with Carpentoracé, a town of Gallia Narbonensis mentioned by Pliny, which appears to have been of some importance during the Roman period. Its medieval history is full of vicissitudes; it was captured and plundered by Vandal, Lombard and Saracen. In later times, as capital of the Comtat Venaissin, it was frequently the residence of the popes of Avignon, to whom that province belonged from 1228 till the Revolution. Carpentras was the seat of a bishopric from the 5th century till 1805.

CARPENTRY, the art and work of a carpenter (from Lat. carpentum, a carriage), a workman in wood, especially for building purposes. The labour of the Sawyer is applied to the division of large pieces of timber or logs into forms and sizes to suit the purposes of the carpenter and joiner. His working-place is called a sawpit, and his most important tool is a pit-saw. A cross-cut saw, axes, dogs, files, compasses, lines, lampblack, blacklead, chalk and a rule may also be regarded as necessary to the joiner. But his method of sawing timber is now only used in remote country places, and in modern practice logs, &c., are converted into planks and small pieces at saw-mills, which are equipped with modern machinery to drive all kinds of circular saws by electricity, steam or gas.

Carpenters' work has been divided into three principal branches—descriptive, constructive and mechanical. The first shows the lines or method for forming every species of work by the rules of geometry; the second comprises the practice of reducing the timber into particular forms, and joining the forms so produced in such a way as to make a complete whole according to the intention or design; and the third displays the relative strength of the timbers and the strains to which they are subjected by their disposition. Here we have merely to describe the practical details of the carpenter's work in the operations of building. He is distinguished from the joiner by his operations being directed to the mere carcass of a building, to things which have reference to structure only. Almost everything the carpenter does in a building is absolutely necessary to its stability and efficiency, whereas the joiner does not begin his operations until the carcass is complete, and every article of joiners' work might at any time be removed from a building without undermining it or affecting its most important qualities. Certainly in the practice of building a few things do occur regarding which it is difficult to determine to whose immediate province they belong, but the distinction is sufficiently broad for general purposes.

The carpenter frames or combines separate pieces of timber by scarifying, notching, crogging, tenoning, pinning and wedging, &c. The tools he uses are the rule, axe, adze, saws, mallets, hammers, chisels, gouges, augers, pickers, set squares, bevels, compasses, gauges, level, plumb rule, jack, trying and smoothing planes, rebate and moulding planes, and gimlets and wedges.

The carpenter has little labour to put on to the stuff; his chief work consists in fixing and cutting the ends of timbers, the labour in preparing the timber being done by machinery.

JOINTS.—The joints in carpentry are various, and each is designed according to the thrust or strain put upon it. Those principally used are the following: lap, fish, scarf, notching, crogging, dovetailing, housing, halving, mortice and tenon, stub.
tenon, dovetailed tenon, tusk tenon, joggle, bridle, foxtail wedging, mitre, birdsmouth, built-up, dowel. Illustrations are given of the most useful joints in general use, and these, together with the descriptions, will enable a good idea to be formed of their respective merits and methods of application.

The lapped joint (fig. 1) is used for temporary structures in lengthening timbers and is secured with iron straps and bolts; a very common use of the lap joint is seen in scaffolding secured with cords and wedges.

The fished joint (fig. 2) is used for lengthening beams and is constructed by butting the ends of two pieces of timber together with an iron plate on top and bottom, and bolting through the timber; these iron connecting-plates are usually about 3 ft. long and ½ in. and ½ in. in thickness. This joint provides a good and cheap method of accomplishing its purpose.

The scarf joint (figs. 3, 4 and 5) is used for lengthening beams, and is made by cutting and notching the ends of timbers and lapping and fitting and bolting through. This method cuts into the timber, but is very strong and neat; in addition for extra strong work an iron fish-plate is used as in the fished joint.

The ends of floor joints and rafters are usually notched (fig. 6) over plates to obtain a good bearing and bring them to the required levels. Where one timber crosses another as in pur-lins, rafters, wood floor girders, plates, &c., both timbers are notched so as to fit over each other; this cogging (fig. 7) serves instead of fastenings. The timbers are held together with a spike. In this way they are not weakened, and the joint is a very good one for keeping them in position.

Dovetailing (fig. 8) is used for connecting angles of timber together, such as lantern curbs or linings, and is the strongest form. When an end of timber is let entirely into another timber it is said to be housed (fig. 9). Where timbers cross one another and require to be flush on one or both faces, sinkings are cut in each so as to fit over each other (halving); these can either be square (fig. 10), bevelled (fig. 11) or dovetailed sinkings (fig. 12). The end of one piece of timber cut so as to leave a third of the thickness forms a tenon, and the piece of timber which is to be joined to it has a mortice or slot cut through it to receive the tenon; the two are then wedged or pinned with wood pins (fig. 13).

A stub tenon or joggle (fig. 14) is used for fixing a post to a sill; a sinking is cut in the sill and a tenon is cut on the foot of the post to fit into the sinking to keep the post from sliding.

The purpose of a dovetailed tenon (fig. 15) is to hold two pieces of wood together with mortice and tenon so that it can be
taken apart when necessary. The tenon is cut dovetail shape, and a long mortice permits the wide part of the tenon to go through, and it is secured with wood wedges. Where the floor joists or rafters are trimmed round fires, soffits, &c., the tenon must be used for securing the trimming joist. It is formed by cutting a tenon on the trimming joist and passing it through the side of the trimming joist and fixing it with a wood key. Where large timbers are tusk tenoned together, the tenons do not pass right through, but are cut in about 4 in. and spiked.

A bridle joint or birdsmouth joint (fig. 17) is formed by cutting one end of timber either V shape or segmental, and morticing the centre of this shaped end. Similar sinkings are cut on the adjoining timber to fit one into the other; these are secured with pins and also various other forms of fastenings. Foxtail wedging (fig. 18) is a method very similar to mortice and tenon. The tenon does not go through the full thickness of the timber; and also on the end of the tenon are inserted two wedges, so that when the tenon is driven home the wedges split it and wedge tightly into the mortice. This joint is used mostly in joinery. The mitre is a universal joint, used for connecting angles of timber as in the case of picture frames. Built-up joints involve a system of lapping and bolting and fishing, as in the case of temporary structures, for large spans of centering for arches, and for derrick cranes. Dowels are usually 3 or 4 in. long and driven into a circular hole in the foot of a door frame or post; the other end is let into a hole in the sill (fig. 19). Centering.—Centering is temporary timber or framing erected so as to carry concrete floors or arches of brick or stone, &c.; when the work has set the centering is removed gradually. The centering for concrete floors is usually composed of scaffold boards resting on wood bearers (fig. 20). One wood bearer rests on top of the steel joists; through this bearer long bolts are suspended, and to the bottom of these bolts a second bearer is fixed, and on the bottom bearer the scaffold boards rest. Another method, not much used now, is to fit the boards to the size of the floor and prop them up on legs, but among other disadvantages this process takes up much space and is more costly.

Turning piece is a name given to centering required for turning an arch over (fig. 21); it is only 4½ in. wide on the sofit or bed, and is generally cut out of a piece of 3 or 4 in. stuff, the top edge being made circular to the shape of the arch. It is kept in position whilst the arch is setting with struts from ground or sills and is nailed to the reveals, a couple of cross traces being wedged between. In the case of a semicircular or elliptical arch with 4½ in. sofit this turning piece will be composed of ribs cut out of 4 in. stuff with ties and braces. Or the ribs could be cut out of 1 in. stuff, in which case there must be one set of ribs outside and one inside secured with ties and braces; each set of ribs when formed of thin stuff is made of two thicknesses nailed together so as to lap the joints. For spans up to 15 ft. the ribs would be used, and for spans above 15 ft. ribs out of 4 in. stuff and upwards. For arches with 9 in. sofit and upwards, whether segmental or semicircular or elliptical, the centres are formed with the thin ribs and laggings up to 15 ft. span; above 15 ft. with 4 in. ribs and upwards (fig. 22). The lower member of centres is called the tie, and is fixed so as to tie the extremities together and to keep the centre from spreading. Where the span is great, these ties, instead of being fixed straight, are given a rise so as to allow for access or traffic underneath. Braces are necessary to support the ribs from buckling in, and must be strong enough and so arranged as to withstand all stresses. Laggings are small pieces or strips of wood nailed on the ribs to form the surface on which to build the arch, and are spaced 1 in. apart for ordinary arches; for gauged arches they are nailed close together and the joints planed off. When centres are required to be taken down, the wedges upon which the centre rests are first removed so as to allow the arch to take its bearing gradually. Centres for brick sewers and vault arching are formed in the same way as previously mentioned, with ribs and laggings, but the thickness of the timbers depends upon the weight to be carried.

Floors.—For ordinary residential purposes floors are chiefly constructed of timber. Up to about the year 1895 nearly every modern building was constructed with wood joists, but because of evidence adduced by fire brigade experts and the serious fires that have occurred fire-resisting floors have been introduced. These consist of steel girders and joists, filled in with concrete or various patented brick materials in accordance with such by-laws as those passed by the London County Council and other authorities. The majority of the floors of public
buildings, factories, schools, and large residential flats are now constructed of fire-resisting materials. There are two descriptions of flooring, single and double.

Single flooring (fig. 23) consists of one row of wood joists resting on a wall or partition at each end without any intermediate support, and receiving the floor boards on the upper surface and the ceiling on the underside. Joists should never be less than 2 in. thick, or they are liable to split when the floor brads are driven in; the thickness varies from 2 to 4 in. and the depth from 5 to 11 in. (see By-laws, below); the distance between each joist is usually 12 in. in the clear, but greater strength is obtained in a floor by having deep joists and placing them closer together. These floors are made firm and prevented from buckling by the use of strutting as mentioned hereafter.

The efficiency of single flooring is materially affected by the necessity which constantly occurs in practice of trimming round fireplaces and flues, and round well holes such as lifts, staircases, &c. Trimming is a method of supporting the end of a joist by tenoning it into timber crossing it; the timber so tenoned is called the trimmer joist, and the timber morticed for the tenon of the trimmer is called the trimming joist, while the intermediate timbers tenoned into the trimmer are known as the trimmed joists. This system has to be resorted to when it is impossible to get a bearing on the wall.

A trimmer requires for the most part to be carried or supported at one or both ends by the trimming joists, and both the trimmer and the trimming joists are necessarily made stouter than if they had to bear no more than their own share of the stress. In the usual practice the trimmer and trimming joists are 1 in. thicker than the common joists, but there are special regulations and by-laws set out in the various districts and boroughs (see By-laws, below) to which attention must be given.

The principal objection to single flooring is that the sound passes through from floor to floor, so that, in some cases, conversation in one room can almost be understood in another. To stop the sound from passing through floors the remedy is to pug them (fig. 24). This consists in using rough boarding resting on fillets nailed to the sides of the joists about half-way up the depth of the joists, and then filling in on top of the boarding with slag wool usually 3 in. thick. Also to further prevent sound from passing through floors the flooring should be tongued and the ceiling should have a good thick floating coat; in poor work the stuff on ceilings is very stinted. In days gone by, ceiling joists were put at right angles to the floor joists, but this took up head room and was costly, and the arrangement is obsolete.

Double flooring (fig. 25) consists of single fir joists trimmed into steel girders; in earlier times a double floor consisted of fir joists called binding, bridging and ceiling joists, but these are very little used now and the single fir joists and steel girders have taken their place. Steel girders span from wall to wall, and on their flanges are bolted wood plates to receive the ends of the single joists which are notched over plates and run at right angles to the
girders (fig. 26). The bearings of the joists on the wall also rest on wall plates, so as to get a level bed, and are sometimes notched over them. Wall plates, which are usually 

4½ in. X 3 in. and are bedded on walls in mortar, take the ends of joists and distribute the weight along the wall. The plates bolted on the side of girders are of sizes to suit the width of the flanges.

The medieval floor (fig. 27) consisted of the framed floor with wood girders, binding, bridging and ceiling joists, and the underside of all the timbers was usually wrought, the girders and binders being boldly moulded and the other timbers either square or stop chamfered.

Flooring is strengthened by the use of strutting, either herring-bone (fig. 28) or solid (fig. 29). Herring-bone strutting consists of two pieces of timber, usually 2 in. X 2 in., fixed diagonally between each joist in continuous rows, the rows being about 6 ft. apart. Solid strutting consists of 1½ in. boards, nearly the same depth as the joists and fitted tightly between the joists, and nailed in continuous rows 6 ft. apart. Where heavy weights are likely to be put on floors long bolts are passed through the centre of joists at the side of the wall since this draws the strutting tightly together and does not produce any force stress on the walls, it is undoubtedly the best method.

Floors are usually constructed to carry the following loads (including weight of floor):—

- Residences, 1½ cwt. per foot super of floor space.
- Public buildings, 1½ cwt. per foot super of floor space.
- Factories, 2½ to 4 cwt. per foot super of floor space.

Local Bye-laws.—With regard to floor joists in domestic buildings the following rules are in force in the Hornsey district, in the north of London. The size of every common bearing floor joist up to 3 ft. long in clear shall be 3 in. X 2½ in.; from 3 ft. to 6 ft. in clear shall be 4½ in. X 3 in.; from 6 ft. to 8 ft., 6½ in. X 2½ in.; from 8 ft. to 12 ft., 7 in. X 2½ in., and so on according to the clear span. The hornsey by-laws with regard to trimmers are as follows:—A trimmer shall not receive more than six common joists, and the thickness of a trimming joist receiving a trimmer at not more than 3 ft. from one end and of every other trimmer shall be 3½ in. of an inch greater than the thickness for a common joist of the same bearing for every common joist carried by a trimmer. For example, if the common joists are 7 in. X 2½ in. and the trimmer has six joists trimmed into same, the size of trimmer would have to be 7 in. X 3½ in. The Hornsey council also requires that the floor boards shall not be less than 3½ in. thick.

There is little difference in the requirements of the various localities. For example, the regulations of the Croydon council require that every common bearing joist for lengths up to 3 ft. 4 in. in clear shall be 3 in. X 2½ in.; for lengths between 3 ft. 4 in. and 5 ft. 4 in., 4 in. X 2½ in.; for lengths between 5 ft. 4 in. and 7 ft. 4 in., 4 in. X 3 in.; and so on according to the clear span. The Croydon by-laws with regard to trimmers are as follows:—A trimmer shall not receive more than six common joists, and the thickness of a trimming joist shall be ¾ in. thicker than that for common joists of the same bearing and the thickness of a trimmer joist shall be ¾ in. thicker for every trimmer trimmed into same than the common joist. For example, if the common joists are 4 in. X 3 in. the trimming joists would have to be 4 in. X 4½ in., and the trimmer joist would have to be 4 in. X 5½ in.

Partitions.—Partitions are screens used to divide large floor spaces into smaller rooms and are sometimes constructed to carry the floors above by a system of trussing. They are built of various materials; those in use now are common stud partitions, bricknogged partitions, and solid deal and hardwood partitions, 4½ in. brick walls or bricks laid on their sides, so making a 3 in. partition, and various patent partitions such as coke breeze concrete or hollow brick partitions (see Brickwork), iron and wire partitions, and plaster slab partitions (see Plasterwork).

There are two kinds of stud or quarter partitions, common and trussed.

Common partitions (fig. 30) simply act as a screen to divide one room from another, and do not carry any weight. They weigh about 25 lb. per square foot of surface, including plastering on both sides, and are used on roofs of 4 in. X 3 in. joists, head and sill, 4 in. X 2 in., upright studs; 4 in. X 2 in. noggings are fitted between the studs to keep them from bending in, and are placed parallel with the head, usually 4 ft. apart. Where door-openings occur in these partitions the studs next the opening are 4 in. X 3 in. Should the floor boards have been laid, the sill of the partition would be laid directly on them, but if the partitions are erected at the time of building the structure the sill should either rest directly over a joist, if parallel with it, or at right angles to the joists; should the position of the sill come between two joists, that is, parallel with them, then short pieces called bridging pieces of 4 in. X 2 in. stuff are wedged between the two joists and nailed to carry the sill.

Trussed partitions (fig. 31) are very similar to the last, but they are so built as to carry their own weight and also to support floors, and in addition have braces; the head and sill are larger, and calculated according to the clear bearing and the weight put upon them. There are two forms of trussing, namely, queen post (fig. 32) and king post (fig. 33).

Bricknogged partitions are formed in the same manner as the common stud partition, except that the studs are placed usually 18 or 27 in. apart in the clear instead of 12 in. and the 18 in. and 27 in. widths being multiples of a brick dimension, they are filled in with brickwork 4½ in. thick and always built in cement. These are used to prevent the sound from passing from one room to another, and are also to prevent fire from spreading, and are vermin-proof. Another method is to fill the space between the studs with coke breeze concrete instead of brickwork.

Timber partitions have the advantages that they are light and cheap and substantial, and the disadvantages that they are not fire-resisting or sound-resisting or vermin-proof; they should never be erected in damp positions such as the
in a public building the London Building Act requires them to be of 2 in. hardwood, with only small panels of fire-resisting glass.

Timber Work.—Half timber work consists of a framework of timber; the upper storeys of suburban and country residences are often thus treated, and the spaces between the timbers are filled in with brickwork and plastered inside, and rough cast outside, though sometimes tiles are hung on the outside. In some instances in country places there is no filling between the timbers, and both sides are lath and plastered, and in others the timbers are solid, or facing pieces are simply plugged to the walls, the joints being pinned with hardwood pins. Half timber work (fig. 34) well designed has a very pleasing, homely and rural effect. The best and most durable wood to use is English oak worked smooth on the external face and usually painted; the by-laws of various authorities differ considerably as to the method of construction and in the restrictions as to its use. Some very fine early examples are to be seen in England, as at Holborn Bars, London, in the old parts of Bristol, and at Moreton Old Hall, near Congleton, Cheshire (see House, Plate IV. fig. 13).

Timber-framed permanent buildings are not used in the towns of England, not being allowed by the by-laws. In some English villages timber bungalows are allowed, plastered inside, and either rough cast outside, or with tiles, or with sheet iron painted.

At the garden city of Letchworth, in Hertfordshire, there are a few timber-framed bungalows (erected about 1904 and originally intended to be used as week-end cottages), the outsides of which are covered with sheet iron and painted. Other instances of the temporary use of this kind of building are found in soldiers' barracks, offices and chapels.

In America and the British colonies this class of building is very largely erected on the outskirts of the cities. In American practice in framing the walls of wooden buildings two distinct methods are used and are distinguished as "braced" and "balloon."

The Braced (fig. 35) was the only kind in use previous to about the year 1850. In this method of framing the sills, posts, girts and plates are made of heavy timber morticed and pinned together and braced with 4 in. × 4 in. or 4 in. × 6 in. braces and common studding. To frame a building in this way it is necessary to cut all the pieces and make all the mortice holes on the ground, and then fit them together and raise a whole side at a time or at least one storey of it. The common studs are only one storey high.

The Balloon frame (fig. 36) is composed of much smaller scantlings and is more rapidly erected and less expensive. The method is to first lay the sill, generally 4 in. × 6 in., halved at the angles. After the floor is laid, the corner posts, usually 4 in. × 6 in., are erected and temporarily secured in place with the aid of stays. The common studs are then set
CARPET

up and spiked to the sill, and a temporary board nailed across their face on the inside. These common studs are the full height from sill to roof plate, and the second tier of floor joists are supported by notching a 1/2 in. X 7 in. board, called a false girt or ribbon, into their inside edge at the height to receive the floor joists. The ends of the joists are also placed against a stud and spiked. The tops of the studs are cut to a line, and a 2 in. X 4 in. plate is spiked on top, an additional 2 in. X 4 in. plate being placed on the top of

the last breaking joint. Should the studs not be long enough to reach the plate, then short pieces are fitted on with pieces of wood spiked on both sides. The diagram shows a portion of the framework of a two-storey house constructed in the manner described. In the balloon frame the timbers are held together entirely by nails and spikes, thus permitting them to be put up rapidly. The studs are doubled where windows or openings occur. In both these methods dwarf brick foundations should be built, upon which to rest the sill. For buildings of a superior kind a combination of the braced and balloon frames is sometimes adopted.

The sides of frame buildings are covered with siding, which is fastened to a sheathing of rough boards nailed to the studs. The siding may consist of matched boards placed diagonally, or of clapboards or weather boards—which are thin boards thicker at one edge than the other, and arranged horizontally with the thick edge downwards and overlapping the thin edge of the board below. Shingles or wooden tiles are also employed.

(Carpentry, the name given to any kind of textile covering for the ground or the floor, the like of which has also been in use on couches and seats and sometimes even for wall or tent hangings or curtains. In modern times, however, carpet usually means a patterned fabric woven with a raised surface of tufts (either cut or looped), and used as a floor covering. Other floor coverings are and have been made also without such a tufted surface, and of these some are simple shuttle-woven materials plain or enriched with needlework or printed with patterns; others are woven after the manner of tapestry-weaving (see Tapestry) or in imitation of it, and a further class of carpets is made of felt (see Felt). This last material is entirely different from that of shuttle or tapestry weaving. Although carpet weaving by hand is, and for centuries has been, an Oriental industry, it has also been, and is still, pursued in many European countries. Carpet-weaving by steam-driven machinery is solely European in origin, and was not brought to the condition of meeting a widespread demand until the 19th century.

In connexion with the word "carpet" (Lat. *carpita*, rug; O. Fr. *carpié*) notice may be taken of the Gr. τάπης and the Lat. *tapetum*, whence also comes the Fr. *tapiss* (the present word for "carpet") as well as our own word "tapestry." This latter, though now more particularly descriptive of hangings and curtains woven in a special way, was, in later medieval times, indiscriminately applied to them and to stuffs used as floor and seat coverings. From a very early period classical writers make mention of them. In ancient Egypt, for instance, floor and seat coverings were used in temples for religious ceremonies by the priests of Amen Ra: later on they

were used to garnish the palaces of the Pharaohs. If one may judge from rare remains of decorative textiles, in the museum at Cairo especially, dating from at least 1480 B.C., such Egyptian fabrics were of linen inwoven with coloured wools in a tapestry-weaving manner, and were not tufted or piled textures. Taken from the palace at Nineveh is a large marble slab carved in low relief with a geometrical pattern surrounded by a border of lotus flowers and buds, evidently a copy of an Assyrian floor cover or rug about 705 B.C., such as was also woven probably in the tapestry-weaving manner. On the other hand, its design equally well suggests patchwork—a method of needlework in vogue with Egyptians, at least 900 years B.C., for ornamental purposes, as indicated by the elaborately patterned canopy which covered the bier of an Egyptian queen—the mother-in-law of Shishak who took Jerusalem some three or four years after the death of Solomon—and is preserved in the museum at Cairo. In the Odyssey, tapestra are frequently mentioned, but these again, whether floor coverings or hangings, are more likely to have been flat-textured and not piled fabrics. On the tomb of Cyrus was spread a "covering of Babylonian tapestry, the carpets underneath of the finest wrought purple" (Arrian vi. 29). Athenaeus (bk. v. ch. 27) gives from Callixenus the Rhodian (c. 380 B.C.) an account of the Palace of King Ptolemy philopator in Alexandria, and describes "the purple carpets of finest wool, with the pattern on both sides," as well as "handsomely embroidered rugs very beautifully elaborated with figures"; these again were probably not piled fabrics but kindred to the hangings in the palace of Ptolemy Philadelphia decorated with portraits, which were likely to have been tapestry-weaving, and would be nearly the same in appearance on both sides of the fabric. Of corresponding tapestry woven work are Egyptian-Roman specimens dating from the 2nd or 3rd century A.D., a considerable collection of which is in the Victoria and Albert Museum at South Kensington. From about the same period date bits of hangings or coverings woven in linen, over-woven in a method of needlework with ornament of compact loops of worsted (Plate I. figs. 1 and 2). These are the earliest extant specimens of textiles presenting a tufted or piled surface very kindred to that of woven pile carpets of much later date. But the modus operandi in producing the earlier only remotely corresponds with that of the later—though making a surface of loops by means of needlework as in the Coptic or Egyptian-Roman speciments (Plate I. figs. 1 and 2) seems to be a progress towards the introduction at an apparently later date of tufts into loom weavings such as we find in 16th-century tufted or piled carpets.

The simple traditional Oriental method of making these latter is briefly as follows:—The foundation is a warp of strong cotton or hempen or woollen or silk threads, the number of which is regulated by the breadth of the carpet and the fineness or coarseness to be given to its pile. Short lengths of coloured wool or goats’ or camels’ hair or silk are knotted on to each of the warp threads so that the two ends of each twist or tuft of coloured yarn, of whatever material it is, project in front. Across the width of the warp and above the range of tufts a weft thread is run in; another line or row of tufts is then knotted, and above this another weft thread is run in across the warps, and so on. These rows of tufts and weft as made are compressed together by means of a blunt fork or rude comb-like instrument, and thus a compact textile with a pile or tufted surface is produced; the projecting tufts are then cut, or cut off to an equal length, and have their ends either stand upright upon, or are level with, the ground. They are easily transported and put together, and the weaving in them is done chiefly by wandering groups of weavers. The local surroundings, often those of rocky arid districts, in which Kurdish and other families weave carpets are well illustrated in Oriental Rugs by J. H. Mumford. For making pile carpets and rugs two traditional knots are in use; the first is termed the Turkish or Ghiordes knot, from Ghiordes, an old city not far from Brussa. It is in vogue principally throughout Asia Minor, as far east as Kurdistan and the Caucasus, but it is also used farther south-east in parts of Persia and India. The yard of the pile is knotted in short lengths upon the warp-threads so that the two outstanding ends of each knot alternate with every two threads of the warp. The second traditional knot is the Persian or Sehna knot, which, though better calculated to produce a close, fine, even, velvety surface, has in many parts of Persia been abandoned for the Ghiordes knot, which is a trifle more easily tied. The Persian or Sehna knot is tied so that from every space between the warp-threads one end of the knot protrudes. The number of knots to the inch tied according to either the Turkish or Persian method is determined by the size and closeness of the warp-threads and the size and number of weft-threads thrown across after each row of knots. The patterns of the fabrics made by country weavers are usually taken by them from old rugs. But in towns where weaving is conducted under more organized conditions new patterns are often devised, and are traced sometimes upon great cardboards, on which the stitches, or knots, are indicated by squares each painted in its proper colour. In some of the Persian carpets and rugs made at Sehna, Kirman and Tabriz, the warp is of silk, a material that contributes to fine compact pile textures.

There is much uncertainty as to the period when cut pile carpets were first made in the East. Their texture is certainly akin to that of fustian and velvet; while that of the finer Persian carpets, which were not made much earlier than about the 15th century, is practically not distinguishable from velvet, having long or heavy pile. Fustian, the English name for a cut short pile textile, is derived from Fostat (old Cairo), and such material is likely to have been made there, as soon as anywhere else, by Saracens, especially during the propitious times of the Fatimite Khalifs, who for more than two centuries previously to the 13th century were noted for the encouragement they gave to all sorts of arts and manufactures. It seems that velvet came into use in Europe not much earlier than the 14th century, and various French church inventories of the time contain entries of "tapis velux (cut pile carpets) d’autre mer, à metre par terre" (see Essai sur l’histoire des tapisseries et tapis, by W. Chocquie, Paris, 1863, pp. 22–23). It is an open question if the making of cut pile carpets in Persia or by Saracens elsewhere preceded that of fustians and velvets or whether the developments in making the three proceeded pari passu.

The making of carpets with a flat surface, however, is probably far older than that of cut pile carpets, and characteristic of one such old method is that in the making of Soumak carpets (Plate II. fig. 5), the ornament of which done in close needle stitches with coloured threads completely conceals the stout flax or hemp web which is the essential material of these carpets. Soumak is a distortion of Shemaka, a Caucasian town in the far east of Asia Minor. But so-called Soumak carpets are made in other districts, and the particular needlework used in them is practically of the same kind as that on a smaller scale used for the well-known Persian Nakhe or woman’s tussuring, and again that used on a still smaller scale in the ornamentation of valuable Kashmir shawls. Quilted and chain-stitch-clothed cotton prayer and bath rugs from Persia are referred to in the article on Embroidery.

Another method of making carpets with a flat surface is that of tapestry-weaving (see Plate II. fig. 4), which, according to existing and well-authenticated specimens of considerable breadth (already referred to), appears to be the oldest of any historic process of ornamental weaving (see Tapestry).

Very broadly considered, the traditional designs or patterns of Oriental carpets fall into two classes: the one, prevailing to a much larger extent than the other, seems to reflect the austerity of the Sunni or orthodox Mahomedans in making patterns with abstract geometric and angular forms, stiff interlacing devices, cryptic signs and symbols and the like; whilst the other suggests the freer thought of the Shiah or unorthodox sect, in
designs of ingenious blossom and leafy scrolls, conventional arabesques, botanical and animal forms, and cartouches enclosing Kufic inscriptions (see the splendid example known as the Ardebil carpet, Plate III. fig. 7, and another in Plate IV. fig. 9). Types of the more austere design occur in carpets from Afghanistan, Turkestan, Bokhara and Asia Minor, N.W. India and even Morocco, the other types of freer design being almost special to Persian rugs and carpets.

Next in historic importance to Persia, Turkestan and Asia Minor is India, where the making of cut pile carpets—known as Kalin and Kalicha—was presumably introduced by the Mahomedans during the latter part of the 14th century. But the industry did not apparently attain importance until after the founding of the Mogul dynasty by Baber early in the 16th century. The designs mainly derived from those of Persian carpets of that period do not as a rule rise to the excellence of their prototypes. Historical centres of Indian carpet making are in Kashmir, the Punjab and Sind, and at Agra, Mirzapur, Jububpore, Warangal in the Deccan, Malabar and Masulipatam. Velvets are richly embroidered in gold and silver thread at Benares and Murshidabad and used as ceremonial carpets, and silk pile carpets are made at Tanjore and Salem. For the most part the best of the Indian cut pile carpets have been produced by workers who have been employed by princes, great nobles and wealthy persons to carry on the craft in their dwellings and palaces. These groups of highly skilled workmen as parts of the household staff were paid fixed salaries, but they were also allowed to execute private orders. During the 16th century the carpet industry was developed in government, chasing, and producing in quantities the prison-made carpets as a rule less well turned out, and the competition, set up between them and the rugs and carpets of private factories has had a somewhat detrimental effect upon the industry generally. Older in origin than the cut pile carpets are those of thinner and flat surface texture, which from almost immemorial times have been woven in cotton with blue and white or red and stripes in the simplest way. These are called *doris* and *satarannis*, and are made chiefly in Benares and northern India. They are also made in the south and by such aborigines retaining primitive habits as the Todas of the Nilgiri Hills, a fact which points to the age of this particular method of making ground or floor coverings.

A condition that has always controlled the designs of Oriental carpets is their rectangular shape, more often oblong than square. As a rule there is a well-schemed border, enclosing the main portion or field over which the details of the pattern are symmetrically distributed. Simpler patterns in the field of a carpet or rug consist of repetitions of the same device or of a small number of different devices (see Plate II. fig. 4). Richer patterns display more organic pattern in the construction, of which the leading and continuous features are expressed as diversified bands, scrolls and curvilinear stems; amongst these latter are very varied devices which play either predominant or subordinate parts in the whole effect of the design (Plate III. fig. 7). Angular and simplified treatments of these elaborate designs are rendered in many Asia Minor or Turkey carpets (Plate I. fig. 3); but the typical flowing and more graceful versions are of Persian origin (see Plate III. fig. 7, and Plate IV. fig. 9), usually of the 16th century. Mingled in such intricate stem designs or "arabesques" are details of which have been derived on the one hand from Persian art and even from very early Mesopotamian embossed metal work of the 12th and 13th centuries before its occurrence in Persian carpet designs, the finest of which were produced about the reign of Shah Abbas. A good deal earlier than this period are carpets designed chiefly according to the simpler taste of the Sunnites, and such as these appear to be mentioned by Marco Polo (1256-1323) when writing that "in Turcomania they weave the handsomest carpets in the world." He quotes Conia (Coniah in Anatolia), Savast (Sivas in Asia Minor), some 300 m. north-east of Conia, and Cassaria (Kaisaria or Caesarea in Anatolia) as the chief weaving centres. It is the carpets from such places rather than from Persia that appear to have been the first Oriental ones known in Europe.

Entries of Oriental carpets are frequent in the inventories of European cathedral treasures. In England, for instance, carpets are said to have been first employed by Queen Eleanor of Castile and her suite during the latter part of the 13th century, who had them from Spain, where their manufacture was apparently carried on by Saracens or Moors in the southern part of the country. On the other hand, Pierre Dupont, a master carpet-maker of the Savonnerie (see below), gives his opinion in 1632 that the introduction of carpet-making into France was due to the Saracens after their defeat by Charles Martel in A.D. 732. But more historically precise is the record in the *Bocage* of crafts (Livre des métiers) by Etienne Boileau, proof of the merchants in Paris (1525-1626), of "the tapissiers or makers of tapiss sarrasinois," if they say that their craft is for the service only of churches or great men like kings and nobles. In the 13th and 14th centuries Saracen weavers of rich and ornamental stuffs were also employed at Venice, which was a chief centre for importing Oriental goods, including carpets, and distributing them through western Europe. Dr Bode, in his *Vorderasiatische Knüpfeppiche*, instances Oriental carpets with patterns mainly of geometric and angular forms represented in frescoes and other paintings by Domenico di Bartolo (1440), Niccolo di Buonaccorso (1450), Lippo Memmi (1450) and others.

Of greater interest perhaps, and especially as throwing light upon the trade in, if not the making of, carpets in England somewhat in the method of contemporary Turkey carpets, is the specimen represented in Plate III. fig. 6. This may have been made in England, where foreign workmen, especially Flemings, were from early times often encouraged to settle in order to develop industries, amongst which wool carpet-making probably and tapestry-weaving certainly were included. The earliest record of important weaving works in England is that of William Sheldon's at Barcheston, Warwickshire, in 1509, and, besides wall hangings, carpets of tapestry-weaving were also possibly made there. The cut pile carpet belonging to Lord Verulam (Plate III. fig. 6) was perhaps made at Norwich. It has a repeating and simply contrived continuous pattern of ornamental interweaving stems with a large lozenge in the centre bearing the royal arms of England with the letters E. R. (Elizabeth Regina) and the date 1570. It also has the arms of the borough of Ipswich and those of the family of Harbottle. The sequence or continuity of its border pattern falls in the corners at one end of the rug or carpet in a way very common to many Asia Minor and Spanish carpets (see Plate I. fig. 3, Plate II. fig. 4, and Plate IV. fig. 10); not, however, to the majority of Persian carpets (see Plate III. fig. 7, and Plate IV. fig. 8). A large cut pile carpet in the Victoria and Albert Museum has a repeating pattern of star devices, rather Moorish in style, with the inscription on one end of the border saying "Feare God and Keep His Commandments," made in the year 1603, and in the field the shield of arms of Sir Edward Apsley of Thakeham, Sussex, inscribing those of his wife, Elizabeth Elmes of Lilford, Northamptonshire. This may have been made in England. A carpet of very similar design, especially in its border, is to be seen in a painting by Marc Gheeraerts of the conference at old Somerset House of English and Spanishplenipotentiaries (1604), now in the National Portrait Gallery, London. A more important and

1 The *tapissiers sarrasinois* were apparently the makers of piled or velvety carpets, and have always been written about in contradistinction to the *tapissiers de haute lisse or tapissiers nostres*, who it appears did not weave piled or velvety material, but made tapestry-woven hangings and coverings for furniture.  

2 In Haklaye's *Yowges* mention is made of directions having been given to Morgan Hubblethorne, a dyer, to proceed (about 1570) to Persia to learn the arts of dyeing and of making carpets.
finer carpet belongs to the Girdler's Company (Plate IV. fig. 8), and is of Persian design, into which are introduced the arms of the company; shields with eagles, and white panels with English letters, the monogram of Robert Bell the master in 1634, but this was made at Lahore\(^1\) to his order.

Before dealing with later phases of the carpet industry in England, mention may now be made of Spanish carpets, of European as distinct from Saracen or Persian design; the making of them dates at least from the end of the 15th century or the beginning of the 16th century. It is only within recent years that specimens of them have been obtained for public collections, and at present little is known of the factories in Spain whence they came. A large and most interesting series is shown in the Victoria and Albert Museum, and a portion of one of the earlier of the Spanish cut pile carpets in that museum is given in Plate IV. fig. 10. The inner repeating pattern has suggestions of a lingering Moorish influence, but a superior version of it with better definition is to be seen in extant bits of Spanish shuttle-woven silks of the 16th century. The border of distorted dragon-like creatures is of a Renaissance style, and this style is more pronounced in other Spanish carpets having borders of poorly treated Italian 16th-century pilaster ornament. Beside cut pile, many Spanish carpets of the 17th and 18th centuries have looped and flat surfaces, and bear inscriptions, many too are of needlework in tent or cross stitch.

Another interesting class of very fine pile carpets that has also become known comparatively recently to collectors is the so-called Polish carpets, generally made of silk pile for the ornament, which is distinctively Oriental, and of gold and silver thread textile for the ground, very much after the manner of early 17th-century Brusa fabrics. Many of these carpets are in the Czartoryski collection at Cracow. They are discussed by Dr Bode in his treatise on Oriental carpets already referred to. European coats of arms of the persons for whom they were made are often introduced into them, sometimes different in workmanship from that of the carpets, though there are specimens in which the workmanship is the same throughout. The details of their designs consist for the most part of arabesques and long curved serrated leaves similar to such as are commonly used in Rhodian pottery decoration of the 16th century, though more typical of those so frequent in 17th-century Turkish ornament. Various considerations lead to the conclusion that these so-called Polish carpets were probably made in either Constantinople or Damascus (tapete Damascini frequently occur in Venetian inventories of the 16th century) rather than, as has been thought, by the Persian workmen employed at the Mazarski silk factory which lasted for a short period only during the 18th century at Sleucz in Poland.

The European carpet manufactory, of which a continuous history for some two hundred and fifty years is recorded with exceptional completeness, is that which has been maintained under successive régimes, royal, imperial and republican, in France—at the Hôtel des Gobelins in Paris. Seventy years before its organization under Colbert in 1667 as a state manufactory (Manufacture Royale des Meubles de la Couronne), Henry IV. had founded royal art workshops for all sorts of decorative work, at the Louvre; and here in 1604 a workroom was established for making Oriental carpets by the side of that which existed for making tapis flamans. In 1610 letters patent were granted to the Sieur Fortier, who has been reputed to be the first inventor in France of Turkish making in silk. In 1676, and then in 1740, the Fine East India Company ordered carpets with gold thread, which must have been sumptuous fabrics probably resembling the so-called Polish carpets of this date. Some ten years later it is recorded that Pierre Dupont and Simon Lourdaret first made a pile carpet (tapis veloutés) manufactory at Chaiollot (Paris) in large premises which had been used for the manufacture of soap—whence the name of "Gobelinne." To this converted manufactory were transferred in 1631 the carpet-

\(^{1}\) The Royal Factory at Lahore was established by Akbar the Great in the 16th century.

\(^{2}\) A wealthy serge-maker of Swiss nationality, who had been settled for some years in Exeter, and bought up the plant of Parissot's Exeter works. (See Bulletin de la société de l'histoire de l'art français, p. 97, vol. 1875 to 1878.)
carpet carried on at Axminster died towards the end of the 18th century, and the name of Axminster like that of Savonnerie carpets now perpetuates the memory of a locally deceased manufacturer, much as in a parallel way Brussels carpets seem to owe their name to the renown of Brussels as an important centre in the 17th and 18th centuries for tapestry-weaving.

Before the existence of steam-driven carpet-making machinery in England, employers, following the example set by the French, applied the Jacquard apparatus, for regulating and facilitating the weaving of patterns, to the hand manufacture of carpets. This was early in the 19th century; a great acceleration in producing English carpets occurred, severely threatening the industry as pursued (largely for tapis rôs) at Tournai in Belgium, at Nîmes, Abbeville, Aubusson, Beauvais, Tourcoing and Lamoy in France. The severity of the competition, however, was still more increased when English enterprise, developing the inventions of Erastus B. Bigelow (1814–1879) of America and Mr William Wood of England, took the lead in perfecting Jacquard weaving carpet looms worked by steam, which resulted in the setting up of many power-loom carpet manufactories in the United Kingdom. It was not until 1880 that French pile carpet manufacturers began to adopt similar carpet power-loom, importing them from England.

These machines for weaving pile carpets, either looped (bouclê) as in Brussels, or cut (veloutê) as in Wilton or Axminster carpets, were similar in all respects to such as had been in use by the important English manufacturers—Crossley of Halifax, Templeton of Glasgow, Humphreys of Kidderminster, Southwell of Bridgnorth, and others. A so-called tapestry carpet weaving-loom was invented by Richard Whytock of Edinburgh in 1832, but it was not brought to sufficient completeness for sustained manufacture until 1855. The essential feature of Mr Whytock's process was that the warp-threads were dyed and parti-coloured, in such a way that when woven the several points of colour formed the pattern of the whole fabric. Although the name "tapestry" is used, the texture of these wares has but a remote likeness to that of hand-made tapestry hangings and carpets such as those of the Gobelins and Aubusson manufactories, nor is it the same as the texture of Brussels carpets. Machine-made tapestry carpets are also called "infrain" carpets, because the wool or worsted is dyed in the grain; i.e., before manufacture. Germany in her manufacture of carpets resorted chiefly to the "infrain" process, but in common with Holland and Belgium she produces pile (looped and cut) carpets from power-looms. In the United States of America there are many similar and very important carpet manufactories; and Austria produces fine cut pile carpets (veloutêts), the designs of which are largely derived from those of the Aubusson tapestry-woven carpets (tapis rôs).

Lengths or pieces of felt and other substantial material are frequently made for floor and stair carpeting, and are often printed with patterns. These of course come into quite another class technically. The technological aspects of the several branches of carpet manufacture by machinery are treated in the articles on Textile-Printing and Weaving. Briefly, the products of carpet manufacture practically fall into three main divisions: (1) Pile carpets (tapis moquettes) which are either looped (bouclê) or cut (veloutê); (2) flat surface carpets (tapis rôs) as in hand tapestry-woven material; and (3) printed stuffs used for carpeting.

Whilst the production of carpets by steam power predominates in Europe and the United States of America, and at one time appeared to be giving the coup de grace to the craft of making carpets by hand, there has been in recent times a revival in this latter, and many carpets of characteristic modern design, several of them made in England, are due to the influence of the late William Morris, who devoted much of his varied energies to tapestry weaving and pile carpet weaving by hand, both of which crafts are being fostered as cottage industries in parts of Ireland, as well as in England. At the same time leading English carpet manufacturers continue to produce hand-made carpets as occasion requires. In France a much more systematic existence of tapestry weaving and pile carpet making by hand has been maintained and is of course attributable to the perennial activity of the state tapestry works in Paris (at the Gobelins workshops) and in Beauvais, and of corresponding works managed by private enterprise at Aubusson and elsewhere.

Designing patterns for English carpet manufacture is now more organized than it was, and greater thought and invention are given to devising ornament suitable to the purpose of floor coverings. Before 1850 and for a few years later, rather rude realistic representations of animals and botanical forms (decadent versions of Savonnerie designs) were often wrought in rugs and carpets, and survivals of these are still to be met with, but the lessons that have been subsequently derived from intelligent study of Oriental designs have resulted in the definite designing of conventional forms for surface patterns. The early movement in this direction owes much to the teaching of Owen Jones, and in its later and rather freer phases the Morris influence has been powerful. Schools of art at Glasgow, at Manchester, Birmingham and elsewhere in the United Kingdom have trained artists to wield the spirit of the past in harmony with modern times, and contributed to the formation of an English style with a new note, which, as a French writer puts it, has created a sensation in France, in Germany, in fact all Europe and America.

France retains that facility of execution and liveliness in invention which have been nurtured for over three hundred years by systematic, governmental solicitude for education in decorative design and enterprise in perfecting manufacture. Her Aubusson and Savonnerie carpets have maintained a style of design in form and colour entirely different from any that clearly throws back to Oriental principles, and many of the designs for the finer and larger of these carpets are schemed with large central oval panels, garlands of flowers and fantastic frames very much on the plan of what is frequently to be seen in the decoration of ceilings. At the same time the style called l'art nouveau has become developed. It largely grows from very fanciful dispositions of free-growing natural forms, as well as the curious and curved, and furnished devices, many of which are bone-like and fibre-like in character, flat in treatment and rather thin and washy in colour, and its influence has slightly percolated into designs for pile carpets. This style, sometimes intermixed with the more robust, less fantastic and rather fuller-coloured English style, has found followers in England, America and Germany, but the bulk of the designs now used in power carpet looms seems to be mainly of Oriental descent.

The more important art museums in Europe contain collections of Oriental carpets, and the history of many is fairly well established. The subject has become one of serious study, the results of which have been published and elucidated by means of well-executed coloured reproductions of carpets and rugs preserved in both public and private collections.

BIBLIOGRAPHY.—(1) An Account of the New Manufactury of Tapestries at the Manufactory of Châtillon, etc., now undertaken at Fulham, by Mr Peter Parisot (London, Dodsley, 1753, 8vo). This is probably the only account of carpet-making in England during the 18th century. It is a collection of documents that are of great value for the purpose of studying the state of the art at that period, and contains a statement that "the Manufacture of Châtillon is altogether of wool, and worked in the manner of Velvet. All sorts of Figures of Men and Animals may be imitated in this work; but Fruits and Flowers answer better; and the present employment for this Art is to make Carpets and all sorts of Screeven." CARPET-BAGGER—CARPINI

CARPET-BAGGER, a political slang term for a person who stands as a candidate for election in a locality in which he is a stranger. It is particularly used of such a candidate sent down by the central party organization. The term was first used in the western states of America of speculative bankers who were said to have started business with no other property than what they could carry in a carpet-bag, and of that sort must we apply it. The carpet-bag was the usual form of use in American politics in the reconstruction period after the Civil War, as a term of contempt for the northern political adventurers in the South who, by the help of the negro vote, gained control of the administration.

CARPET-KNIGHT, properly one who has been knighted in time of peace on the carpet before the king's throne, and not on the field of battle as an immediate reward for valor. It is used as a term of reproach for a soldier who stays at home, and avoids active service and its hardships, with a particular reference to the carpet of a lady's chamber, in which such a fainthearted soldier lingers.

CARPI, GIROLAMO DA (1501-1536), Italian historical and portrait painter, born at Ferrara, was one of Benvenuto Car- falo's pupils. Becoming infatuated with the work of Correggio, he quitted Ferrara, and spent several years in copying that master's paintings at Parma, Modena and elsewhere, succeeding in aping his mannerisms so well as to be able to dispose of his own works as originals by Correggio. It is probable that not a few pictures yet attributed to the great painter are in reality the work of his parasite. Da Carpi's best paintings are a Descent of the Holy Spirit, in the church of St Francis at Rovigo; a Madonna, an Adoration of the Magi, and a St Catharine, at Bologna; and the St George and the St Jerome, at Ferrara.

CARPI, UGO DA, Italian 15th century painter, was long held the inventor of the art of printing in chiaroscuro, afterwards brought to such perfection by Parmigianino and by Baltasar Peruzzi of Siena. The researches of Michael Huber (1727-1804) and Johann Gottlob Immanuel Breitkopf (1710-1794) have proved, however, that this art was known and practised in Germany by Johann Ulrich Pilgrim (Wächtlin) and Nikolaus Alexander Mair (1450-1520), at least as early as 1499, while the date of the oldest of the chiaroscuro woodcuts by Da Carpi is 1518. Printing in chiaroscuro was done by using several blocks: Da Carpi generally employed three—one for the outline and darker shadows, another for the lighter shadows, and a third for the half-tint. By means of them he printed engravings after several pictures and after some of the cartoons of Raphael. Of these a Sybil, a Descent from the Cross, and a History of Simon the Sorcerer are the most remarkable.

CARPI, a Dacian tribe established upon the lower Danube from the 1st century B.C. They rose to considerable power during the 3rd century A.D., and claiming to be superior to the Goths accordingly demanded that their incursions into Roman territory likewise should be bought off by tribute. When this was refused they invaded in force, but were beaten back by the emperor Philip. After this they joined with the Goths in their successful inroads until both nations were defeated by Claudius Gothicus. Later, after repeated defeats under Diocletian and Galerius, they were taken under Roman protection and the greater part established in the provinces of Pannonia and Moesia. Some were left beyond the Danube, and they are last heard of as allies of the Goths and Sciri in the days of Theodosius.

Potamo speaks of Harpai and a town Harpi. This was no doubt the form the name assumed in the mouths of their Geermanic neighbours, Bastarmae and Goths. (E. H. M.)

CARPI, a town and episcopal see of Emilia, Italy, in the province of Modena, 9 m. N.N.W. by rail from the town of Modena. Pop. (1905) 7,118 (town), 27,135 (commune). It is the junction of a branch line to Reggio nell'Emilia via Correggio, and the centre of a fertile agricultural district. Carpi contains several Renaissance buildings of interest, the facade of the old cathedral (an early Romanesque building in origin, with some early 15th century frescoes), the new cathedral (after 1513), perhaps the nave of S. Niccolò and a palace, all being by Baldassare Peruzzi: while the prince's palace (with a good court and a chapel containing frescoes by Bernardino Locchi of Parma, 1498-1540) and the colonnades opposite the theatre are also good. These, and the fortifications, are all due to Alberto Pio of Carpi, a pupil of Aldus Manutius, expelled in 1525 by Charles V., the principality being given to the house of Parma. The Museo di Istoria di Carpi contains a considerable collection of old master's paintings. (A. S. C.)

CARPINI, JOANNES DE PLANO, the first noteworthy European explorer of the Mongol empire (in the 13th century), and the author of the earliest important Western work on northern and central Asia, Russian Europe, and other regions of the Tatar dominion. He appears to have been a native of Umbria, where a place formerly called Pian del Carpine, but now Piano della Magione, stands near Perugia, on the road to Cortona. He was one of the companions and disciples of his countryman St Francis of Assisi, and from sudden inducations he hardly could have been younger than the latter, born in 1182. Joannes bore a high repute in the order, and took a foremost part in the
propagation of its teaching in northern Europe, holding successively the offices of warden (custos) in Saxony, and of provincial (minister) of Germany, and afterwards of Spain, perhaps also in Barbary, and of Cologne. He was in the last post at the time of the great invasion of Eastern Europe, and of the disastrous battle of Liegnitz (April 9, 1241), which threatened to cast European Christendom beneath the feet of barbarous hordes. The dread of the Tatars was, however, still on men's minds four years later, when Pope Innocent IV. despatched the first formal Catholic mission to the Mongols (1245), partly to protest against the latter's invasion of Christian lands, partly to gain trustworthy information regarding the hordes and their purposes; behind there may have lurked the beginnings of a policy much developed in after-time—that of opening diplomatic intercourse with a power whose alliance might be invaluable against Islam.

At the head of this mission the pope placed Friar Joannes, at this time certainly not far from sixty-five years of age; and to his discretion nearly everything in the accomplishment of the mission seems to have been left. The legate started from Lyons, where the pope then resided, on Easter day (April 16, 1245), accompanied by another friar, one Stephen of Bohemia, who broke down at Kanev near Kiev, and was left behind. After seeking counsel of an old friend, Wenceslaus, king of Bohemia, Carpini was joined at Breslau by another Minorite, Benedict the Pole, appointed to act as interpreter. The onward journey lay by Kiev; the Tatar posts were entered at Kanev; and thence the route ran across the Dnieper (Neper, Neppe, Neperius or Nepier) and Carpathi and Benedict) to the Don and Volga (Ethel in Benedict; Carpini is the first Western to give us the modern name). Upon the last-named stood the Ordus or camp of Batu, the famous conqueror of eastern Europe, and the supreme Mongol commander on the western frontiers of the empire, as well as one of the most senior princes of the house of Jenghiz. Here the envoys, with their presents, had to pass between two fires, before being presented to the prince (beginning of April 1246). Batu ordered them to proceed onward to the court of the supreme khan in Mongolia, and on Easter day once more (April 8, 1246) they started on the second and most formidable part of their journey—"so ill," writes the legate, "that we could scarcely sit a horse; and throughout all that went our food had been nought but milk with salt and water, and with only snow melted in a kettle for drink." Their bodies were tightly bandaged to enable them to endure the excessive fatigue of this enormous ride, which led them across the Jace or Ural river, and north of the Caspian and the Aral to the Jaxartes or Syr Daria (quidam fluvius magnus cuius nomen ignorantum), and the Mohommedan cities which then stood on its banks; thence along the bournes of the Dzungarian lakes; and so forward, till, on the feast of St Mary Magdalene (July 22), they reached at last the imperial camp called Sira Orda (i.e. Yellow Pavilion), near Karakorum and the Orkhon river—this stout-hearted old man having thus ridden something like 3000 m. in 106 days.

Since the death of Okkodai the imperial authority had been in interregnum. Kuyuk, Okkodai's eldest son, had now been designated to the throne; his formal election in a great Kurultai, or diet of the tribes, took place while the friars were at Sira Orda, along with 3000 to 4000 envoys and deputies from all parts of Asia and eastern Europe, bearing homage, tribute and presents. They afterwards, on the 24th of August, witnessed the formal enthronement at another camp in the vicinity called the Golden Ordu, after which they were presented to the emperor. It was not till November that they got their dismissal, bearing a letter to the pope in Mongol, Arabic and Latin, which was little else than a brief imperious assertion of the khan's office as the scourge of God. Then commenced their long winter journey homeward; often they had to lie on the bare snow, or on the ground scraped bare of snow with the traveller's foot. They reached Kiev on the 9th of June 1247. There, and on their further journey, the Slavonic Christians welcomed them as risen from the dead, with festivity hospitable. Crossing the Rhine at Cologne, they found the pope still at Lyons, and there delivered their report and the Khan's letter.

Not long afterwards Friar Joannes was rewarded with the archbishopric of Antivari in Dalmatia, and was sent as legate to St Louis. The date of his death may be fixed, with the help of the Franciscan Martyrology and other authorities, as the 1st of August 1252; hence it is clear that John did not long survive the hardships of his journey.

He recorded the information that he had collected in a work, variously entitled in the MSS. Historia Mongalorum quos nos Tartaros appellamus, and Liber Tartarorum, or Tatarorum. This treatise is divided into eight ample chapters on the country, climate, manners, religion, character, history, policy and tactics of the Tatars, and on the best way of opposing them, followed by a single (ninth) chapter on the regions passed through. The book thus answers to its title. Like some other famous medieval itineries it shows an entire absence of a traveller's or author's egotism, and contains, even in the last chapter, scarcely any personal narrative. Carpini was not only an old man when he went cheerfully upon this mission, but was, as we know from accidental evidence in the annals of his order, a fat and heavy man (sir grossis et corpulentus), insomuch that during his preachings in Germany he was said, contrary to Franciscan precedent, to ride a donkey. Yet not a word approaching more nearly to complaint than those which we have quoted above appears in his narrative. His book, both as to personal and geographical detail, is inferior to that written a few years later by a younger brother of his, William of Rubruck, in the employ of Louis IX. It may be ascribed to the reality of his account, and to his sympathy towards the Mongols, William of Rubruck or Rubruquis. But in spite of these defects, due partly to his conception of his task, and in spite of the credulity with which he incorporates the Oriental tales, sometimes of childish absurdity, from which Rubruquis is so free, Friar Joannes' Historia is in many ways the chief literary memorial of European overland expansion before Marco Polo. It first revealed the Mongol world to Catholic Christendom; its account of Tatar manners, customs and history is perhaps the best treatment of the subject by any Christian writer of the middle ages. We may especially notice, moreover, its four name-lists:—of the nations conquered by the Mongols; of the nations which had up to this time (1245-1247) successfully resisted; of the Mongol princes; and of the witnesses to the truth of his narrative, including various merchants trading in Kiev whom he had met. All these catalogues, unrivalled in Western medieval literature, are of the utmost historical value. To the accuracy of Carpini's statements upon Mongol life, a modern educated Mongol, Gaisang Gomboyev, has borne detailed and interesting testimony (see Mélanges asiat., tirs du Bulletin Hist. Philol. de l’Acad. Imp. de St Pétersbourg, ii. p. 659, 1856).

The book must have been prepared immediately after the return of the traveller, for the Friar Salimbeni, who met him in France in the year of his return (1247), gives us these interesting particulars:—"He was a clever and conversable man, well lettered, a great discoursor, and full of a diversity of experience. . . . He wrote a big book about the Tatars (sic), and about other marvels that he had seen, and whenever he felt weary of telling about the Tatars, he would cause that book of his to be read, as I have often heard and seen" ("Chron. Fr. Salimbeni Parmensis" in Monum. Histor. ad Prov. et Placent. pertinentia, Parma, 1857).

For a long time the work was but partially known, and that chiefly through an abridgment in the vast compilation of Vincent of Beauvais (Speculum Historiale) made in the generation following the traveller's own, and printed first in 1473. Hakluyt (1568) and Bergeron (1634) published portions of the original work; but the complete and genuine text was not printed till 1838, when it was put forth by the late M. D'Avezac, an editorial masterpiece, embodied (1839) in the 4th volume of the Recueil de voyages et de mémoires of the Geographical Society of Paris.

Joannes' companion, Benedictus Polonus, also left a brief narrative taken down from his oral relation. This was first published by M. D'Avezac in the work just named.

The following four MSS. may be noticed: (1) "Corpus," i.e. Corpus Christi College, Cambridge, No. 181; (2) "Petan," i.e. Leiden University, 77 (formerly 104)—both these are certainly earlier.
CARPOCRATES—CARRANZA

than 1300; (3) "Colbert," i.e. Paris, National Library, Fonds Lat. 2477, of about 1350; (4) "London-Lumley," i.e. London, British Museum, MSS. Reg. 13 A xiv., of late 13th century. Three other MSS. certainly exist; yet six more are perhaps to be found, but none of these possess the value of those given above. Besides the editions referred to in the body of the article, we may also mention (1) P. Girolamo Golubovich, Bibliotheca bio-bibliografica della Terra Santa e dell' Oriente Francese (1906), vol. i. (1215-1309), pp. 190-213; (2) William of Rubruck, with his John of Pian de Carpi, ed. by W. W. Rockhill, Halkut Society (1900), especially pp. 1-39; (3) C. Raymond Beazley, Dawn of Modern Geography, ii. (1901), 279-317; 375-380; iii. 85, 544, 553; and Carpini and Rubruquis, Halkut Society (1903), especially pp. vii.-viii. 43-144, 249-295.

CARPOCRATES, a Gnostic of the 2nd century, about whose life and opinions comparatively little is known. It is said to have been a native of Alexandria and by birth a Jew. His family, however, seem to have been converted to Christianity. With Epiphanes, his son, he was the leader of a philosophic school basing its theories mainly upon Platonism, and striving to amalgamate Plato's Republic with the Christian ideal of human brotherhood. The image of Jesus was crowned along with those of Pythagoras, Plato and Aristotle. Carpoctates made special use of the doctrines of reminiscence and pre-existence of the soul. He regarded the world as formed by inferior spirits who are out of harmony with the supreme soul (knowledge of which is the true Gnosis). The souls which remember their pre-existing exist can attain to this contemplation of unity, and thereby rise superior to all the ordinary doctrines of religion or life. Jesus is but a man in whom this reminiscence is unusually strong, and who has consequently attained to unusual spiritual excellence and power. To the Gnostic the things of the world are worthless; they are to him matters of indifference. From this position it easily followed that actions, being merely external, were morally indifferent, and that the true Gnostic should abandon himself to every lust with perfect indifference. The express declaration of these antinomian principles is said to have been given by Epiphanes. The notorious licentiousness of the sect was the carrying out of their theory into practice.

CARPOZOV (Latinized Carposovius), the name of a family, many of whose members attained distinction in Saxony in the 17th and 18th centuries as jurists, theologians and statesmen. The family traced its origin to Simon Carpozov, who was burgomaster of Brandenburg in the middle of the 16th century, and who left two sons, Joachim (d. 1628), master-general of the ordnance in the service of the king of Denmark, and Benedikt (1565-1624), an eminent jurist.

Benedikt Carpozov was born in Brandenburg on the 22nd of October 1565, and after studying at Frankfurt and Wittenberg, and visiting other German universities, was made doctor of laws at Wittenberg in 1590. He was admitted to the faculty of law in 1592, appointed professor of institutions in 1599, and promoted to the chair Digesti instructi et novi in 1601. In 1602 he was summoned by Sophia, widow of the elector Christian I. of Saxony, to her court at Colditz, as chancellor, and was at the same time appointed councillor of the court of appeal at Dresden. After the death of the electress in 1623 he returned to Wittenberg, and died there on the 26th of November 1624, leaving five sons. He published a collection of writings entitled Disputationes Juridicae.

Benedikt Carpozov (1595-1660), second of the name, was the second son of the preceding, and like him was a great lawyer. He was born at Wittenberg on the 27th of May 1595, was at first a professor at Leipzig, obtained an honourable post at Dresden in 1639, became ordinary of the faculty of jurists at Leipzig in 1645, and was named privy councillor at Dresden in 1653. Among his works which had a very extensive influence on the administration of justice, even beyond the limits of Saxony, are Definiiones forenses (1658), Praxite nova, Imperialis proces- surer criminalium (1635), Opus decisionum illustratum Saxoniae (1646), Processus juris Saxonic (1657), and others. He did much, both by his writings and by his official work, to systematize the body of German jurisprudence which had resulted from the intersection of the common law of Saxony with the Roman and Canon laws. His last years were spent at Leipzig, and his time was entirely devoted to sacred studies. He read the Bible through fifty-three times, studying also the comments of Osianer and other authors. He made voluminous notes. These have been allowed to remain in manuscript. He died at Leipzig on the 30th of August 1666.

Johann Benedikt Carpozov (1607-1657), fourth son of the first Benedikt, was born at Rochlitz in 1607. He became professor of theology at Leipzig in 1643, made himself chiefly known by his Isagoge in Libros Ecclesiastum Laurentianum Symbolicos (published in 1655), and died at Leipzig on the 22nd of October 1657, leaving five sons, all of whom attained some literary eminence.

August Carpozov (1612-1683), fifth son of the first Benedikt, distinguished himself as a diplomatist. Born at Colditz on the 4th of June 1612, he studied at the universities of Wittenberg, Leipzig and Jena, and in 1637 was appointed advocate of the court of justice (Holgericht) at Wittenberg. Entering the service of Frederick William II., duke of Saxe-Altenburg, he took part in the negotiations which led to the peace of Westphalia in 1648, and was appointed chancellor by the duke in 1649. From 1672 to 1680 he was chief minister of Ernest I. and Frederick I., dukes of Saxe-Coburg-Gotha, and died at Coburg on the 19th of November 1683. August, who was a man of earnest piety, wrote Der gekreuzigte Jesus (1679) and some treatises on jurisprudence.

Johann Gotlob Carpozov (1679-1767), grandson of Johann Benedikt, was born at Dresden in 1679. He was educated at Wittenberg, Leipzig and Altdorf, became a learned theologian, and in 1719 was appointed professor of Oriental languages at Leipzig. In 1730 he was made superintendent and first pastor at Lübeck. His most important works were the Introductio in libros canonicos bibliorum Veteris Testamenti (1711), Critica sacra V.T. (1728), and Apparatus Historico-criticus Antiquissam V. Test. (1748). He died at Lübeck on the 7th of April 1767.

Johann Benedikt Carpozov (1720-1803), great-grandson of the first Johann Benedikt, was born at Leipzig, became professor of philosophy there in 1747, and in the following year removed to Halmstedt as professor of poetry and Greek. In 1749 he was named also professor of theology. He was author of various philological works, wrote a dissertation on Mencius, and published an edition of Musaeus. He died on the 28th of April 1803.

On the family of Carpozov, see Dreyhaupt, Beschreibung des Saatkreises, Beilagen zu Theil 2. S. 26.

CARRANZA, BARTOLOMÉ (1533-1576), Spanish theologian, sometimes called de Miranda or de Carranza y Miranda, younger son of Pedro Carranza, a man of noble family, was born at Miranda d'Arga, Navarre, in 1533. He studied (1515-1520) at Alcalá, where Sancho Carranza, his uncle, was professor; entered (1520) at the of its juridical, a Charles kept him to England (1554) with his son Philip on occasion of the marriage with Mary. He became Mary's confessor, and laboured earnestly for the re-establishment of the old religion, especially in Oxford.
In 1557 Philip appointed him to the archbishopric of Toledo; he accepted with reluctance, and was consecrated at Brussels on the 21st of February 1558. He was at the deathbed of Charles V. (21st of September) and gave him extreme unction; then raised a curious controversy as to whether Charles, in his last moments, had been infected with Lutheranism. The same year he was again denounced to the Inquisition, on the ground of his Comentarios sobre el Catechismo (Antwerp, 1558), which in 1563, however, was approved by a commission of the council of Trent. He had evidently lost favour with Philip, by whose order he was arrested at Tordelaguna (1559) and imprisoned for nearly eight years, and the book was placed on the Index. The process dragged on. Carranza appealed to Rome, was taken thither in December 1566, and confined for ten years in the castle of St Angelo. The final judgment found no proof of heresy, but compelled him to abjure sixteen errors, rather extorted than extracted from his writings, suspended him from his see for five years, and excluded him to the Dominican cloister of Sta Maria sopra Minerva. Seven days after his abjuration he died, on the 2nd of May 1576. He was succeeded in his see by the inquisitor-general, Gaspar Quiroga. 

For the Spanish people honoured him as a saint; Gregory XIII. placed a laudatory inscription on his tomb in the church of Sta Maria. His real crime was not heresy but reform. His Summa Concordiorum et Pontificum (Venice, 1560) has been often reprinted (as late as 1821), and has permanent value.

See P. Salazar de Miranda, Vida (1788); H. Langwitz, Bartholomäus Carranza (1780); J. A. Llorente, Hist. Inquisicion en Spain (English abridgment, 1826); Hefele in J. Gschicher's Dict. encyclopédie de la théol. cath. (1858).

A. Go
t

CARRARA, or CARRARESI, a powerful family of Longobard origin which ruled Padua in the 14th century. They take their name from the village of Carrara near Padua, and the first recorded member of the house is Gamberto (d. before 970). In the wars between Guelphs and Ghibellines the Carraresi at first took the latter side, but they subsequently went over to the Guelphs. This brought them into conflict with Ezzelino da Romano; Jacopo da Carrara was besieged by Ezzelino in his castle of Agna, and while trying to escape was drowned. Another Jacopo led the Paduans in 1312 against Carrara; della Scala, lord of Verona, and though taken prisoner managed to negotiate a peace in 1318. To put an end to the perpetual civil strife the Paduans elected him their lord, and he seems to have governed well, leaving the city at his death (1324) to his nephew Marsiglio, a man famed for his cunning. But Cangrande was bent on acquiring Padua, and Marsiglio, unable to resist, gave it over to him and was appointed its governor. Cangrande died in 1319, being succeeded by his nephew Martino, and Marsiglio soon began to mediate treachery; he negotiated with the Venetians in 1336, and in the following year he secretly introduced Venetian troops into Padua, arrested Alberto della Scala, Martino's brother, then in charge of the town, and thus regained the lordship. He died in 1338, and was succeeded by his relative Ubertino, a typical medieval tyrant, who earned an unenviable notoriety for his murders and acts of treachery, but was also a patron of the arts; he built the Palazzo dei Principi, the castle of Este, constructed numerous bridges and canals, and fostered commerce. He died in 1345. His distant kinsman Marsiglito da Carrara succeeded to him, but was immediately assassinated by Jacopo da Carrara, a prince famed as the friend of Petrarch. In 1350 Jacopo was murdered by Guglielmo da Carrara, and his brother Jacopino succeeded, reigning together with his nephew Francesco.

In 1355 Francesco (il Vecchio) rose against his uncle and imprisoned him. Francesco changed the traditional policy of his house by quarrelling with the Venetians, in the hope of obtaining more advantages from the Visconti of Milan. When the former were at war with Hungary over Dalmatia in 1356 and asked Carrara to help them, he refused. Their resentment was all the more bitter when at the instance of the pope he mediated between them and Hungary and brought about peace on terms unfavourable to the republic. He received Feltrè, Belluno and Cividale from the Hungarian King, but in 1360 a frontier dispute led to war between him and Venice. After some defeats, Venice was victorious and dictated peace; Carrara had to pay a huge indemnity and ask the republic's pardon (1373). In 1378 he joined the league against Venice formed by Genoa, Hungary and the Scala, and took part in the siege of Chioggia. But the Venetians were victorious, and by the peace of Turin Carrara found himself in the status quo ante, but he bought Treviso from Austria, to whom Venice had given it in the day of her trouble. In 1385 the Venetians set the Scala against Carrara, who thereupon allied himself with the treacherous Gian Galeazzo Visconti. The Scala were expelled from Verona, but Carrara and Visconti quarrelled over the division of the spoils. Visconti was determined to capture Padua as well as Verona, and made an alliance with Venice and the house of Este for the purpose. Francesco, seeing that the situation was hopeless, surrendered to Visconti, in whose hands he remained a prisoner until his death in 1392.

Francesco Novello, his son, resisted bravely, but was compelled to surrender owing to dissensions in Padua itself. He was forced to renounce his dominions, and received a castle near Asti, which he escaped to France, and after a series of romantic adventures succeeded to an estate which was becoming alarmed at the restless ambition and treachery of Visconti; in 1390 he raised a small armed force and seized Padua, where he was enthusiastically welcomed by the citizens, and for several years reigned there in peace. But in 1399 Visconti recommenced his wars of conquest, which were to have included Padua had not death cut short his schemes in 1402. Carrara then allied himself with Guglielmo Scala, seized Verona, and tried to capture Vicenza. But the Vicentini had always hated the Carraresi, and after a short siege gave themselves over to Venice. This led to a war between that republic and Padua, for now that Visconti was dead the Venetians had no longer any reason to protect Carrara. Padua and Verona were besieged; the latter, defended by Novello's son Jacopo, was soon captured. Novello himself, besieged in his capital, although repeatedly offered favourable terms, held out for some months hoping for help from Florence and also from certain Venetian nobles with whom there was intrigue and intrigue. Hunger, plague, the treachery of his captains and internal discontent at last forced him to surrender (November 1405). He and his sons Francesco III. and Jacopo were conveyed to Venice, and at first treated with consideration; but when their intrigues with Venetian traitors for the overthrow of the republic came to light, they were tried, condemned, and strangled in prison (1406). Novello's other son Marsiglio made a desperate attempt to recover Padua in 1435, but was discovered and killed. With him the house of Carrara ceased from troubling.

CARRARA, a town of Tuscany, Italy, in the province of Massa e Carrara, 300 ft. above sea-level, 3 m. by rail N.E. of Avenza, which is 176 m. E.S.E. of Spezia. Pop. (1881) 73,325; (1905) town, 38,100; commune, 48,493. The cathedral (1372-1385) is a fine Gothic building dating from the period of Pisan supremacy; the other churches, and indeed all the principal buildings of the town, are constructed of the local marble, to which the place owes its importance. The Accademia di Belle Arti contains several Roman antiquities found in the quarries, and some modern works by local sculptors. A large theatre was inaugurated in 1892. Some of the quarries were worked in Roman times (see LUNA), but were abandoned after the downfall of the western empire, until the growth of Pisan architecture and sculpture in the 12th and 13th centuries created a demand for it. The quarries now extend over almost the whole of the Apuan Alps, and some 600 of them are being worked, of which
CARREL—CARRIAGE

345, with 4400 workmen, are at Cerrara itself, and 56 (700 men) at Massa. The amount exported in 1899 was 18,000 tons. The railways are served by a separate railway, with several branch lines.

CARRELL, JENAPTIS NIGAR ARMAND (1800–1836), French publicist, was born at Rouen on the 8th of May 1800. His father was a merchant in good circumstances, and he received a liberal education at the college of Rouen, afterwards attending the military school at St Cyr. He had an intense admiration for the great generals of Napoleon, and his uncompromising spirit, bold uprightness and independent views marked him as a man to be suspected. Entering the army as a sub-lieutenant he took a secret but active part in the unsuccessful conspiracy of Befort. On the outbreak of war with Spain in 1823, Carrel, whose sympathies were altogether with the liberal cause, sent in his resignation, and succeeded in effecting his escape to Barcelona. He enrolled himself in the foreign legion and fought gallantly against his former comrades. Near Figueres the legion was compelled to surrender, and Carrel became the prisoner of his old general, Dumas. There was considerable difficulty about the terms of capitulation, and one council of war condemned Carrel to death. Fortunately some informality prevented the sentence being executed, and he was soon afterwards acquitted and set at liberty. His career as a soldier being then finally closed, Carrel resolved to devote himself to literature. He came to Paris and began as secretary to Augustin Thierry, the historian. His services were found to be of great value, and he not only obtained admirable training in habits of composition, but was led to investigate for himself some of the most interesting portions of English history. His first work of importance (he had already written one or two historical abstracts) was the History of the Counter-Revolution in England, an exceedingly able political study of the events which culminated in the Revolution of 1688. He gradually became known as a skilful writer in various periodicals; but it was not till he formed his connexion with the National that he became a power in France. The National was at first conducted by Thiers, Mignet and Carrel in conjunction; but after the revolution of July, Thiers and Mignet assumed office, and the whole management fell into the hands of Carrel. Under his direction this journal became the first political organ in Paris. His judgment was unusually clear, his principles solid and well founded, his sincerity and honesty beyond question; and to these qualities he united an admirable style, lucid, precise and well balanced. As the defender of democracy he had frequently to face serious dangers. He was once in Ste Pelage, and several times before the tribunal to answer for his journal. Nor was he in less danger from private enemies. Before his last fatal encounter he was twice engaged in duels with editors of rival papers. The dispute which led to the duel with Emile de Girardin was one of small moment, and might have been amicably arranged had it not been for some slight obstinacy on Carrel’s part. The meeting took place on the morning of the 22nd of July 1836. De Girardin was wounded in the thigh, Carrel in the groin. The wound was at once seen to be dangerous, and Carrel was conveyed to the house of a friend, where he died after two days suffering.

His works, with biographical notice by Litré, were published in five volumes (Paris, 1838). A fine estimate of his character will be found in Mill’s Dissertations, vol. i.

CARRERA, JOSÉ MIGUEL (1785–1821), the principal leader in the early fighting for the independence of Chile, was born at Santiago on the 15th of October 1785. Sent to Spain for a military career, he served in the Spanish army in the Napoleonic war, but returned to Chile in July 1811, where his vigorous character and military experience enabled him by means of a series of coup d’états to place himself at the head of the nationalist government. Though at first he laboured patriotically to establish a stable administration, to promote education, and to organise the Chilean forces, his selfish arrogant spirit produced dissensions between himself and other patriots, and it was his rivalry with Bernardo O’Higgins that led to the defeat of the nationalist forces at Rancagua in 1814. In the expedition of 1817, led by José de San Martín and Bernardo O’Higgins, which resulted in the liberation of Chile, Carrera had no share, owing to his hostility to the leaders, but he attempted to procure in the United States materials for a fresh enterprise of his own. The Argentine government, however, suspicious of his intentions, would not allow him to go to Chile, and Carrera, enraged by this treatment and by the execution of his brothers at Mendoza by the San Martin party, proceeded to organize rebellion in Argentina, but was eventually captured and shot at Mendoza on the 4th of September 1821.

See A. Valdes, Revolución Chilena y Campañas de la Independencia (Santiago, 1888), which is practically a vindication of Carrera’s career; and also D. B. de Saavedra, Diccionario biograficos de Chile: Vol. I (Santiago, 1887), and J. B. Suarez, Rasgos biograficos de hombres notables de Chile (Valparaiso, 1886), both giving biographical sketches of prominent characters in Chilean history.

CARRIAGE, a term which in its widest signification is used, as its derivation permits, for any form of ‘carrying’; thus, a person’s ‘carriage’ is still spoken of in the sense of the way he bears himself. But it is more specifically the general term for all vehicular structures employed for the purposes of transport of merchandise and movable goods and of human beings. Such vehicles are generally mounted on wheels, but the sledge and the litter are types of the exception to this rule. Within this definition a vast variety of forms is included, ranging from the coster’s barrow and rude farm-cart up to the luxuriously appointed sleeping-cars of railways and the state carriages of royal personages. A narrower application, however, limits the term to such vehicles as are used for the conveyance of persons and are drawn by horses, and it is with carriages in this restricted sense that we are here concerned. Tramcars, railway carriages and motor-cars are dealt with in other articles.

History.—A wheeled carriage appears to have been in very general use in Egypt at an early period, called a car or chariot (q.v.); in the Bible the word is usually translated ‘chariot.’ The bodies of these chariots were small, usually containing only two persons standing upright. They were very light, and could be driven at great speed. They were narrow, and therefore suitable to Eastern cities, in which the streets were very narrow, and to mountainous roads, which were often only 4 ft. wide. From Egypt the use of chariots spread into other countries, and they were used in war in large numbers on the great plains of Asia. We read of the 900 chariots of Jabin, king of Canaan; how David took 700 chariots from the kings of Syria and 1000 from the king of Zobah. Solomon had 1400 chariots, and his merchants supplied northern Syria and the surrounding countries with chariots brought out of Egypt at 600 shekels (about £50) apiece. From the ancient sculptures preserved from Nineveh and Babylonia, some of which are in the British Museum, we observe the use of chariots continued for the purpose of hunting as well as for war. Homer describes the chief warriors on both sides at the siege of Troy as going into battle and fighting from their chariots. The Roman nation as it increased in power adopted the car, though chiefly for purposes of show and state. A beautiful marble model of one of these still exists at the Vatican Palace. The chariot was of wood, with a round body, costing it in the museum at South Kensington. The war chariots among the Persians were larger; the idea seems to have been to form a sort of turret upon the car, from which several warriors might shoot or throw their spears. These chariots were provided with curved blades projecting from the axle-trees. Alexander the Great, king of Macedon, invading Asia was met upon the banks of the river Indus by King Porus, in whose army were a number of elephants and also several thousand chariots. On Alexander’s return from India towards Persia, he travelled in a chariot drawn by eight horses, followed by an innumerable number of others covered with rich carpets and purple coverlets. After Alexander’s death a funeral car was prepared to convey his body from Babylon to Alexandria in Egypt, and this car has perhaps never been excelled in the annals of coach-building. It was designed by the celebrated architect Hieronymus, and took two years to build. It was 18 ft. long and 12 ft. wide, on four massive wheels, and drawn by sixty-four mules, eight abreast. The car was composed
of a platform, with a lofty roof, supported by eighteen columns, and was profusely adorned with drapery, gold and jewels; round the edge of the roof was a row of golden bells; in the centre was a throne, and before it the coffin; around were placed the weapons of war and the armour that Alexander had used.

The Romans established the use of carriages as a private means of conveyance, and with them carriages attained great variety of form as well as richness of ornamentation. In all times the employment of carriages depended greatly on the condition of the roads over which they had to be driven, and the establishment of good roads, such as the Appian Way, constructed 331 B.C., and others, greatly facilitated the development of carriage travelling among the Romans. In Rome itself, and probably also in other large towns, it was necessary to restrict travelling in carriages to a few persons of high rank, owing to the narrowness and crowded state of the streets. For the same reason the transport of goods along the streets was forbidden between sunrise and sunset. For long journeys and to convey large parties the reba and carruca appear to have been mostly used, but what their construction and arrangements were is not known. During the empire the carriage which appears in representations of public ceremonial is the carpentum. It is very slight, with two wheels, sometimes covered, and generally drawn by two horses. If a carriage had four horses they were yoked abreast, among the Greeks and Romans, not in two pairs as now. From the carruca are traced the modern European names,—the English carriage, the French carrosse and the Italian carrozza. The sirpea was a very ancient form of vehicle, the body of which was of osier basket-work. It originated with the Gauls, by whom it was named lonna, and by them it was employed for the conveyance of persons and goods in time of peace, and baggage during war. With its name are connected the modern French banne, banneton, wonnerie and faneur,—all indicating basket-work.

The ancient Britons used a car for warlike purposes which was evidently new to the Romans. It was open in front, instead of at the back as in their cars; and the pole, which went straight out between the horses, was broad, so that the driver could walk along, and if needful drive from the front. Above all, it possessed a seat, and was called essedum from this peculiarity. For war purposes this car was provided with scythes projecting from the ends of the axle-trees. Cicero, writing to a friend in Britain, remarks "that there appeared to be very little worth bringing away from Britain except the chariots, of which he wished his friend to bring him one as a pattern."

Carriages of the Roman emperors were sometimes very splendidly ornamented with gold and precious stones; and covered carriages seem more and more to have become appendages of Roman pomp and magnificence. Sumptuary laws were enacted on account of the public extravagance, but they were little regarded, and were altogether abrogated by the emperor Alexander Severus. Suetonius states that Nero took with him on his travels no less than a thousand carriages.

On the introduction of the feudal system the use of carriages was for some time prohibited, as tending to render the vassals less fit for military service. Men of all grades and professions rode on horseback, the lords rode on pack-horses, and men on she-asses. Horseback was the general mode of travelling; and hence the members of the council, who at the diet and on other occasions were employed as ambassadors, were called Rittmeister. In this manner also great lords made their public entry into cities.

Covered carriages (see Coach) were known in the beginning of the 13th century, but their use was confined to ladies of the first rank; and as it was accounted a reproach for men to ride in them, the electors and princes sometimes excused their non-attendance at meetings of the state by the plea that their health would not permit them to ride on horseback. Covered carriages were for a long time forbidden even to women; but about the end of the 15th century they began to be employed by the emperor, kings and princes in journeys, and afterwards on state occasions. In 1474 the emperor Frederick III. visited Frankfort in a close carriage, and again in the following year in a very magnificent covered carriage. Shortly afterwards carriages began to be splendidly decorated; that, for instance, of the electress of Brandenburg at the tournament held at Ruppin in 1509 was gilded all over, and that of the duchess of Mecklenburg was hung with red satin. When Cardinal Dietrichstein made his entrance into Vienna in 1611, forty carriages went to meet him; and in the same year the consort of the emperor Matthias made her public entrance on her marriage in a carriage covered with perfumed leather. The wedding carriage of the first wife of the emperor Leopold, who was a Spanish princess, cost, together with the harness, 38,000 florins. Those of the emperor are thus described: "In the imperial coaches no great magnificence was to be seen; they were covered over with red cloth and black nails. The harness was black, and in the whole work there was no gold. The panels were of glass, and on this account they were called the imperial glass coaches. On festivals the harness was ornamented with red silk fringes. The imperial coaches were distinguished only by their having leather traces; but the ladies in the imperial suite were obliged to content with carriages the traces of which were made of ropes." At the magnificent court of Emperor Charles VI at Hanover, in 1681, there were fifty gilt coaches with six horses each. The first time that ambassadors appeared in coaches on a public solemnity was at the imperial commission held at Erfurt in 1613. Soon after this time coaches became common all over Germany, notwithstanding various orders and admonitions to deter vassals from using them. These vehicles appear to have been of very rude construction. Beckmann describes a view he had seen of Bremen, painted by John Landwehr in 1661, in which was represented a long quadrangular carriage, apparently not suspended by straps, and covered with a canopy supported by four pillars, but without curtains. In the side was a small door, and in front a low seat or box; the coachman sat upon the horses; and the dress of the persons within proved them to be burgomasters. At Paris in the 14th, 15th and even 16th centuries, the French monarchs rode commonly on horses, the servants of the court on mules, and the princesses and principal ladies sometimes on ass. Persons even of the highest rank sometimes sat behind their equestrian on the same horse. Carriages, however, were used at a very early period in France; for there is still extant an ordinance of Philip the Fair, issued in 1294, by which citizens' wives are prohibited from using them. It appears, however, that about 1550 there were only three carriages at Paris,—one belonging to the queen, another to Diana of Poitiers, and the third to René de Laval, a very corpulent nobleman who was unable to ride on horseback. The coaches used in the time of Henry IV. were not suspended by straps (an improvement referred to the time of Louis XIV.), though they were provided with a canopy supported by four ornamental pillars, and with curtains of stuff or leather.

Occasional allusion is made to the use of some kinds of vehicles in England during the middle ages. In The Squire of Low Degree, a poem of a period anterior to Chaucer, a description of a sumptuous carriage occurs: "To-morrow we shall on hunting fare
And ride, my daughter, in a chariot
It shall be cover'd with velvet red,
And cloth of fine gold all about your head,
With damask white and azure blue
Well diaper'd with lilts new."

Chaucer himself describes a chariot as

"With gold wrought and pierrie."

When Richard II. of England, towards the end of the 14th century, was obliged to fly before his rebellious subjects, he and all his followers were on horseback, while his mother alone used a carriage. The oldest carriages used in England were known as chariots, chariots, carchetes and whirlicotes; but these became less fashionable when Ann, the wife of Richard II., showed the English ladies how gracefully she could ride on the side-saddle, Stow, in his Survey of London, remarking, "so was riding in those whirlicotes and chariots forsaken except at coronations and such like spectacles."
There were curious sumptuary laws enacted during the 16th century in various Italian cities against the excessive use of silk, velvet, embroidery and giltwork on the coverings of horses and the trappings of horses. In 1564 Pope Pius IV. exhorted the cardinals and bishops not to ride in coaches, according to the fashion of the times, but to leave such things to women, and themselves ride on horseback. The use of coaches in Germany in the 16th century was not less common than in Italy. The current of trade, especially from the East, had for a long time poured into those two countries towards Holland, enriching all the cities in its progress. Macpherson, in his *History of Commerce*, says that Antwerp possessed 500 coaches in 1560. France and England appear to have been behind the rest of Europe at this period.

The first coach in England was made in 1555 for the earl of Rutland by Walter Rippon, who also made a coach in 1556 for Queen Mary, and in 1564 a state coach for Queen Elizabeth. That one of the carriages used by Queen Elizabeth could be opened and closed at pleasure may be inferred from her causing at Warwick during one of her progresses—"every part and side of her coach being opened that all her subjects present might behold her, which most gladly they desired."

Coaches of the type now properly so-called were first known in England about the year 1580, and were introduced, according to Stow, from Germany by Henry Fitzalan, 12th earl of Arundel. By the beginning of the 17th century the use of coaches had become so prevalent in England that in 1601 the attention of parliament was drawn to the subject, and a bill "to restrain the excessive use of coaches" was introduced, which, however, was rejected on the second reading. Their use told severely on the occupation of the Thames watermen, and Taylor the poet and waterman complained bitterly both in prose and verse against the new-fangled practice:

"Carroaches, coaches, jades, and Flanders mares
Doe rob us of our shares, our wares, our fares.
Against the ground we stand and knock our heels
Whilst all our profit runs away on wheelers."

The snare of wits and watermen notwithstanding, coaches became so common, that in the early part of the 17th century they were estimated to number more than 6000 in London and its surrounding country.

We now arrive gradually at the modern conception of carriage-building. No trace of glass windows or complete doors for coaches seems to have existed up to 1650. But plain and rude as was the first coach of Louis XIV., it was in his reign, which lasted till 1715, that the most rapid progress was made. The credit for this is equally due to Germany, Italy, France and England. There is very little mention made by historians of steel springs, but they were first applied to wheel carriages about 1670, prior to which bodies were suspended by long straps from the four corners to pillars erected upon the under carriage. The great advantage of the introduction of springs was speedily recognized as reducing vibration, enabling carriages to be built much lighter and lessening the draught for the horses. In the diary of Samuel Pepys there are many amusing and interesting references to the art of coach-building, which was beginning to attract much attention at that period.

In the French *Encyclopédie* (1772) by Diderot there are elaborate descriptions of the art of coach-building, the workshops and tools used, and plates of the different carriages in use. The 18th century is remarkable for the rapid development which took place, more especially in the manufacture of state carriages of a sumptuous and ornate character, which were largely in demand by the various courts of Europe. One of the most beautiful of these is that belonging to the imperial family of Vienna, which was built in 1696, and is shaped with all the curves that are familiar to us in cabinets and furniture of the style of Louis XIV. The panels are beautifully painted with nymphs in the style of Rubens. There is an unusual quantity of plate glass in the panels, and on the centre of the roof is a large imperial crown. In 1757 was built the elaborate state coach of the city of London, and in 1762 the royal state coach of England, built for King George III. (see Coach). During the reigns of George II. and George III. all English manufactures had received an immense impulse from the energy of the men of the time, in which they were much encouraged by the action of the Society of Arts in offering money prizes for improvements; and in these coach-builders largely participated.

In the year 1804 Obadiah Elliot patented his plan for hanging vehicles upon elliptical springs, thus dispensing with the heavy wood and iron box and cross bars, invariably used in four-wheeled carriages up to that time. Elliot was rewarded by the grant of a gold medal by the Society of Arts, and extensive orders for the carriages of a lighter character, which he was thus enabled to produce.

Of carriages much in fashion and characteristic of this period may be mentioned the "curricle," a cabriolet (see below) on two wheels, driven with a pair of horses, the balance being secured by an ornamental bar across the horses' backs, connected by a leather brace to a spring under the pole. For lack of perfect safety this was gradually superseded by the "gentleman's cabriolet," for one horse, on C springs, fitted with folding leather hood and platform behind, on which stood a youthful trim servant in top-boots, popularly termed a "tiger." To produce this satisfactorily, the best coach-building talent was required, and to work it a horse of exceptional strength and breeding was needful, but when complete this equipage had a distinction never surpassed. During this period the pair-horse "mailphaeton" was introduced, and has enjoyed a long period of popularity. As a travelling carriage with the needful appointments the "britzka," having a straight body with ogee curves at front and back, with single folding hood, and hung on C springs, was a distinctive and popular feature among carriages of the period from 1824 until after 1840. Of two-wheeled vehicles the "stanhope" and "tilbury" gigs, the "dog cart" and "tandem cart," came into use during these years, and have afforded facilities of agreeable locomotion to many thousands of people at a moderate cost. But the greatest improvement of this period was the introduction of the "brougham." Several attempts had been made to arrive at a light carriage of this description, but it was not until 1839 that a carriage was produced to a design adopted by Lord Brougham, and called after him. The "victoria" was known as a carriage for public hire in continental cities for several years before being adopted as a fashionable carriage by the wealthy classes. In 1869 the prince of Wales bought one from Paris of the cab shape, and Baron Rothschild bought one from Vienna of the square shape, examples speedily followed. In various elegant and artistic forms, either as an elliptic or C spring, it has since become a most popular and convenient carriage.

Public carriages for hire, or hackney (q.v.) coaches, were first established in London in 1625. In 1635 the number was restricted to fifty. Still they increased, notwithstanding the opposition of the court and king, who thought they would break up the roads, till in 1650 there were as many as 500. In Paris public carriages were introduced during the minority of Louis XIV., by Nicholas Sauvage, who lived in the rue St Martin at the sign of St Fiacre, from which circumstance hackney carriages in Paris have since been called *faîtres*. In 1694 the number in London had increased to 700. Many of these were old private coaches of the nobility and gentry, and it was not until 1750 that coaches on a smaller scale were built specially for hackney purposes (see Coach).

We are told that in 1673 there were stage coaches from London to York, to Chester and to Exeter, having each forty horses on the road, and carrying each six inside-passengers. The coach occupied eight days travelling to Exeter. In 1705 a coach went from London to York every Monday, Wednesday and Friday, performing the journey in four days. In the same year there was a coach from London to Birmingham starting on Monday and arriving on Wednesday. In 1754 a coach was started from Manchester called the Flying coach, which was advertised to reach London in four days and a half. In 1754 coaches became universal at the speed of 8 m. an hour.
CARRIAGE

In the year 1786 the prince of Wales, afterwards George IV., began to erect the pavilion at Brighton, and this led to a great increase of traffic, so that in 1820 no less than 70 coaches daily visited and left Brighton. The number continued to increase, until in 1835 there were as many as 700 mail coaches throughout Great Britain and Ireland. The system of road construction introduced by Mr McAdam during this time was of great value in facilitating this development.

Notwithstanding the competition of the sedan-chair (q.v.), the hackney-coach held its place and grew in importance, till it was supplanted about 1820 by the cabriolet de place, now shortened into " cab " (q.v.), which had previously held a most important place in Paris. In that city the cabriolet came into great public favour about the middle of the 18th century, and in the year 1813 there were 1150 such vehicles plying in the Parisian streets. The original cabriolet was a kind of hooded gig, inside which the driver sat, besides whom there was only room left for a single passenger. For hackney purposes Mr Boulois introduced a four-wheeled cab to carry two persons, which was followed by one to carry four persons, introduced by Mr Harvey, the prototype of the London " four-wheeler."

The cabriolet gig (1834) owes its invention to J. A. Hansom (q.v.), the architect of the Birmingham town-hall. This has passed through many stages of improvement with which the name of Forder of Wolverhampton is conspicuously associated.

The prototype of the modern " omnibus " first began plying in the streets of Paris on the 18th of March 1862, going at fixed hours, at a stated fare of five sous. Soldiers, lackeys, pages and livery servants were forbidden to enter such conveyances, which were announced to be pour la plus grande commodité et liberté des personnes de mérite. In the time of Charles X., the omnibus system in reality was established; for no exclusion of any class or condition of person who tendered the proper fare was permitted in the vehicles then put on various routes, and the fact of the carriages being thus " at the service of all " gave rise to the present name. The first London omnibus was started in July 1829 by the enterprising Mr Shillibeer. The first omnibuses were drawn by three horses abreast and carried twenty-two passengers all inside. Though appearing unwieldy they were light of draught and travelled speedily. They were, however, too large for the convenience of street traffic, and were superseded by others carrying twelve passengers inside.

In 1849 an outside seat at the centre of the roof was added. The London General Omnibus Company was founded in 1856; since then continual improvements in this system of public conveyance have been introduced.

Modern Private Carriages.—At the accession of Queen Victoria the means of travelling by road and horse-power, in the case of public coaches, had reached in England its utmost limits of speed and convenience, and the travelling-carriages of the nobility and the wealthy were equipped with the completest and most elaborate contrivances to secure personal comfort and safety. More particularly was this the case as regards continental tours, which had become indispensable to all who had at their command the means for this costly educational and pleasurable experience. Concurrently with this development the style and character of coaches and equipages had also reached a consummate degree of splendour and artistic excellence. Not only was this the case in points of decoration, in which livery colour and heraldic devices were effectively employed, but also in the beauty of outline and skilful structural adaptation, in which respect carriages of that period made greater demands upon the capacity of the builder and the skill of the workman than do those of the present day. For this attainment the art of coachmaking was indebted to a very few leading men, whose genius has left its impress upon the art, and is still jealously cherished by those who in early life had experience of their achievements. The early portion of Queen Victoria's reign was an age of much emulation; the best-equipped carriages of that period, distinctive of noble families and foreign embassies, with their graceful outline and superb appointments, and harnessed to a splendid breed of horses—all harmoniously blended, perfect in symmetry and adaptation—gave to the London season, more especially on drawing-room days, and at other times in Hyde Park, an attractiveness unequalled in any other capital. After the death of the prince consort, the pageantry of that period very much declined, and, except as an appendage of royalty, full-dress carriages have since been comparatively few, though there are hopes of a revival in this direction. Meanwhile, owing to the rapid development of railways and the wide extension of commerce, the demand for carriages greatly increased. The larger types gave place to others of a lighter build and more general utility, in which in some cases an infusion of American ideas made its appearance. In accordance with the universal rule of supply meeting the demand, Mr Stenson, an ironmaster of Northampton, was successful in producing a mild forging steel, which proved for some years, until the manufacture ceased, very conducive to the object of securing lightness with strength.

In the early 'seventies the eminent mechanician, Sir Joseph Whitworth, in the course of his scientific studies in the perfecting of artillery, succeeded in manufacturing a steel of great purity, perfectly homogeneous and possessing marvellous tenacity and strength, known as " fluid compressed steel." Incidentally carriage-building was able to participate in the results of this discovery. Two firms well known to Sir Joseph were asked to test its merits as a material applicable to this industry. In this task much difficulty was experienced, the nature of the steel not being favourable to welding, of which so much is required in the making of coach ironwork; but after much perseverance by skilful hands this was at length accomplished, and for some years there existed not a little rivalry in the use of this material, more especially in the case of carriages on the C and under-spring principle, which for lightness, elegance and luxurious riding left nothing to be desired. Many of these carriages may be referred to to-day as rare examples of constructive skill. Unfortunately, the original cost of the material, still more of the labour to be expended upon it, and the difficulty of educating men into the art of working it, were effectual barriers to its general adoption.

The idea, however, had taken hold, and attention was given by other firms to the manufacture of the steel now in general use, admitting of easier application, with approximate, if not equal, results.

From C and under-spring carriages there arose another application of springs which was very prominently before the public during this period, by means of which it was professed that two drawbacks recognized in the C and under-spring carriages were obviated, which were caused by the perch or bar which passes under the body holding the front and hind parts in rigid connexion, and yet making use of a form of spring to which the same terms may be applied. These objections are the weight of the perch, and the limitation which it causes to the facility of turning, which in narrow roads and crowded thoroughfares is an inconvenience. The objection to weight is, however, minimized by the introduction of steel, and as the more advanced builders almost always construct the perch with a...
by leather braces over the C spring proper, by which alone the advantage of superior ease is to be obtained.

Another improvement which stamps the period under review is the introduction of indiarubber for the tires of wheels. To produce a carriage as nearly as possible free from noise and rattle has always been the aim of high-class coachmaking. A structure composed of wood, iron and glass, with axle-trees, doors, windows, lamps and other parts, in use upon the road in all weathers, must from time to time require some attention with this object. To meet this difficulty, the introduction of indiarubber has been received by carriage-users as a great boon.

It was about the year 1852 that Mr Reading, who at that time was known as a builder of invalid carriages, conceived the idea of encircling wheels with that material, but his method only admitted of its use on vehicles travelling slowly over good roads. This was improved upon at a later date by Uriah Scott, who, taking advantage of the tempering capacity of indiarubber by the chemical action of sulphur, produced an inner rim of such density as to hold bolts, by which it could be secured through the felloe, forming a base for the outer covering of soft pliable rubber. This system was attended with satisfactory results, and was in favour for some years with persons whose health needed such provision. Another method, originated by Mr Mulliner of Liverpool in the early 'seventies, was to screw on iron flanges to the outer and inner sides of the felloes, having a kind of lip to press into the indiarubber filling the intervening space; but the cost of this—£3.6 per set—rendered its adoption prohibitive. Meanwhile another invention by Uriah Scott, afterwards improved upon by an American patentee, came into use; this was known as the “rubber-cushioned axle,” cylindrical rings being introduced between the axle-box and hub of the wheel, thus insulating the body of the carriage from the concussion of the road. This, however, necessitated the cutting away of so much of the timber of the hub as to impair its durability, and had, therefore, after a few years’ experience, to be abandoned in favour of an invention by a Parisian builder, who introduced indiarubber bearings between the spring and axle-tree. This was thoroughly practicable, and met with general acceptance, and it is still used in conjunction with iron and steel tires. In 1890 the pneumatic tire was first applied to road carriages. Its bulky appearance is a great drawback, contrasting strongly with the qualities which distinguish a graceful equipage, and in spite of its practical advantages it never became popular in England or America. In Paris and its neighbourhood and many parts of France, pneumatic tires are to be seen in frequent use both on public and private conveyances. In another form the indiarubber tire has become of almost universal application. Owing to an ingenious invention of Mr Carment, what appeared to be an in-superable difficulty in rolling a grooved tire was overcome (fig. 3). This so simplified the application as to bring the cost within practicable limits. The grooved tire is now made in several sections, in some of which the inward projection for securing the rubber is dispensed with, this being kept in position by wires running through the whole length, and electrically welded at the point of contact. Whatever be the method chosen for securing the tire, the best tires, both for durability and ease, are those in which the rubber provided is most resilient in its nature.

For the lifting and lowering of the hoods of victorias and other such carriages, and the opening and closing of landaus, there are now many automatic contrivances, of which the simplest are the most to be preferred. The quarter-light or five-glass landau is a carriage which has been greatly improved. The complicated adjustments of pillars, windows and roof have been replaced by one simple parallel movement. The first public exhibition of a finished carriage on this principle was by an English firm at the Paris Exhibition of 1876 (fig. 4).

In the matter of style certain types of carriages have passed through marked changes. Extreme lightness was at one time considered by many the one desideratum both as to appearance and actual weight, in providing which ease of movement and comfortable seating of the occupants became secondary considerations—though to these extremes builders of repute were always opposed. Still, when at the International Exhibition of Paris 1889, it was seen that the Parisian builders had suddenly gone in the opposite direction, the world of fashion in carriages was taken by surprise. From being built upon easy, flowing, graceful lines, it was seen, with some revulsion of feeling, that these were to be displaced by the deep, full-bodied victoria, brougham and landau. Only by slow degrees did this characteristic find acceptance with English connoisseurs, and then only in a modified form, though eventually in a greater or less degree it is now the prevailing style.

While the better types of English carriages are still predominant in their constructive qualities, and represent the well-known characteristics of individual firms, some emulation may be excited by the elegant taste and careful workmanship which French builders display in points of finish, both internally and externally. Of the various types of carriages now in vogue, the victoria, in its many varieties of form, is the most popular, accompanied, as of necessity, by the double victoria, sociable, brougham, landau and landau. Four-in-hand coaches for private use, as well as the “road” coaches, are built on a smaller scale than formerly; 6 ft. 8 in. may now be taken as the standard height of the roof from the ground. Owing to the encouragement given by the Four-in-hand and Coaching Clubs, the ascendency of this style of driving is still preserved to Great Britain; and in association with it the char-à-banc, mail phaeton, wagonette, and four-wheel dog-cart retain their popularity. Of two-wheeled vehicles the polo-cart and ralli-cart are most in favour, to which may be added the governess-car, which is found convenient for many purposes not implied by its name. For a few years an effort was made, but with very indifferent success, to bring into fashion the tandem-cart, which may again be considered almost obsolete in England.

America has long held a prominent position in connexion with the carriage industry. In all the chief cities manufactories on a colossal scale are to be found, producing thousands of vehicles annually and equipped with the most perfect labour-saving machinery; and as vehicles of any particular pattern—many of small value—are required, not singly, but in large numbers, much economy is exercised in their manufacture. It is remarkable that, as a contrast to the popular buggy, wagon and rockaway of the United States, which are to be found in infinite varieties, carriage establishments of the wealthy are not considered complete unless furnished with some of a European character, selected from the

**Fig. 3.**
most eminent firms of London or Paris, in addition to others of their own manufacture. In Paris preference is given to an excess of bulk, with elaborate scroll ornamentation and denticle window forming indeed instead of gracefulness, an exaggeration, a distinctive class. In respect of workmanship and finish, carriages by the best-known American builders leave nothing to be desired.

The International Exhibition of Paris 1890 brought together examples from various continental countries, in some of which a preference for curvilinear outline was displayed, but the best examples followed very closely the well-known English styles. In the French section it was interesting to find a revival of the once all-prevailing chariot, barouche and brougham, suspended on C and under-springs, with perch, but with ideas of lightness somewhat out of proportion to their general character.

Coach-making, or the carriage-manufacturing industry, is a combination of crafts rarely united in one trade, embracing as it does work in such divers materials as wood, iron, steel, brass, cloth, silk, leather, oils and colours, glass, ivory, hair, indiarubber, &c. Many divisions of labour and numerous highly-skilled artisans are consequently employed in the various stages in the construction of a high-class carriage. The workmen include body-makers, who build up the parts in which persons sit; carriage-makers, who make and fit together all the parts of the vehicle on which the body rests; joiners, who fit the various materials and join them together for special work connected with the strengthening of the body framework by means of long edge plates, the construction of under-works, tiring and wheels, manufacture of springs, axle-tries, &c. Painting is an important part of the business, those professing it being divided into body, carriage and heraldry painters. Trimmers are needed who fit up the upholstery of the interior, and budget trimmers who sew on the patent leather covering to dasher wings.

A very great deal in the coach-making industry depends upon the selection of materials. Ash is the kind of wood required in the framework both of body and carriage. The quality best suited for the body is that of full-grown timber, free from fracture; for the framework that which is structurally strong; that for carriage-poles should be of younger growth, straight and tough in quality. An important consideration is the seasoning of this timber. Planks of various thicknesses are required, varying from 1½ in. to 6 in. for the body, and for seasons being one year for every inch of thickness. After the framework is made, the body is panelled with ½ in. mild Honduras mahogany, plain and free from grain, every joint and groove carefully coated with ground white lead to exclude water. The body is covered with the leather secured by an American invention, by which, in order to obtain the needful width frequently of 5 ft. or upwards, boards are cut from the circumference of the tree, instead of through its diameter; three thicknesses of leather are used, the top and bottom being of the same material, and the middle one being of the centre running across the outer plies, the whole forming a solid covering without joints. Birch and elm of 1 in. thickness also enter into the construction in many carriages; for floor and lining boards pine or fir, for partitions, and perpendiculars.

Wheel-making is a very important branch of the business, in which, owing to the increased lightness now required, many modern improvements have been introduced. The timber used in an ordinary carriage wheel is yew or white-oak, being required for the seasoning being one year for each inch of thickness. The iron used for the spokes is specially cast for the purpose, and being of a small diameter gives the wheel a light appearance. For light springs the finest quality of steel is made from Swedish ore, but the ordinary English spring steel by the best makers leaves nothing to be desired. To secure the necessary resilience it is important that the tapering down of the ends of each plate should be done by hand labour on the anvil, and that the plates should not be more than 1 in. in thickness. To obtain cheapness wholesale springs are made by the method of cylinder rolling, in which two or more plates of circular section are passed between eccentric rollers, and so produced the tapered form, which, however, is too short and gives a lumpy and unsightly appearance to the spring when put together, so that by this they lose much of their pliability. The iron mounting of coast work requires the skill of experienced smiths, and gives scope for much taste and judgment in the work, and providing strength suited to the relative strain to which it will be subjected. Wheel-trees are not usually made by body firms who make the special business. They are of two kinds, the "nail," which are secured to the wheel by three bolts passing through the nave, and the "colling" (invented in 1792), the latter made secure by gun-metal cone-shaped collets and nuts. The axle boxes which are wedged into the nave are of three kinds, cast, chilled and wrought iron, in all cases case-hardened, the first by far the cheapest and the last the most costly. Many attempts have been made to improve upon the colling axle-tree, but none of them has got far beyond the experimental stage.

No branch of coach-building contributes more to the elegance of the vehicle than that of painting. To obtain the needful perfection the work has to be done in the same workshop, the coaling, the finishing colour, which must be of the finest quality. The varnish used is copal, of which there are two kinds, the one for finishing the body, the other the carriage. In first-class work as many as eighteen coats will be required to complete the various stages. After a carriage has been in use about twelve months, it is practicable to revive the brilliant gloss on the panels by hand-polishing with the aid of rottene and oil, a process which requires a specially trained man to do satisfactorily.

The trimming of the interior of a carriage requires much skill and judgment on the part of the workmen in providing really comfortable, well-fitted seats and neatness of workmanship. In the middle of the 18th century figured tabaret or satin were much used, but for many years past morocco has been almost universally preferred. Silk festering spring curtains, Brussels or velvet pile carpet, complete the interior, unless added neat morocco covered trays with metallic perforated backing are used. Special attention is given to the finish, the satin cloth, and the nails used for the interior, and can be applied with much neatness and efficiency. Road lamps, door handles, polished silver or brass furniture, are supplied to the coach-builder by firms whose special business it is to make only articles that are now a very ordinary requirement. Much judgment is needful in the selection of the materials, and careful workmanship to prevent rattle. Indiarubber is the best material for blocks applied to steel tires, and cast iron for indiarubber tires. The "Bowden wire" recently introduced is in some cases a considerable light alternative to the strong bar connecting the handle with the hind cross-levers, and has the advantage of passing out of sight through the interior of the body.

CARRICKFERGUS, a seaport and watering-place of Co. Antrim, Ireland, in the east parliamentary division; on the northern shore of Belfast Lough, 93 m. N.E. of Belfast by the Northern Counties (Midland) railway. Pop. of urban district (1901) 4208. It stretches for about 1 m. along the shore of the Lough. The principal building is the castle, originally built by John de Courcy towards the close of the 12th century, and subsequently much enlarged. It stands on a projecting rock above the sea, and was formerly a place of much strength. It is still maintained as an arsenal, and mounted with heavy guns. The ancient donjon or tower, nearly 100 ft. high, is still standing, with six floorsbelow, built by Sir Henry Sidney, are still visible on the west and north, and the North Gate remains. The parish church of St Nicholas, an antiquated cruciform structure with curious Elizabethan work in the north transept, and monuments of the Chichester family, was originally a chapel or oratory dependent on a Franciscan monastery. The entrance to a subterranean passage between the two establishments is still visible under the communion-table of the church. The gaol, built on the site of the monastery above mentioned, was formerly the county of Antrim prison. The court-house, which adjoins the gaol, is a modern building. The town has some trade in domestic produce, and in leather and linen manufactures, there being several flax spinning-mills and bleach-works in the immediate neighbourhood. Distilling is carried on. The harbour admits vessels of 500 tons. The fisheries are valuable, especially the oyster fisheries. At Duncreey about 2 m. from the town, rock salt of remarkable purity and in large quantity is found in the Triassic sandstone. The neighbouring country is generally hilly, and Slieve Truere (1100 ft.) commands a magnificent prospect. Sir William J. H. had granted all the parts of Ulster he could obtain possession of by the sword, fixed a colony in this district. The castle came in the 13th century into possession of the De Lacy family, who, being ejected, invited Edward Bruce to besiege it (1315). After a desperate resistance the garrison surrendered. In 1386, the town was burned by the Scots, and in 1400 was destroyed by the combined Scots and Irish. Subsequently, it suffered much by famine and the occasional assaults of the neighbouring Irish chieftains, whose favour the townsmen were at length forced to secure by the payment of an annual tribute. In the reign of Charles I. many Scottish Covenanters settled in the neighbourhood.
to avoid the persecution directed against them. In the civil wars, from 1641, Carrickfergus was one of the chief places of refuge for the Protestants of the county of Antrim and on the 10th of June 1642, the first Presbytery held in Ireland met here. In that year the garrison was commanded by General Robert Muir, who, having afterwards relinquished the cause of the English parliament, was surprised and taken prisoner by Sir Robert Adair in 1648. At a later period Carrickfergus was held by the partisans of James II., but surrendered in 1689 to the forces under King William's general Schomberg; and in 1690 it was visited by King William, who landed here on his expedition to Ireland. In 1760 it was surprised by a French squadron under Commodore Thourot, who landed with about 1000 men, and, after holding the place for a few days, evacuated it on the approach of the English troops. Eighteen years later Paul Jones, in his ship the "Ranger," succeeded in capturing the "Drake," a British sloop-of-war, in the neighbouring bay; but he left without molesting the town. In the reign of Queen Elizabeth the town obtained a charter, and this was confirmed by James I., who added the privilege of sending two burgesses to the Irish parliament. The corporation, however, was superseded, under the provisions of the Municipal Reform Act of 1840, by a board of municipal commissioners. Carrickfergus was a parliamentary borough until 1885; and a county of a town till 1858, having previously (till 1750) been a county town of the county Antrim. But its importance was spoiled by the vicinity of Belfast, and its historical associations are now its chief interest.

CARRICKMACROSS, a market town of Co. Monaghan, Ireland, in the south parliamentary division, 68 m. N.W. of Dublin on a branch of the Great Northern railway. Pop. of urban district (1901) 1874. It has a pleasant, elevated site, a considerable agricultural trade, and a famous manufacture of lace, which is carried on in various conventual establishments. There are some remains of an Elizabethan castle, a seat of the earls of Essex, which was destroyed during the wars of 1641; the ruins of the old church of St Finbar commemorate the same disastrous period.

CARRICK-ON-SHANNON, the county town of Co. Leitrim, Ireland, in the south parliamentary division, beautifully situated on the left bank of the upper Shannon, between Loughs Allen and Baderg, close to the confluence of the Boyle. Pop. (1901) 1178. It is on the Sligo branch of the Midland Great Western railway, 90 m. W.N.W. of Dublin, the station being across the river in county Roscommon. Though having so small a population it is the largest town in the county, is the seat of the assizes, and has quays and some river trade. The surrounding country, with its waterways, loughs, and woods, is of considerable beauty.

CARRICK-ON-SUIR, a market town of Co. Tipperary, Ireland, in the east parliamentary division, on the north (left) bank of the Suir, 143 m. W.N.W. from Waterford by the Waterford & Limerick line of the Great Southern & Western railway. Pop. of urban district (1901) 4506. It was formerly a walled town, and contains some ancient buildings, such as the castle, erected in 1306, formerly a seat of the dukes of Ormonde, now belonging to the Butler family, a branch of which takes the title of earl from the town. On the other side of the river, connected by a bridge of the 14th century, and another of modern erection, stands the suburb of Carrickbeg, in county Waterford, where an abbey was founded in 1336. The woollen manufactures for which the town was formerly famous are extinct. A thriving export trade is carried on in agricultural produce, condensed milk is manufactured, and slate is extensively quarried in the neighbourhood, while some coal is exported from the neighbouring fields. Dredging has improved the navigable channel of the river, which is tidal to this point and is lined with quays.

CARRIER, JEAN BAPTISTE (1756–1794). French Revolutionary and Terrorist, was born at Yole, a village near Aurillac in Upper Auvergne. In 1790 he was a country attorney (counsellor for the bailliage of Aurillac) and in 1792 he was chosen deputy to the National Convention. He was already known as one of the influential members of the Cordeliers club and of that of the Jacobins. After the subjugation of Flanders he was one of the commissioners nominated in the close of 1792 by the Convention, and sent into that country. In the following year he took part in establishing the Revolutionary Tribunal. He voted for the death of Louis XVI., was one of the first to call for the arrest of the duke of Orleans, and took a prominent part in the overthrow of the Girondists (on the 1st of May). After a mission into Normandy, Carrier was sent, early in October 1793, to Nantes, under orders from the Convention to suppress the revolt which was raging there, by the most severe measures. Nothing loth, he established a revolutionary tribunal, and formed a body of desperate men, called the Legion of Marat, for the purpose of destroying in the swiftest way the masses of prisoners heaped in the jails. The form of trial was soon discontinued, and the victims were sent to the guillotine or shot or cut down in the prisons en masse. He also had large numbers of prisoners put on board vessels with trap doors for bottoms, and sunk in the Loire. This atrocious process, known as the "Noyades" of Nantes, gained for Carrier a reputation for wanton cruelty. Since in his mission to Normandy he had been very moderate, it is possible that, as he was nervous and ill when sent to Nantes, his mind had become unbalanced by the atrocities committed by the Vendean and royalist armies. Naturally, the stories told of him are not all true. He was recalled by the Convention from Normandy on the 20th of May 1794, took part in the attack on Robespierre on the 9th Thermidor, but was himself brought before the Revolutionary Tribunal on the 11th and guillotined on the 16th of November 1794.

CARRIER, a general term for any person who conveys the goods of another for hire, more specifically applied to the tradesmen, now largely superseded by the railway system, who convey goods in carts or wagons on the public roads. In jurisprudence, however, the term is collectively applied to all conveyors of property, whether by land or water; and in this sense the changes and enlargements of the system of transit throughout the world have given additional importance to the subject. The law by which carriers, both by land and sea, are made responsible for the goods entrusted to them, is founded on the praetorian edict of Hadrian, solemnly recognized by the law of the fourth book of the Pandect. The edict itself is contained in these few words, "nautae, cauponae, stabularii, quod cauponae solvunt fore receperint, nisi restituent, in eos judicium dabo." The simplicity of the rule so announced has had a most beneficial influence on the commerce of the world. Throughout the great civilized region which took its law directly from Rome, and through the other less civilized countries which followed the same commercial code, it laid a foundation for the principle that the carrier's engagement to the public is a contract of indemnity. It bound him in the general case, to deliver what he had been entrusted with, or its value,—thus sweeping away all secondary questions or discussions as to the conditions of more or less culpability on his part under which loss or damage may have occurred; and it left any limitations of this general responsibility to be separately adjusted by special contract.

The law of England recognizes a distinction between a common and a private carrier. The former is one who holds himself out to the public as ready to carry for hire from place to place the goods of such persons as choose to employ him. The owner of a stagecoach, a railway company, the master of a general ship, a wharfinger carrying goods on his own lighters are common carriers; and it makes no difference that one of the termini is the journey part of the man's own property. It has been held, however, that a person who carries only passengers is not a common carrier; nor of course is a person who merely engages to carry the goods of particular individuals or to carry goods upon any particular occasion. A common carrier is subject at law to peculiar liabilities. He is bound to carry the goods of any person who offers to pay his
hire, unless there is a good reason to the contrary, as, for example, when his carriage is full, or the article is not such as he is in the habit of conveying. He ought to carry the goods in the usual course without unnecessary deviation or delay. To make him liable there must be a due delivery of the goods to him in the known course of his business. His charge must be reasonable; and he must not give undue preference to any customer or class of customers. The latter principle, as enforced by statute, has come to be of great importance in the law of railway companies. In respect of goods entrusted to him, the carrier's liability, unless limited by a special contract, is, as already stated, that of an insurer. There is no question of negligence as in the case of injury to passengers, for the warranty is simply to carry safely and securely. The law, however, excepts losses or injuries occasioned immediately "by the act of God or the king's enemies"—words which have long had a strict technical significance. It would appear that concealment without fraud, on the part of the customer, will relieve the carrier from his liability for negligence, but not for actual misfeasance. Fraud or deceit by the customer (e.g., in misrepresenting the real value of the goods) will relieve the carrier from his liability. The responsibility of the carrier ceases only with the delivery of the goods to the proper consignee. By the Carriers' Act 1830 the liability of carriers for goods from London to other parts of England ("the compass") is determined. Should the article or parcel exceed £10 in value, the carrier is not to be liable for loss unless such value is declared by the customer and the carrier's increased charge paid. Where the value is thus declared, the carrier may, by public notice, demand an increased charge, for which he must, if required, sign a receipt. Failing such receipt or notice, the carrier must refund the increased charge and remain liable as at common law. Except as above no mere notice or declaration shall affect a carrier's liability; but he may make special contracts with his customers. The carriage of goods by sea is subject to special regulations (see AFFREIGHTMENT). The carriage of goods by railway and canal is subject to the law of common carrier, except where varied by particular statutes, as the Railway and Canal Traffic Acts 1854 to 1894 and the Regulation of Railways Acts 1840 to 1893. The effect of these acts is to prevent railway companies as common carriers from limiting by special contract their liability to receive, forward and deliver goods, unless the conditions embodied in the special contract are reasonable. A railway company is liable for negligence of its servants or agents in carrying and signing, or on behalf of, the sender. A railway company is also responsible for forwarding passengers' luggage; where luggage is taken into the carriage with a passenger, the company is responsible for it only in so far as loss or damage is due to the passenger's interference with the company's exclusive control of it. As carriers of passengers companies are bound, in the absence of any special contract, to exercise due care and diligence, and are responsible for personal injuries only when they have been occasioned by negligence or want of skill. Where there has been contributory negligence on the part of the passengers, i.e., where he might, by the exercise of ordinary care, have avoided the consequences of the defendants' negligence—he is not entitled to recover. By the act of 1846 (commonly called Lord Campbell's Act), when a person's death has been caused by such negligence as have entitled him to an action had he survived, an action may be maintained against the party responsible for the negligence on behalf of the wife, husband, parent or child of the deceased. Previously such cases had been governed by the maxim actio personalium moritur cum persona.

CARRIÈRE, MORITZ (1817–1895), German philosopher and historian, was born at Griedel in Hess Darmstadt on the 4th of March 1817. After studying at Giessen, Göttingen and Berlin, he spent a few years in Italy studying the fine arts, and established himself in 1842 at Giessen as a teacher of philosophy. In 1853 he was appointed professor at the university of Munich, where he lectured mainly on aesthetics. He died in Munich on the 19th of January 1895. An avowed enemy of Ultramontanism, he contributed in no small degree to making the idea of German unity more palatable to the South Germans. Carrière identified himself with the school of the younger Fichte as one who held the theistic view of the world which aimed at reconciling the contradictions between deism and pantheism. Although no obstinate adherent of antiquated forms and prejudices, he firmly upheld the fundamental tenets of Christianity. His most important works are: *Aesthetik* (Leipzig, 1850; 2nd ed., 1889), supplemented by *Die Kunst im Zusammenhang der Kulturentwicklung und der Ideale der Menschheit* (3rd ed., 1877–1886); *Die philosophische Weltanschauung der Reformationszeit* (Stuttgard, 1847; 2nd ed., Leipzig, 1886), and *Die sittliche Weltordnung* (Leipzig, 1877; 2nd ed., 1891), in which he recognized both the immutability of the laws of nature and the freedom of the will. He described his view of the world and life as "real-idealism." His essay on Cromwell (*Lebensbüsten*, 1890), which may be considered his political confession of faith, also deserves mention. His complete works were published at Leipzig, 14 vols., in 1886–1894.

CARRINGTON, CHARLES ROBERT WYNNE-CARRINGTON, 1st Earl (1843–1911), English statesman, son of the 2nd Baron Carrington (d. 1888), was educated at Eton and Trinity, Cambridge, and sat in the House of Commons as a Liberal for High Wycombe from 1865 till he succeeded to the title in 1868. He was governor of New South Wales 1885–1890, lord chamberlain 1892–1895, and became a member of the board of agriculture in 1905, having a seat in the cabinet in Sir H. H. Asquith's ministry. He was created Earl Carrington and Viscount Wendover in 1895. The Carrington barony was conferred in 1796 on Robert Smith (1752–1838), M.P. for Nottingham, a member of a famous banking family, the title being suggested by one held from 1643 to 1706 in another family of Smith in no way connected. The 2nd baron married as his second wife one of the two daughters of Lord Willoughby de Eresby, and their son, through her, became in 1798 joint hereditary lord great chamberlain of England. The 2nd Baron took the surname of Carrington, afterwards altered to Carrington, instead of Smith.

CARRINGTON, RICHARD CHRISTOPHER (1826–1875), English astronomer, son of a brewer at Brentford, was born in London on the 26th of May 1826. Though intended for the Church, his studies and tastes inclined him to astronomy, and with a view to gaining experience in the routine of an observatory he accepted the post of observer in the university of Durham. Finding, however, that there was little chance of obtaining any substantial results suitable to his ambitious undertakes, he resigned that appointment and established in 1853 an observatory of his own at Redhill. Here he devoted three years to a survey of the zone of the heavens within 9 degrees of the North Pole, the results of which are contained in his *Redhill Catalogue of 3735 Stars*. But his name is chiefly perpetuated through his investigation of the motions of sun-spots, by which he determined the elements of the sun's rotation and made the important discovery of a systematic drift of the photosphere, causing the rotation-periods of spots to lengthen with increase of solar latitude. He died on the 27th of November 1875.

CARROCCIO, a war chariot drawn by oxen, used by the medieval republics of Italy. It was a rectangular platform on which the standard of the city and an altar were erected; priests held services on the altar before the battle, and the trumpeters beside them encouraged the fight to the fray. In battle the carroccio was surrounded by the bravest warriors in the army and it served both as a rallying-point and as the palladium of the city's honour; its capture by the enemy was regarded as an irreparable defeat and humiliation. It was first employed by the Milanese in 1538, and played a great part in the wars of the Lombard league against the emperor Frederick Barbarossa. It was afterwards adopted by other cities, and first appears on
CARRODUS—CARROLL

Florentine battlefield in 1228. The Florentine carroccio was usually followed by a smaller car bearing the martellina, a bell to ring military signals. When war was regarded as likely the martellina was attached to the door of the church of Santa Maria in the Mercato Nuovo in Florence and rung to warn both citizens and enemies. In times of peace the carroccio was in the keeping of some great family which had distinguished itself by signal services to the republic.

Accounts of the carroccio will be found in most histories of the Italian republics; see for instance, M. Villani's Chroniche, vol. 5 (Florence, 1825-1826); P.-Villari, The Two First Centuries of Florentine History, vol. I (Engl. transl., London, 1843); Gino Capponi, Storia della Repubblica di Firenze, vol. I (Florence, 1875).

CARRODUS, JOHN TIPPLADY (1836-1895), English violinist, was born on the 20th of January 1836, at Kidgley, in Yorkshire. He made his first appearance as a violinist at the age of nine, and had the advantage of studying between the ages of twelve and eighteen at Stuttgart, with Wilhelm Bernhard Molique. On his return to England in 1853, Costa got him engagements in the leading orchestras. He was a member of the Covent Garden opera orchestra from 1855, made his début as a solo player at a concert given on the 22nd of April 1863 by the Musical Society of London, and succeeded Sainton as leader at Covent Garden in 1869. He died at Hampstead on the 13th of July 1895. For many years he had led the Philharmonic orchestra and those of the great provincial festivals. He published two violin solos and a “Morceau de salon,” and was a very successful teacher.

CARROLL, CHARLES (1737-1832), American political leader, of Irish ancestry, was born at Annapolis, Maryland, on the 10th of September 1737. He was educated abroad in French Jesuit colleges, studied law at Bourges, Paris and London, and in February 1765 returned to Maryland, where an estate known as “Carrollton,” in Frederick county, was settled upon him; he always signed his name as “Charles Carroll of Carrollton.” Before and during the War of Independence, he was a whig or patriot leader, and as such was a member of the various local and provincial extra-legal bodies—committees of correspondence, committees of observation, councils of safety, provincial convention (1774-1776) and constitutional convention (1776). From 1777 until 1800 he was a member of the Maryland senate. In April-June 1776 he, with Samuel Chase and Benjamin Franklin, was a member of the continental congress sent by the provincial legislatures of the 13 American colonies to join the thirteen revolution colonies. From 1776 to 1779 he sat in the continental congress, rendering important services as a member of the board of war, and signing on the 2nd of August 1776 the Declaration of Independence, though he had not been elected until the day on which that document was adopted. He out-lived all of the other signers. He was a member of the United States Senate from 1789 to 1802. From 1801 until his death, at Baltimore, on the 14th of November 1832, he lived in retirement, his last public act being the formal ceremony of starting the construction of the Baltimore and Ohio railway (July 4, 1838). In politics, after the formation of parties, he was a Federalist. Of unusual ability, high character and great wealth, he exercised considerable influence, particularly among his co-religionists of the Roman Catholic faith, and he used it to secure the independence of the colonies and to establish a stable central government.

See the Life by Kate Mason Rowland (1898).

CARROLL, JOHN (1735-1815), American Roman Catholic prelate, was born at Upper Marlborough, Prince George's county, Maryland, on the 8th of January 1735, the son of wealthy Catholic parents and a cousin of Charles Carroll of Carrollton. He was educated at St Omer's in Flanders, becoming a novitiate in the Society of Jesus in 1753, and then at the Jesuit college in Liège, being ordained priest in 1769 and becoming professor of philosophy and theology. In 1771 he became a professor of the Society of Jesus and professor at Bruges. As tutor to the son of Lord Stourton, he travelled through Europe in 1772-1773. After the papal brief of the 21st of July 1773 suppressed the Society of Jesus, he accompanied its English members then in Flanders to England. In 1774 he returned to America, and set to work at a mission at Rock Creek, Montgomery county, Maryland, where his mother lived. He shared the feeling for independence growing among the American colonists, foreseeing that it would mean greater religious freedom. In 1776, at the request of the continental congress, he accompanied Benjamin Franklin, Charles Carroll and Samuel Chase on their mission to secure the aid or neutrality of the French-Canadians, and though unsuccessful it gained for him the friendship of Franklin. In 1783 he took a prominent part in the petition to Rome to take the control of the American church away from London; and on Franklin's recommendation, Carroll was named prefect apostolic, the American church being recognized as a distinct body in a decree issued by Cardinal Antonelli on the 9th of June 1784. In the summer of 1785 he began his visitations; in 1786 he induced the general chapter to authorize a Catholic seminary (now Georgetown University); and at the same session it was voted that the condition of the church required a bishop, accountable directly to the pope (and not to the Congregation of the Propaganda) and chosen by the American clergy. Consent to this course was given by Antonelli in a letter of the 12th of July 1786. The clergy met at Whitemarsh, Maryland, and Baltimore was chosen as the site for the see; and on the 6th of November 1785 Pius VI. issued a bull to that effect, Carroll being consecrated at Lulworth Castle, England, on the 15th of August 1790.

On his return from England the bishop saw Georgetown College completed (1790), thanks to moneys he had received from English Catholics. His first synod met on the 7th of November 1791; and on the 16th he issued the “Circular on Christian Marriage,” which attacked marriage by any save “lawful pastors of our church.” In 1795 the Rev. Leonard Neale (1746-1817) was appointed his coadjutor. In 1799, after the death of Washington, Bishop Carroll bade his clergy hold the 22nd of February 1800 as a day of mourning, and on that day delivered in his pro-cathedral a memorial discourse which attracted much attention. Already in 1802 he was pressing for the creation of new sees in his diocese, and the Louisiana Purchase of 1803 gave added weight to this request; in September 1805 the Propaganda made him administrator apostolic of the diocese of New Orleans, to which he appointed John Gabriel, later Bishop of Natchitoches; and in 1808 Pius VII. divided Carroll's see into four sees, Boston, New York, Philadelphia and Bardstown (Kentucky), suffragan to the metropolitane of Baltimore, of which Carroll actually became archbishop by the assumption of the long delayed pallium on the 18th of August 1811, having consecrated three suffragans in the autumn of 1810. In 1811 ecclesiastical jurisdiction over the Danish and Dutch West Indies was bestowed upon him. Carroll was now an old man, and the shock of the war of 1812, which as a staunch Federalist he had opposed until its actual declaration, together with the action of the Holy See in appointing to the sees of Philadelphia and New York other candidates than those of his recommendation, weighed on his mind. He died in Georgetown on the 3rd of December 1815. He may well be reckoned the greatest figure in the Roman Catholic Church of the United States. His position in the church had never been easy, partly because he had been a prominent member of the Society of Jesus. The great size of his diocese had made it difficult for him to secure the independence of the American church which had been a difficult one. As a defender of papal and episcopal authority he had, especially in Philadelphia and Baltimore, to deal with churches whose trustees insisted that they and their parishes alone could choose priests, that bishop or prefect could not object to their choice. Akin to this difficulty was the desire of Catholics of different nationalities to have separate churches, a desire often created or encouraged by intriguing and ambitious priests. Besides these and other internal annoyances, Carroll had to meet the deep-seated distrust of his church in communities settled almost exclusively by Protestants.

and Daniel Brent. Biographical Sketch of the Most Rev. John Carroll, First Archbishop of Baltimore, with Select Portions of His Writings, edited by John Carroll Brent (Baltimore, 1843).

**CARRONADE**, a piece of ordnance invented, by the application of an old principle of gun construction, to serve as a ship’s gun. The invention was the army of Robert Melville (1728–1808). He designed the piece in 1759, and called it the “smasher,” but it was not adopted in the British navy till 1779, and was then known as the “carronade,” from the Carron works on the Carron river in Stirlingshire, Scotland, where it was first cast by Mr. Gascoigne. The carronade had a powder chamber like many of the earliest guns known, and was similar to a mortar. It was short, light, had a limited range, but was destructive at close quarters. Carronades were added to the existing armaments of guns proper or long guns. A 38-gun frigate carried ten carronades, and was therefore armed with 48 pieces of ordnance. As the official classifications were not changed, they were misleading guides to the real strength of British ships, which always carried more pieces than they were described as carrying. The same remark applies to French and American ships when the use of the carronade extended from the British to other navies.

**CARRONADE—CARSON**

**CARRONADE.** Wild carrot, *Daucus carota*, a member of the natural order Umbelliferae, grows wild in fields and on roadsides and sea-shores in Britain and the north temperate zone generally of the Old World. It is an annual and resembles the cultivated carrot, except in the root, which is thin and woody. It is the origin of the cultivated carrot, which can be developed from it in a few generations. M. Vilmorin succeeded in producing forms with thick fleshy roots and the biennial habit in four generations. In the cultivated carrot, during the first season of growth, the stem remains short and bears a rossette of graceful, long-stalked, branched leaves with deeply cut divisions and small, narrow ultimate segments. During this period the plant devotes its energies to storing food, chiefly sugar, in the so-called root, which consists of the upper part of the true root and the short portion of the stem between the root and the lowest leaves. A transverse section of the root shows a central core, generally yellow in color, and an outer red or scarlet rind. The core represents the wood of an ordinary stem and the outer ring the soft outer tissue (bast and cortex). In the second season the terminal bud in the centre of the leaf-roseate grows at the expense of the stored nourishment and lengthens to form a furrowed, rather rough, branched stem, 2 or 3 ft. high, and bearing the flowers in a compound umbel. The umbel is characterized by the fact that the small leaves (bracts) which surround it resemble the foliage leaves on a much reduced scale, and ultimately curve inwards, the whole inflorescence forming a nest-like structure. The flowers are small, the outer white, the central ones often pink or purplish, and are in two one-seeded portions, each portion bearing four rows of stiff spiny projections, which cause the fruits when dropped to cling together, and in a natural condition help to spread the seed by clinging to the fur of animals. On account of these projections the seeds cannot be sown evenly without previous rubbing with sand or dry ashes to separate them. As usual in the members of the order Umbelliferae, the wall of the fruit is penetrated lengthwise by canals containing a characteristic oil.

Carrots vary considerably in the length, shape and color of their roots, and in the proportion of rind to core. The white Belgian, which gives the largest crops, has a very thick root which is white, becoming pale green above, where it projects above ground. For nutritive purposes it is inferior to the red varieties. The carrot delights in a deep sandy soil, which should be well drained and deeply trenched. The ground should be prepared and manured in autumn or winter. For the long-rooted sorts the soil should be at least 3 ft. deep, but the short Horn varieties may be grown in about 6 in. of good compost laid on the top of a less suitable soil. Peat earth may be usefully employed in lightening the soil. Good carrots of the larger sorts may be grown in unfavourable soils by making large holes 18 in. deep with a crowbar, and filling them up with sandy compost in which the seeds are to be sown. The main crop is sown at the end of March or beginning of April. After sowing, it is only necessary to thin the plants, and keep them clear of weeds. The roots are taken up in autumn and stored during winter in a cool shed or cellar.

**CARRYING OVER, or CONTINUATION,** a stock exchange term for the operation by which the settlement of a bargain transacted for money or for a given account, may for a consideration (called either a “contango” or a “backwardation”) be postponed from one settling day to another. Such a continuation is equivalent to a sale “for the day” and a repurchase for the succeeding account, or to a purchase “for the day” and a resale for the succeeding account. The price at which such transactions are adjusted is the “making-up” price of the day. (See ACCOUNT and STOCK EXCHANGE.)

**CARSIOLI** (mod. *Carsoli*), an ancient city of Italy, on the Via Valeria, 42 m. E. by N. of Rome. It was founded in the country of the Aequi between 320 and 298 B.C., just after the establishment of Alba Fucens, no doubt as a stronghold to guard the road to the latter. It is mentioned in 211 B.C. as one of the twelve out of thirty Latin colonies which protested their inability to furnish more men or money for the war against Hannibal. We find it used in 165 B.C. like Alba Fucens as a place of confinement for political prisoners. It was sacked in the Social War, but probably became a municipium after it, though we hear but little of it. The modern town of Carsoli first appears in a diploma of A.D. 210. The site of old Carsoli does not seem to have been abandoned until the 11th century. It is now occupied only by vineyards, and lies about 2100 ft. above sea-level, in a plain surrounded by mountains, now called Piano del Cavalliere. The line of the city walls (originally in tufa, and reconstructed in limestone), built of rectangular blocks, can be traced, and so can the scanty remains of several buildings, including the podium or base, of a temple, and also the ancient branch road from the Via Valeria (which itself keeps just south-east of Carsoli), traversing the site from north to south. The forty-third milestone of the Via Valeria still lies at or near its original site; it was set up by Nerva in A.D. 97. One mile to the north-west of Carsoli are the remains of an ancient aqueduct consisting of a buttressed wall of concrete crossing a valley.

See G. J. Pfeiffer and T. Ashby in Supplementary Papers of the American School in Rome, i. (1905), 168 seq. (T. A. S.)

**CARSIOLI** (mod. *Carsoli*) (1680–1686), American hunter and scout, was born in Madison county, Kentucky, on the 24th of December 1800. When he was a year old his parents removed to Howard county, Missouri, then a frontier settlement, and the boy was early trained in the hardships and requirements of pioneer life. He served for a while as a sadder’s apprentice, and after 1826, devoted himself to the life of a professional guide and hunter. He was hunter for the garrison at Bent’s Fort on the Arkansas river in what is now Bent county, Colorado, from 1832 to 1840, and accompanied John C. Frémont on his exploring expeditions of 1842 and 1843–1844, and on his California expedition in 1845–1846. Carson took part in the Mexican War, and, after the rush to the Pacific Coast began, engaged as a guide to convey emigrants and drovers across the plains and mountains. In 1854 he became Indian agent at Taos, New Mexico, in which position, through his knowledge of the Indian traits and language, he was able to exercise for many years a restraining influence over the warlike Apaches and other tribes. During the Civil War he rendered invaluable services to the Federal cause in the south-west as chief scout in charge of the various bodies of irregular scouts and rangers participating in the constant border warfare that characterized the conflict in that part of the Union. In March 1865 he was brevetted brigadier-general of volunteers for gallantry in the battle of Valverde (on the 21st of February 1862) and for distinguished services in New Mexico, and after the war resumed his position as Indian agent, which he held until his death at Fort Lyon, Colorado, on the 23rd of May 1868.

Kit Carson occupied a position in the latter portion of American pioneer history a position somewhat similar to that held by Daniel Boone and David Crockett at an earlier period, as the typical frontier
hero and Indian fighter, and his hairbreadth escapes and personal prowess are the subject of innumerable stories.

See Charles Burdett, Life of Kit Carson, the Great Western Hunter and Guide (New York, 1850; new ed., 1877); and De Witt C. Peters, The Life and Adventures of Kit Carson, the Nester of the Rocky Mountains, from Facts Narrated by Himself (New York, 1858).

CARSON CITY, the capital of Nevada, U.S.A., and the county seat of Ormsby county, about 120 m. N.E. of Sacramento, California. Pop. (1890) 3950; (1900) 2100; (1910) 2466. It is served by the Virginia and Truckee railway, which has repair shops here, and by stage to Lake Tahoe, 12 m. W. of the city. It is picturesquely situated in Eagle valley, near the east base of the Sierra Nevada, at an elevation of 4720 ft. above the sea. Within 1 m. of the city are Shaws Hot Springs. The city is a distributing point for the neighbouring mining region. Among the public buildings are the capitol, the United States government building, a United States mint, and a state orphans' home; in the vicinity are the state prison and a United States government school for Indians. The industrial interests of the city are principally in mining, lumbering and agriculture. It has an excellent supply of mountain spring water. Carson City (named in honour of Christopher Carson) was settled in 1851 as a trading post, was laid out town in 1859, and was made the county seat when the county of the newly erected county was in 1861, and was chartered as a city in 1875.

CARSTARES (or CARSTAIRS), WILLIAM (1649-1715), Scottish clergyman, was born at Cathcart, near Glasgow, on the 11th of February 1649, the son of the Rev. John Carstares, a member of the extreme Covenanting party of Protestants. He was educated at the university of Edinburgh, and then passed over to Utrecht, where he commenced his lifelong friendship with the prince of Orange, and began to take an active part in the politics of his country. The government disliked Carstares for several reasons. He was the intimate of William; he had been the bearer of messages between the disaffected in Scotland and Holland; and he was believed to be concerned with Sir James Stuart (1635-1715) in the authorship of a pamphlet—An Account of Scotland's Grievances by reason of the D. of Lauderdale's Ministris, humbly tendered to his Sacred Majesty. Accordingly, on his return to England, at the close of 1674, he was committed to the Tower; the following year he was transferred to Edinburgh Castle, and was not till August 1676 that he was released. After this he visited Ireland, and then became pastor to a Non-conformist congregation at Cheshunt. During 1682 he was in Holland, but in the following year he was again in London, and was implicated in the Rye House Plot. On its discovery he was examined before the Scottish Council; though the torture of the thumb-screw was applied, he refused to utter a word till he was assured that his admissions would not be used in evidence, and in the disclosures he then made he displayed great discretion. On his return to Holland he was rewarded by William's still warmer friendship, and the post of court chaplain; and after the Revolution he continued to hold this office, under the title of royal chaplain for Scotland. He was the confidential adviser of the king, especially with regard to Scottish affairs, and rendered important service in promoting the Revolution Settlement. On the accession of Anne, Carstares retained his post as royal chaplain, but resided in Edinburgh, having been elected principal of the university. He was also minister of Greyfriars', and afterwards of St Giles', and was four times chosen moderator of the general assembly. He took an important part in promoting the Union, and was consulted by Harley and other leading Englishmen concerning it. During Anne's reign, the chief object of his policy was to frustrate the measures which were planned by Lord Oxford to strengthen the Episcopal Jacobites—especially a bill for extending the privileges of the Episcopalians and the bill for replacing in the hands of the old patrons the right of patronage, which by the Revolution Settlement had been vested in the elders and the Protestant heritors. On the accession of George I, Carstares was appointed, with five others, to welcome the new dynasty in the name of the Scottish Church. He was received graciously, and the office of royal chaplain was again conferred upon him. A few months after he was struck with apoplexy, and died on the 26th of December 1735.

See State-papers and Letters addressed to William Carstares, to which is prefixed a Life by M'Cormick (1774); Story's Character and Career of William Carstares (1784); Andrew Lang's History of Scotland (1907).

CARSTENS, ARMUS JACOB (1754-1798), German painter, was born in Schleswig, and in 1776 went to Copenhagen to study. In 1783 he went to Italy, where he was much impressed by the work of Giulio Romano. He then settled in Lübeck as a portrait painter, but was helped to visit Rome again in 1792, and gradually produced some fine subject and historical paintings, e.g. "Plato's Symposium" and the "Battle of Rossbach"—which made him famous. He was appointed professor at Berlin, and in 1795 a great exhibition of his works was held in Rome, where he died in 1798. Carstens ranks as the founder of the later school of German historical painting.

CARSULAE, an ancient city of Umbria, on the Via Flaminia, 19 m. N. of Narnia (mod. Narni) and 24 m. S.S.W. of Mevania (mod. Bevagna). It is little mentioned in ancient literature. The town was a municipium. The Via Flaminia is well preserved and enters the north gate of the town, the archway of which still stands. To the north of the town is a partly excavated site, and the outline of an amphitheatre is visible. The town of Cesi, 3 m. to the south-east, has polygonal walls, and may perhaps be regarded as an Umbrian city which was destroyed by the Romans, Carsulae being constructed in its stead. The medieval city, as so often happened in Italy, returned to the pre-Roman site.

See G. Gamurrini in Notizie degli Scavi (1884), 140; for the tombs, L. Lanzu, in Notizie degli Scavi (1902), 592.

CART (A.S. craet, Gaelic cairt; connected with "car"), a general term for various kinds of vehicles (see CARRIAGE), in some cases for carrying people, but more particularly for transporting goods, for agricultural or postal purposes, &c., or for carriers. Though constructed in various ways, the simplest type for goods is two-wheeled, topless and springless; but as a general term "cart" is used in combination with some more specific qualification (dog-cart, donkey-cart, road-cart, polo-cart, &c.), when it is employed for pleasure purposes. The "dog-cart," so called because originally used to convey sporting dogs, is a more or less elevated two-wheeled carriage, generally with scats back to back, in front of which children are sometimes seated (presumably so called from its use for children), a very low two-wheeled pony-carriage, has two side seats facing inwards; the "tax-cart," a light two-wheeled farmer's cart, was so called because formerly exempted from taxation as under the value of £21.

CARTAGENA, or CARTAGENA, a city, seaport, and the capital of the department of Bolivar, Colombia, South America, on the Caribbean coast, in 10° 25' 48" N., 75° 34' W. Pop. (1905, official estimate) 14,000. The population of Cartagena is largely composed of blacks and mixed races, which form the predominant type on the lowland plains of northern Colombia. The well-to-do whites of Cartagena usually have country houses on the Turabo hills, where the temperature is much lower than on the coast. The mean annual temperature in the city is 82°, and the port is classed as very unhealthful, especially for unacclimatized foreigners. The harbour, which is the best on the north coast of South America, is formed by an indentation of the coastline shut in by two long islands lying parallel to the mainland. It covers an area of about 62-5 sq. m. and affords deep and secure anchorage and sheltered harbours for large vessels. The city itself has no modern quays, and large vessels do not approach within a mile of its landing-stage, but the railway pier (lengthened 120 ft. in 1808) on the mainland opposite permits the mooring of vessels alongside. There were formerly two entrances to the harbour—the Boca Grande (large mouth) between the low sandy island or peninsula on which the city stands and the island of Tierra Bombe, and the Boca Chica (small mouth) at the south end of the latter island. The Boca Grande was filled with stone after the city had been captured three times, because of the ease with which an enemy's ships could pass through it at any time, and the narrow and more

which of taken it Philip during concession of Spain, Sir quarters of the largest cathedral barred brick tramway works; f land suburb 412 CARTAGENA, The figured was same year. of the same terminus Northern platinum. of the Mediterranean the above ships made by the English company received a concession to bring water by pipes from springs on the Turbaco hills, 300 ft. above the sea.

The commercial importance of Cartagena declined greatly during the period of civil disorders which followed the war for independence, but in later years has revived. In the reign of Philip II. the Spaniards had opened a canal ("El Dique") through some marshes and lagoons into a small western outlet of the Magdalena, which gave access to that river at Calamar, about 81 m. above the bar at its mouth; during Cartagena's decline this was allowed to fill up; it was reopened in 1846 for a short time and then was obstructed again by river floods; but in 1881 it was reopened for steam navigation. Towards the end of the 19th century a railway, 65 m. long, was built between Cartagena and Calamar. Imports consist of cotton, linen and woollen fabrics, hardware, cutlery and machinery, kerosene, glass and earthenware; and the exports of cattle, sugar, tobacco, coffee, coco-nuts and fibre, dividivi and dye-woods, vegetable ivory, rubber, hides and skins, medicinal forest products, gold, silver and platinum. The aggregate value of the exports in 1906 was $3,788,004 U.S. gold.

Cartagena was founded in 1533 by Pedro de Heredia. In 1544 it was captured by pirates, who plundered the town; in 1585 by Sir Francis Drake, who exacted a large ransom; and in 1607 by the British. It was recaptured from them in 1613. In 1741 Admiral Vernon unsuccessfully besieged the town. It was taken by Bolivar in 1815, but was surrendered to the royalists in the same year. It was recaptured by the republicans on the 25th of September 1821, and thereafter remained in their possession. It figured prominently in the political agitations and revolutions which followed, and underwent a siege in the civil war of 1885. It was an important naval station under Spanish colonial rule, and is the principal naval station of Colombia.

CARTAGENA, or Cartagena, a seaport of south-eastern Spain, in the province of Murcia; in 37° 36' N. and 0° 58' W., at the terminus of a branch railway from the city of Murcia, and on the Mediterranean Sea. Pop. (1900) 99,871. Cartagena is fortified, and possesses an arsenal and naval dockyards. Together with Ferrol and San Fernando near Cadiz, the other great naval stations of Spain, it is governed by an admiral with the title of captain-general. It has also an episcopal see.

The city stands on a hill separated by a little plain from the harbour; towards the north and east it communicates with a fertile valley; on the south and west it is hemmed in by high mountains. Its grey houses have a neglected, ramshackle, disfigured appearance, from the friable stone of which they are constructed; and there are no buildings of antiquarian interest or striking architectural beauty, except, perhaps, the ruined citadel and the remnants of the town walls. The wide streets are traversed by a system of tramways, which pass through modern suburbs to the mining district about two leagues inland, and on the west a canal enables small vessels to enter the town without using the port. The harbour, the largest in Spain after that of Vigo, and the finest on the east coast, is a spacious bay, deep, except near its centre, where there is a ledge of rock barely 5 ft. under water. It is dominated, on the seaward side, by four hills, and approached by a narrow entrance, with forts on either hand; a breakwater affords shelter on the east, and on the west is the Arsenal Basin, often regarded as the original harbour of the Cartaginians and Romans. The island called La Escombrera, the ancient Scornobria (i.e. "mackerel fishery", 21 m. south, protects Cartagena from the violence of wind and waves.

The mines near the city are very extensive, and vast numbers of men and beasts are employed in transporting lead, iron, copper, zinc and sulphur to the coast. The industrial and commercial progress of Cartagena was much hindered, during the first half of the 19th century, by the prevalence of epidemic diseases, the abandonment of the arsenal, and rivalry with the neighbouring port of Alicante. Its sanitary condition, though still defective, was improved by the drainage of the adjacent Almajar Marsh; and after 1870, when the population had dwindled to about 26,000, Cartagena advanced rapidly in size and wealth. The opening of the railway enabled it to compete successfully with Alicante, and revived the mining and metallurgical industries, while considerable sums were expended on bringing the coast and land defences up to date, and adding new quays, docks and other harbour works. As a naval station, Cartagena suffered severely in 1808 from the maritime disasters of the Spanish-American War; and its commerce was much affected when, at the beginning of the same year, Porman, or Portman, a mining village on a well-sheltered bay about 11 m. east, was declared by royal order an independent port. Vessels go to Porman to land coke and coal, and to load iron ore and lead. From Cartagena the principal exports are metallic ores, esparto grass, wine, cereals and fruit. Esparto grass, which grows freely in the vicinity, is the spartum, or Spanish broom, which gave the town its Roman designation of Cartago Spartaria. It is still used locally for making shoes, ships' cables, mats and a kind of spun cloth. Timber is largely imported from the United States, Sweden and Russia; coal from Great Britain; dried codfish from Norway and Newfoundland. In 1904, exclusive of coasters and small craft trading with north-west Africa, 562 ships of 604,208 tons entered the port of Cartagena, 253 being British and 130 Spanish; while 96 vessels were accommodated at Portman.

Cartagena was founded about the year 243 B.C. by the Carthaginian Hasdrubal, and was called Cartago Nova or New Cartagena. To distinguish it from the Carthaginian Carthago. It was conveniently situated opposite to the Carthaginian territories in Africa, and was early noted for its harbour. Its silver and gold mines were the source of great wealth both to the Carthaginians and to the Romans. In 210 B.C. this important place, the headquarters and treasure city of the Punic army, was stormed and taken with great slaughter by P. Scipio. The city continued to flourish under the Romans, who made it a colony, with the name Colonia Victrix Julia Nova Cartago. In A.D. 425 it was pillaged and nearly destroyed by the Goths. Cartagena was a bishopric from about 400 to 1280, when the see was removed to Murcia. Under the Moors it became an independent principality, which was destroyed by Ferdinand II. of Castile in 1243, restored by the Moors, and finally conquered by James I. of Aragon in 1276. It was rebuilt by Philip II. of Spain (1527-1558) for the sake of its harbour. In 1585 it was sacked by an English fleet under Sir Francis Drake. In 1706, in the War of the Spanish Succession, it was occupied by Sir John Leake; and in the next
year it was retaken by the duke of Berwick. On the 5th of November 1823 it capitulated to the French. In consequence of the insurrection in Spain, Cartagena was in 1844 again the scene of warfare. On the 27th of August 1875 it was besieged by the Spanish fleet under Admiral Lobos; on the 12th of October a battle took place off the town, between the ships of the government and the rebels, and on the 12th of January 1874 Cartagena was occupied by the government troops.

See Biblioteca histórica de Cartagena, by G. Vicent y Portillo (Madrid, 1889, &c.): Fechos y fechas de Cartagena, by I. Martinez Rio (Cartagena, 1894); and Série de los obispos de Cartagena, by P. Díaz Casson (Madrid, 1895).

CARTAGO, the capital of the province of Cartago, in Costa Rica, Central America; 13 m. E.S.E. of San José by the transcontinental railway. Pop. (1906) 5,436. Cartago is built on 490 ft. above sea-level, on the fertile and beautiful plateau of San José, and at the southern base of the volcanic Irazú (11,200 ft.). Some of its older buildings, especially the churches, are of considerable interest; but all bear marks of the volcanic disturbances from which the town has suffered on many occasions—notably in 1723, when it was nearly overwhelmed by the bursting of the flooded crater of Irazú, and in 1841, when it was shaken by an earthquake. There are hot spring minerals much frequented by invalids at Bella Vista, a suburb connected with the town by a tramway 3 m. long. The local trade is chiefly in coffee, the quality of which is rapidly deteriorated in the hot volcanic soil of the neighbourhood. Cartago is said to have been in existence as early as 1522; it was probably named in 1563 by the Spaniard Vazquez de Coronado, to whom its foundation is often ascribed.

Though several times plundered by buccaneers, it retained its importance as the capital of Costa Rica until 1823, when it is said by tradition to have contained 30,000 inhabitants. Its prosperity rapidly diminished after the transference of the seat of government to San José, in 1823, but somewhat revived with the development of railways after 1871.

CARTE, THOMAS (1686-1754), English historian, was born at Dusmon, near Clifton. He was educated at Oxford, and was first brought into notice by his controversy with Dr Henry Chandler regarding the Irish massacre, in which he defended Charles I. His attachment to the Stuarts also caused him to remain a non-juror, and on the discovery of the plot of Atterbury, whose secretary he was, he was forced to flee to France. There he collected materials for an English edition of De Thou and Rigault, which were purchased and published by Dr Mead. Being recalled to England through the influence of Queen Caroline, he published, in 1738, A General Account of the Necessary Materials for a History of England. The first volume of his General History of England, which is only of value for its vast and careful collection of facts, was published in 1747. By the insertion in it of the statement that the king's evil had been cured by the Pretender, Carte forfeited the favour of most of his patrons. He, however, continued to publish; and the 2nd volume appeared in 1750, the 3rd in 1752, the 4th in 1755. He published also a Life of James, duke of Ormond, containing a collection of letters, &c. (3 vols., 1735-1736; new ed., in 6 vols., Oxford, 1831), and a History of the Revolutions of Portugal, with letters of Sir R. Southwell during his embassy there (London, 1740). His papers became the property of the university of Oxford, and were deposited in the Bodleian library.

CARTER, ELIZABETH (1717-1806), English poet and translator, daughter of the Rev. Nicholas Carter, was born at Deal, in Kent, on the 16th of December 1717. Dr Carter educated his children, boys and girls, alike; but Elizabeth's slowness tried his patience, and it was only by great perseverance that she conquered her natural incapacity for learning. She studied late at night and early in the morning, taking snuff and chewing green tea to keep herself awake; thus causing severe injury to her health. She learned Greek and Latin, and Dr Johnson said concerning a celebrated scholar that he "understood Greek better than any one whom he had ever known except Elizabeth Carter." She learned also Hebrew, French, German, Italian, Spanish, Portuguese, and lastly some Arabic. She studied astronomy, ancient geography, and ancient and modern history. Edward Cave was a friend of Dr Carter, and in 1734 translated his "Eliza," an essay in the Gentleman's Magazine, which became one of his standard works. In 1738 Cave published her Poems upon Particular Occasions; in 1739 she translated from the French an attack on Pope's Essay on Man by J. P. de Crussol; and in the same year appeared her translation from the Italian of Algarotti's New-tonism per il Danone, under the title of Sir Isaac Newton's Philosophy explained for the use of the Ladies, in six Dialogues on Light and Colour. Her translation of Epicetus (1758) was undertaken in 1749 to please her friends, Thomas Secker (afterwards archbishop of Canterbury) and his niece, Catherine Talbot, to whom the translation was sent, sheet by sheet, as it was done. In 1762 Miss Carter printed a second collection of Poems on Several Occasions. Her letters to Miss Talbot contain an account of a tour on the continent undertaken in 1763 in company with Edward and Elizabeth Montagu and William Pulteney, 1st Earl of Bath. Dr Carter, from 1762 to his death in 1774, lived with his daughter in a house at Deal, which she had purchased. An annuity was settled on her by Sir William Pulteney and his wife, who had inherited Lord Bath's fortune; and she had another annuity from Mrs Montagug. Among Miss Carter's friends and correspondents were Samuel Johnson, Horace Walpole, Samuel Richardson, Mrs Barker, John Burke, Hannah More, and Elizabeth Veseey, who was a leader of literature for society. She died in Chares Street, Piccadilly, on the 19th of February 1806.

Her Memoirs were published in 1807; her correspondence with Miss Talbot and Mrs Veseey in 1809; and her letters to Mrs Montagu in 1817. See also A Woman of Wit and Wisdom (1906), by biography of Alice C. C. Gaussem.

CARTERET, SIR GEORGE (c. 1610-1680), English politician, was born between 1609 and 1617 on the island of Jersey, where his family had long been prominent landholders. He was the son of John Carteret of St Ouen, and in his youth was trained to follow the sea. In 1639 he became comptroller of the English navy. During the Civil War he was active in behalf of the king. In 1643 he succeeded by reversion from his uncle, Sir Philip Carteret, to the post of bailiff of Jersey, and in the same year was appointed by the king lieutenant-governor of the island. After subduing the Parliamentary party in the island, he was commissioned (1644) a vice-admiral of Jersey and "the maritime parish adjutant," and by virtue of that office he carried on there an active privateering campaign in the Royalist cause. Parliament branded him as a pirate and excluded him specifically from future amnesty. His rule in Jersey was severe, but profitable to the island; he developed its resources and made it a refuge for Royalists, among whom in 1646 and again in 1659-1650 was Prince Charles, who created Carteret a knighthood and baronet. In 1650, in consideration of Carteret's services, Charles granted him "a certain island and adjacent islets near Virginia, in America," which were to be called New Jersey; but no settlement upon this grant was made. In 1651 Carteret, after a seven weeks' siege, was compelled to surrender Jersey to a Parliamentary force; he then joined the Royalist exiles in France, where for a time he held a command in the French navy. He returned to England at the Restoration, became a privy councillor, sat in parliament for Portsmouth, and also served as vice-chamberlain of the royal household, a position to which he had been appointed in 1647. From 1661 to 1667 he was treasurer of the navy. He rendered valuable service during the Dutch War, but his lax methods of keeping accounts led to his being censured by parliament. In 1667 he became a deputy treasurer of Ireland. He continued nevertheless in the royal favour, and subsequently was appointed one of the commissioners of the admiralty and a member of the board of trade and plantations. He belonged to that group of courtiers interested in the colonization of America, and was one of the eight to whom Charles II. granted the country of the Carolinas by the charters of 1663 and 1665. In 1664 James, duke of York, granted that part of his American territory between the Hudson and Delaware rivers to Sir George Carteret.
and John, Lord Berkeley, and in Carteret’s honour this tract received the name of New Jersey. Sir George’s relative, Philip Carteret (d. 1658), was sent over as governor in 1665, but was temporarily deposed in 1672 by the discontented colonists, who chose James Carteret (perhaps a natural son of Sir George) as “president.” Philip Carteret was restored to his office in 1674. In this year Lord Berkeley disposed of his share of the grant, which finally fell under the control of William Penn and his associates. With them Carteret agreed (1676) upon a boundary line which divided the colony into East and West Jersey. He died in January 1680, and two years later his heirs disposed of his New Jersey holdings to Penn and other Quakers.

**CARTESIANISM**1, the general name given to the philosophy developed principally in the works of Descartes, Malebranche and Spinoza. It is impossible to exhibit the full meaning of these authors except in connexion, for they are all ruled by one and the same thought in different stages of its evolution. It may be true that Malebranche and Spinoza were prepared, the former by the study of Augustine, the latter by the study of Jewish philosophy, to draw from Cartesian principles consequences which Descartes never anticipated. But the foreign light did not alter the picture on which it was cast, but only let it be seen more clearly. The principle based on an analysis of the word, a partner of the modern spirit. He was equally moved by the tendencies that produced the Reformation, and the tendencies that produced the revival of letters and science. Like Erasmus and Bacon, he sought to escape from a transcendent and unreal philosophy of the other world, to the knowledge of man and the world he lives in. But like Luther, he found within human experience, among the matters nearest to man, the consciousness of God, and therefore his renunciation of scholasticism did not end either in materialism or in that absolute distinction between faith and reason which inevitably leads to the downfall of faith. What was peculiar to Descartes, however, was the speculative interest which made it impossible for him to rest in mere experience, whether of things spiritual or of things secular, which made him search, both in our consciousness of God and our consciousness of the world, for the links by which they are bound to the consciousness of self. In both cases it is his aim to go back to the beginning, to retrace the unconscious process by which the world of experience was built up, to discover the hidden logic that connects the different parts of the world into a system, all whose elements are independent, for an unreasoned congeries of opinions. Hence his first step involves reflection, doubt and abstraction. Turning the eye of reason upon itself, he tries to measure the value of that collection of beliefs of which he finds himself possessed; and the first thing that reflection seems to discover is its accidental and unconnected character. It is a mass of incongruous materials, accumulated without system and tested. Its elements have been put together under all kinds of influences, without any con-

1 For biographical details see DESCARTES; MALEBRANCHE; SPINOZA.
the individual human subject does not affect the nature of self-consciousness in itself or in its relation to knowledge. The force of Descartes’s argument really lies in this, that the world as an intelligible world exists only for a conscious self, and that therefore the subjective act of being and self-consciousness is presupposed in all knowledge. Of this self it is true to say that it exists only as it thinks, and that it thinks always. Cogito, ergo sum is, as Descartes points out, not a syllogism, but the expression of an identity which is discerned by the simple intuition of the mind. If it were otherwise, it would be impossible to prove that we would have been known before the minor “cogito”; whereas on the contrary, it is from the immediate consciousness of being as contained in self-consciousness that that major can alone be derived. Again, when Hobbes and Leibnitz or Descartes in the dualism of a material substance, Descartes answers that the question whether the material and the thinking substance are one does not meet us at the outset, but can only be solved after we have considered what is involved in the consciousness or something essentially or directly.2 In other words, to begin by treating thinking as a quality of a material substance, is to go outside of the intelligible world for an explanation of the intelligible world. It is to ask for something prior to this, which is first in thought. If it be true that self-consciousness is that from which we cannot abstract, that which is involved in the knowledge of anything, then to go beyond it and seek for a reason or explanation of it in anything else is to go beyond the beginning of knowledge; it is to ask for a knowledge before knowing what the knowledge is.

Descartes, however, is himself unfaithful to this point of view; for, strictly taken, it would involve the consequence, not only that there is nothing prior to the pure consciousness of self, but that there is nothing that is not contained in the consciousness of self. Hence there can be no absolute opposition between thought and anything else, no opposition which thought itself does not transude. But Descartes commits the error of making thought the property of things. Such, however, is not the case. A thing is a “thing in itself,” an object out of all relation to the subject; and on the other hand, mind seems to be shut up in the magic circle of its own ideas, without any capacity of breaking through the circle or apprehending any reality but itself. Between thought and being, in spite of their reciprocal unity in self-consciousness, a great gulf seems still to be fixed, which cannot be crossed unless thought should become extended, or matter think. But to Descartes the dualism is absolute, because it is a presupposition with which he starts. Mind cannot go out of itself, cannot deal with anything but thought, without ceasing to be mind; and matter must cease to be matter if it can lose its absolute externality, its nature as having partes extra partes, and acquire the unity of mind. They must both be indivisible and indivisible, and there can be no possible existence of matter in thought except a representative existence. The ideal (or, as Descartes calls it, objective) existence of matter in thought and the real (or, as Descartes calls it, formal) existence of matter are out of thought are absolutely different and independent things.

It was, however, impossible for Descartes to be content with a subjective idealism that confined all knowledge to the teleological expression of self-consciousness “I am.”

Proof of existence of God.

“What I perceive I perceive.” If the individual is to find in his self-consciousness the principle of all knowledge, there must be something in it which transcends the distinction of self and not self, which carries him beyond the limit of his own individuality. What then is the point where the subjective consciousness passes out into the objective, from which it seemed at first absolutely excluded? Descartes answers that it is through the connexion of the self with the consciousness of self with the consciousness of God. It is because we find God in our minds that we find anything else. The proof of God’s existence is therefore the hinge on which the whole philosophy turns, and it is necessary to examine the nature of it somewhat closely.

Descartes, in the first place, tries to extract a criterion of truth out of the cogito, ergo sum. Why am I assured of my own existence? It is because the conception of existence is at once immediately involved in the consciousness of self. I can logically distinguish the two elements, but I cannot separate them; whenever I clearly and distinctly conceive the one, I am forced to think the other along with it. But this gives me a rule for all judgments whatever, a principle which is related to the cogito, ergo sum as the formal to the material principle of knowledge. Whatever we cannot separate from the clear and distinct conception of anything necessarily belongs to it in reality, and on the other hand, whatever we can separate from the clear and distinct conception of anything, does not necessarily belong to it in reality. Let us therefore set an object clearly before us, let us sever it in thought so far as is possible from all other objects, and we shall at once be able to determine what properties and relations are essential and what are not essential to it. And if we find empirically that any object manifests a property or relation not involved in the clear and distinct conception of it, we can say with certainty that such property or relation does not belong to it except by arbitrary arrangement, or, in other words, by the external combination of things which in their own nature have no affinity or connexion.

Now, by the application of this principle, we might at once assure ourselves of many mathematical truths; but, as has been already shown, there is a point of view from which we may doubt even these, so long as the idea of a God that deceives us is not excluded. If it is not certain that there is a God that cannot lie, it is not certain that there is an objective matter in space to which mathematical truth applies. But the existence of God may be proved in two ways. In the first place, it may be proved from the properties of the idea of the self, which is a subjective property, and to which we have just referred. We have in our mind many ideas, and according to the principle of causality, all these ideas must be derived from something that contains a “formal” reality which corresponds to their “objective” reality, i.e., which contains at least as much reality in its existence out of thought as they contain in their existence in thought. Now we might derive from ourselves not only the ideas of other minds like ourselves, but possibly also of material objects, since these are lower in the scale of existence than ourselves, and it is conceivable that the idea of them might be got by omitting some of the qualities which distinguish ourselves. But the idea of God, of a being who is eternal and immutable, all-powerful, all-wise, and all-good, cannot be derived from our own limited and imperfect existence. The origin, therefore, must be sought in a being in which contains actually that which is contained in our idea of him.

It was objected by some of the critics of Descartes that the idea of God, being finite in itself, is merely negative, and that it is derived from the finite simply by abstraction. Descartes’s metaphysics. 4i5

Descartes answers that the case is just the reverse—the infinite is the positive idea, and the finite is the negative, and therefore the former is the presupposition of the latter. As we apprehend, at a term, a general conception, abstraction from the ideas of particular spaces, and representing the common element in them, but that, on the contrary, the ideas of particular spaces are got by the limitation of the one which comprises the universal, so Descartes maintains in the general that the idea of the finite is had only by limitation of the infinite, and not the idea of the infinite by abstraction from the particular determinations of the finite. It is a necessary consequence of this that the self-consciousness of a finite being is bound up with the consciousness of the infinite. Hence the idea of God is not merely one among other ideas which we have, but it is the one idea that is necessary to our very existence as thinking beings, the idea through which we can know ourselves as finite beings, or anything else. “I ought never to suppose,” says Descartes, “that my conception of the infinite is a negative idea, got by negation of the finite, just as I conceive repose to be merely negation of movement, and darkness merely the negation of light. On the contrary, I see manifestly that the self-consciousness of a finite being is bound up with the consciousness of the infinite.”

CARTESIANISM

ourselves at all, or we should be conscious of ourselves as infinite. The image of God is so impressed by him upon us, that we "conceive that resemblance wherein the idea of God is contained by the same faculty wherein we are conscious of ourselves." In other words, our consciousness of ourselves is an idea of God contained in the same faculty wherein we are conscious of ourselves, and of a unity in which both self and not-self are included. Our individual life is therefore to us as self-conscious beings a part of a wider universal life. Doubt and aspirations are but the manifestations of our will as individuals striving for the realization of that which, as conscious of itself, is at the same time conscious of the whole in which it is a part. And as the existence of a self and its consciousness are one, so we may say that a thinking being is not only a member of the universe, but also in some sense is united with that universal unity of being to which it is essentially related.

If Descartes had followed out this line of thought, he would have been led at once to the pantheism of Spinoza, if not beyond it. As it is, he is on the verge of contradiction with himself when he speaks of the consciousness of God as in some sense prior to the consciousness of self. How can anything be prior to the first principle of knowledge? It is no answer to say that the consciousness of self is prior to the consciousness of God. Descartes himself — and this is his understanding of primum cogitandi. For, if the idea of God is prior to the idea of self, knowledge must begin where existence begins, with God. The words "in some sense," with which Descartes qualifies his assertion, do not alter the fact that his whole philosophy is based on a partial consciousness of the contradiction in which he is involved. Some of Descartes' critics presented this difficulty to him in another form, and accused him of reasoning in a circle when he said that he had come back to the statement that he could not belong to a clear and distinct idea.

The very existence of the conscious self, the cogito, ergo sum, which is the first of all truths and therefore prior in certitude to the existence of God, is believed only because of the assertion of the final cause from which it follows. How then, they argued, could God's truthfulness be secured for a principle which we must use in order to prove the being of God? The answer of Descartes is somewhat lame. We cannot doubt any self-evident principle as a principle on a priori argument, when we are directly contemplating it in the necessity of its existence; it is only when we forget or turn away from this evidence, and begin to think of the possibility of a deceiver, God, that a doubt arises which cannot be removed except by the consciousness that God is true. It can scarcely be said that this is a dignum vindice ad eunus, or that God can fitly appear as a second-best resource to the great spirit that has lost its direct hold on truth and its faith in itself. God, truth, and the spiritual relation among ideas and accidental relations with each other. What Descartes, however, is really expressing in this exoteric way is simply that beneath and beyond all particular truths lies the great general truth of the unity of thought and soul, which so completely dominates the human mind and will not consciously relate to this unity, but when we have to defend ourselves against scepticism we are forced to realize this relation.

The ultimate answer to any attack upon a special aspect or element of truth might not be to assert that of truth itself, the very possibility of knowledge, is involved in the rejection of it, and that we cannot doubt it without doubting reason itself. But to doubt reason is, in the language of Descartes, to doubt the truthfulness of God, for, in his view, the idea of God is involved in the constitution of reason. Taken in this way, the import of Descartes' answer is, that the consciousness of self, like every other particular truth, is not at first seen to rest on the consciousness of God, but that in the very process of our self-consciousness it is clearly seen to have a relation to the idea of God, and that this relation is not self-conscious, but is that which consciousness of self is identical with the consciousness of God.

Descartes, however, is far from a clear apprehension of the ultimate unity of thought and being, which nevertheless he strives to find in God, a unity which also involves the res extensa, he is continually falling back into dualism just when he seemed to have escaped from it. Even in God the absolute unity, idea and reality fall asunder; our idea of God is not God himself, but a gun. But this idea of God is not inconsistent with the view that the idea of God is not God himself, but a gun. But the category of causality, if it forms a bridge between different things, as here between knowing and being, at the same time repels them from each other. It is a category of external relation which may be accepted to express the relation of the finite to the infinite, but not the relation of the infinite to the finite. We cannot conceive God as the cause of our idea of him, without making God a purely objective and therefore finite existence. Nor is it the better way when we turn to the so-called ontological argument,—that existence is necessarily involved in the idea of God, just as the property of having its angles equal to two right angles is involved in the idea of triangle. This view transcends the distinction between itself and existence, and that therefore existence cannot be a thing in itself out of thought, but must be an intelligible world that exists as such only for the thinking and understanding. We cannot find in Descartes, or to find it we must make him inconsistent with himself. He was far from having quelled the phantom thing in itself, "that he treated matter in space as such a thing, and that it is no contradiction to say that a body is at one place, while it is at another. But the link that shall bind thought to existence is still wanting, and, in consistency with the other presuppositions of Descartes, it cannot be supplied.

But again, even if we allow to Descartes that God is the unity of thought and being, we must still ask what kind of unity? Is it a mere generic unity, reached by abstraction, and therefore leaving out all the distinguishing characteristics of the particulars under it? Or is it a concrete unity to which the particular elements are subordinated, but in which they are nevertheless included? To answer this question, we need only look at the relation of the finite to the infinite, as it is expressed in that passage already quoted, and in which we find the following: "The idea of the infinite is in the ultimate essence of things, but the finite is merely an affirmative or positive existence, and of the finite in so far as it is distinguished from the infinite, as purely negative, or in other words as a nonentity. "I am," he says, "a mean between God and myself. I am a true body, but not a true geometrical body, as I am made by God, there is nothing in me that can deceive me or lead me into error. But on the other hand, if I consider myself as participating in nothingness or not-being, inasmuch as I am not the true geometrical body, being, in many ways different from myself, I am exposed to an infinity of errors. Thus error as such is not something real that depends on God, but simply a defect: I do not need to explain it by means of any special faculty bestowed on me by God, but simply by means of the defect which I bring with me from my being, or by the error with which he has endowed me, is not infinite." But if we follow out this principle to its logical result, we must say not only that error is a consequence of finitude, but also that the very existence of the finite is a condition, according to the well-known Spinozistic aphorism, is negation, and negation cannot constitute reality. To know the reality of things, therefore, we have to abstract from their limits, or in other words, the only reality is the infinite. Finite being, qua finite, has no existence, and finite self-consciousness, consciousness of a self in opposition to or limited by a not-self, is an illusion. But Descartes does not thus reason. He does not see "anything in the nature of a distinction of the finite and the infinite". "What," he asks, "would become of the power of that imaginary infinite if it could create nothing? Perceiving in ourselves the power of thinking, we can easily conceive that there should be a greater intelligence of all things which is greater than that intelligence which increased ad infinitum, we need not fear that our own would be lessened. And the same is true of all other attributes which we ascribe to God, even of his power, provided only that we may suppose that God, as subject to God's will. In all points, therefore, he is infinite without any exclusion of created things."

The truth of this view we need not dispute; the question is as to its consistency with Cartesian principles. It may be a higher idea of God to conceive him as revealing himself in and to finite things, but it is a different idea from which is implied in Descartes' explanation of error. It is an inconsistency that brings Descartes nearer to Christianity, and nearer, it may also be said, to a true metaphysic; but it is not the less an inconsistency with the Cartesian principle. For Descartes supposed that the idea of intelligence increased ad infinitum, we need not fear that our own would be lessened. And the same is true of all other attributes which we ascribe to God, even of his power, provided only that we may suppose that God, as subject to God's will. In all points, therefore, he is infinite without any exclusion of created things."

Mind and matter.

Mind and matter.
mind is an indivisible unity. In fact, though of this Descartes is not conscious, the determination of the one is mediated by its opposition to the other; the ideas of object and subject, the self and not-self, arc terms of a relation distinguishable but inseparable. But the self is not the subject, and the subject must be distinguished from the object rather in one way or another, whether by combining the two under a higher notion, or, as it would be more natural to expect on Cartesian principles, by abstracting equally from the particular characteristics of both. Descartes indeed nowhere acts partly on the one principle and partly on the other. In his idea of God he abstracts from the properties of matter but not from those of mind. "God," he says, "contains in himself formaliter all that is of kind and matter. In particular and as such, he contains in himself the ground of all the things for which reason, elsewhere expresses it more popularly, he is mind, but he is only the creator of matter. And for this he gives as his reason, that matter as being divisible and passive is essentially imperfect. Ipsa natura corporis multas imperfectiones imintel, and, therefore, "there is no difference between, nor, as it were, nothing for themselves, between the divine things and God." But the real imperfection here lies in the abstractness of the Cartesian conception of matter as merely extended, merely passive; and this is balanced by the equal abstractness of the matter of mind. Descartes attaches with so little simplicity, a pure intelligence without any object but itself. If matter as absolutely opposed to mind is imperfect, mind as absolutely opposed to matter is equally imperfect. In fact they are the two opposite sides of the same unity, and we are thrown for ourselves between each other, and if we are to seek this unity by abstraction, we must equally abstract from both.

The result of this one-sidedness is seen in the fact that Descartes, who begins with an idea of the matter and the matter of mind, ends by finding the essence of mind in pure will, i.e. in pure formal self-determination. Hence God's will is conceived as absolutely arbitrary, not determined by any end or law, for all laws, even the laws of thought between, nor, and were, then for ourselves between each other, and if we are to seek this unity by abstraction, we must equally abstract from both.

Rem. 3. 417.

In order to persevere a mechanism.

Material truths...
These views of the nature of sensation, however, at once force us to ask how Descartes can consistently admit that a subjective result of sensation, such as sensation, a result in mind, should be produced by an object of which the subject is not capable. The difficulty reaches its height when Descartes attempts to explain the union of the body and spirit in man. Between two substances which, when clearly and distinctly conceived, have nothing in common, how can we think that they are capable of union, unity,—a union of composition that still leaves them external to each other. Even God cannot make them one in any higher sense. As and it is impossible in the nature of mind to see any idea of the external world, the animal spirits, to see any reason why it should become the organ of the mind, the union of the two must be taken as a mere empirical fact. When we put on the one side all that belongs to intelligence, and on the other all that belongs to matter, there is a residuum in our ideas which we cannot reduce to either of these extremes. This residuum is our passions, our sensations, including not only the feelings of pain and pleasure, but also the perceptions of color, smell, taste, of hardness and softness, and all the other qualities apprehended by touch. To the last two of these, the senses and the passions, we give the name of sensations. These are the subjective feelings caused by external objects or other human beings, which, in their nature and extent, as to the parts, and the manner and method of their production, differ from each other.
do not wonder even when we find him treating as a "miserable" the philosopher who tore away the veil. Malebranche saw "all things in God." In other words, he taught that knowledge is possible only in so far as thought is the expression, not of the nature of the individual subject as such, but of a universal life in which he and all other rational beings partake. "No one can feel my individual pain; every one can see the truth which I contemplate—why is it so? The reason is that my pain is a modification of my substance, but truth is the common good of all spirits." This idea is ever present to Malebranche, and is repeated by him in an endless variety of forms of expression. Thus, like Descartes, but with more decision, he tells us that the idea of the infinite is prior to the idea of the finite. "We conceive of the infinite being by the very fact that we conceive of being without thinking whether it be finite or no. But in order that we may think of a finite being, we must necessarily cut off or deduct something from the general notion of being, which consequently we must necessarily lose possession. Thus the mind does not apprehend anything whatever, except in and through the idea that it has of the infinite; and so far it is from being the case that this idea is formed by the confused assemblage of all the ideas of particular things as the philosophers maintain, that, on the contrary, all these particular ideas are only participations in the general idea of the infinite, just as God does not derive his being from the creatures, but all the creatures are imperfect participations of the divine Being." Again, he tells us, in the same chapter, that "when we wish to think of any thing particular, we first cast our view upon all being, and then apply it to the consideration of the object in question. We could not desire to see any particular object unless we saw it already in a confused and general way, and as there is nothing which we do not desire to see, so all objects must be in a manner present to our spirit. Or, as he puts it in another place, "our mind would not be capable of representing to itself the idea of those beings and species if it did not see all things as contained in one; for every creature being an individual we cannot say that we are apprehending any created thing when we think the general idea of a triangle."

The main idea that is expressed in all these different ways is simply this, that to determine any individual object as such, we must relate it to, and distinguish it from, the whole of which it is a part; and that, therefore, thought could never apprehend anything if it did not bring with itself the idea of the infinite of which it is a part. Malebranche had already expressed this truth in his Meditations, but he had deprived it of its full significance by making a distinction between the being and the idea of God, the first being the idea in itself, the second the idea in us. Malebranche detects this error, and denies that there is any idea of the infinite, which is a somewhat crude way of saying that there is no division between the idea of the infinite and its reality. What Reid asserted of the external world, that it is not represented by an idea in our minds, but is actually present to them, Malebranche ascribed of God. No individual thing, he tells us—and an idea is but an individual thing—could represent the infinite. On the contrary, all individual things are represented through the infinite Being, who contains them all in his substance "très efficace, par conséquence très intelligible." We know God by himself, material things only by their ideas in God, for they are "unintelligible in themselves, and incapable of being comprehended in any other manner. And thus, unless we in some way "saw God, we should be able to see nothing else." The vision of God or in God, therefore, is an "intellectual intuition" in which sense all knowledge is unity and knowledge of our knowledge is our participation in God's knowledge of all.

When we have gone so far with Malebranche, we are tempted to ask why he does not follow out his thought to its natural conclusion. If man's knowledge is adequate to his consciousness of it, the idea of him that all things are known, and through his existence that all things are, then it would seem necessarily to follow that our consciousness of God is but a part of God's consciousness of himself, the consciousness both of the soul and of God's consciousness of him, and lastly, that there is no existence either of ourselves or other things except in this consciousness. To understand Malebranche is mainly to understand how he stopped short of results that seemed to him so directly in the line of his thought.

To begin with the last point, it is easy to see that Malebranche only asserts unity of idea and reality in God, to deny it everywhere else, which with him is equivalent to asserting it in general and denying it in particular. To him, as to Descartes, the opposition between mind and matter is absolute. Material things cannot come into our minds nor can our minds go out of themselves 1 for se propriétes les uns les autres, which could not of course be the case.

Thus, the idea of God's infinite is prior to the idea of his existence, and the manner of his existence in God, is explained by a mere act of His will, that is, it is not explained at all. Though we see all things in God, therefore, there is no connexion between his existence and theirs. The idea of God is not a necessary emanation of divinity: God is perfectly self-sufficient, and the idea of the infinitely perfect being can be conceived quite apart from any other. The existence of the creatures is due to the free decrees of God. Malebranche, therefore, still believes in an external world. Nevertheless, we cannot help thinking that even in the conception of the world, though it is only in and through the divine thought they can be known by us. To see the material world, or rather to judge that it exists (since it is in itself incapable), it is necessary that God should reveal it to us, for we cannot see the result of his arbitrary will through necessary reason.

But if we know external things, one through their idea in God, how do we know ourselves? Is it also through the idea of us in God? Here we come upon a point in which Malebranche diverges very far from his master. We do not, he says, properly know ourselves at all as we know God or even external objects. We are capable of self-knowledge, but only of so much as we choose to know; thus, we do not know what we are. We know the existence of our soul more distinctly than of our body, but we have not so perfect a knowledge of our soul as of our body. This knowledge is not a knowledge of a self-sufficient substance, we can at once see what are its possible modifications. In other words, we only need the idea of extended substance to see that there is an inexhaustible number of figures and motions of this substance; but the idea of self as a self-sufficient idea is not given already in the conception of extension. But it is not so with our consciousness of self, which does not enable us to say prior to actual experience what sensations or passions we are in. We know no more of the actual than of the inactual. Our knowledge of ourselves is a knowledge of a self-sufficient substance, we cannot escape from it that it is possible of immediate consciousness.

We know by feeling that our soul is great, but perhaps we know almost nothing of what it is in itself. The informations of sense have, as Descartes taught, only a practical but no theoretical value; they tell us nothing of the external world, the real nature of which we know not through touch and taste and sight, but only through our idea of extended substances; while the nature of our soul we do not even know the idea of. We know it is not material. And in this latter case we have no idea, nothing better than sense to raise us above its illusions. It is clear from these statements that by self-consciousness Malebranche means consciousness of his own distinctness as an individual as such, and not consciousness of self as thinking. He begins, in fact, where Descartes ended, and identifies the consciousness of self as thinking, and so transcending the limits of its own particular being, with the consciousness of the infinite in thought, the unity in thought, the consciousness of infinite in thought, or in other words, between the consciousness of the universe and the consciousness of the individual, he sees no connexion. Malebranche is just one step removed from the Pantheism of Spinoza, who identifies the consciousness of finite individuality as spirit with mind, and that as all bodies are but modes of one infinite extension, so all souls are but modes of one infinite thought. But while he willingly accepted this identification of religious feelings with reason, from accepting it in relation to mind, he was therefore, to the inconsistency of holding that sense and feeling, which in his view we apprehend the finite as such, give us true though imperfect knowledge of the soul, while the knowledge of body is not only imperfect but false. Thus the finite spirit is still allowed to be a substance, distinct from the infinite, though it holds its substantial existence on a precarious tenure. It is left hanging, we may say, on the verge of the infinite, whose actual existence is beyond the power of human knowledge, and often remold the minds that admit them in spite of the greatest resistance of dead custom and traditionary belief. In the grasp of a logic that overpowers him the more easily in that he is unconscious of its action, but once the Pantheistic conclusion, and all his Christian feeling and priestly training can do is just to save him from denial of the personality of man.

But even this denial is not the last word of pantheism. When the principle that the finite is known only in relation to the universal, is interpreted as

2 Malebranche, i. 2, § 5. Entretien, i. § 5.

meaning that the infinite and universal is complete in itself without the finite and individual, when the finite and individual is created as a mere accidental existence due to the "arbitrary will of God," it ceases to be possible to conceive even God as a spirit. Did Malebranche realize this when he was saying that he believed in an arbitrary will not particular any being? At any rate we can see that the same logic that leads him almost to deny the reality of finite beings, leads him also to seek the divine nature in something more abstract and general than the finite and individual, in order to know God as he is, is it not necessary for us also to abstract from self-consciousness, for self-consciousness has a negative element in it that is something definite, and therefore limited? We do not wonder, therefore, when we find Malebranche saying that "in order to know God as he is, he is not material, but only that he is an infinitely perfect being, and that he must be conceived as a spirit and not as a body simply because spirit is more perfect than body." When we call God a spirit, it is not because he has any properties of matter without being material, so he comprehends in himself the perfections of created spirits without being a spirit as we alone can conceive spirits, and that his true nature is he who is, he who always is, the absolute, the infinite. Thus the essentially self-revealing God of Christianity gives way to a pure spirit, and pure spirit in its turn to the eternal and incomprehensible substance of which we can say nothing but that it is the divine substance and hence that it contains eminently some incomprehensible form that is reconcilable with its infinitude. But we have no adequate name by which to call it except Being. The curious metaphysical theorey by which, in order to preserve the deistic view of God, he introduces the idea of absolute and perfect in one Being, by the supposition that the finite creation, as finite is unworthy of God, was made worthy of union with Christ, the divine Word; shows that Malebranche had some instinctive sense of the necessity of reconciling the divine with the natural in the same way that Descartes was, in order to save the absoluteness of the natural. The result of the union of such incongruous elements was something which the theologians at once recognized as heterodox and the philosophers as illogical.

Reason and will. Thus the conscious existence of such a Being which brought him into trouble with the theologians, and which was the main subject of his long controversy with Arnauld. This was his denial of particular providence. As Leibnitz maintained that this is the best of all possible worlds, and that it shows also the necessity of all individual and particular evil consequences, though their ultimate result is the highest good. The question why there should be any particular existence, any existence but God, seeing such existence necessarily involves evil, was at a time more urgently set at issue by the pantheistic view of God is maintained; and it is this view which is really at the bottom of the assertion that he can have no particular volitions. To the coarse and anthropomorphic conception of parents and makers, of all the individual things, this objection is valid; but on the other hand, it cannot be doubted that any theory in which the universal is absolutely opposed to the particular, the infinite to the finite, is unchristian as well as unphilosophical. For under this dualistic presupposition he thought: either the particular and finite must be treated as something independent of the universal and infinite, which involves an obvious contradiction, or else it must be regarded as absolute nothingness. We have seen the ultimate essence of mind lay in pure abstract self-determination or will, and hence he based even moral and in-}

The general result of the ethics of Malebranche is ascetic. The
passions, like the senses, have no relation to the higher life of the soul; their value is only in relation to the union of soul and body, a union which is purely accidental or due to the arbitrary will of God. The more silently they discharge their provisional function, and the less they disturb or interfere with the pure activity of spirit, the more nearly they approach to the only perfection that is possible for them. Their ideal state is to remain or become again simple instincts that act mechanically like the circulation of the blood. Under these circumstances, love is the most elevated passion of the human heart, its universal love cannot embrace any of the objects of particular passion. It is indeed recognized by Malebranche that sensation in man is mixed with thought, that the passions in him are forms of the love of good in general. But this union of the rational with the sensuous is not merely a containment, but the withdrawal of the spirit from contact with that which darkens and defiles it. Of a transformation of sense into thought, of passion into divinity, of the life of sense till it becomes the embodiment and expression of the life of reason—Malebranche has no conception. Hence the life of reason turns with him to mysticism in theory and to asceticism in practice. His universal is abstract and opposed to the particular; instead of explaining it, it explains away.

A certain tender beauty as of twilight is spread over the world as we view it through the eyes of this dianoctered philosopher, and we do not at first see that the softness and ideality of the picture is due to the gathering darkness. Abstraction seems only to be purifying, and not destroying, till it has done its perfect work. Malebranche conceived himself to be presenting to the world only the purest and most refined expression of Christian ethics and theology. But if so, he did not think of the world as it really is, as tenderly, as if we divest his system of all the sensuous and imaginative forms in which it has clothed, and reduce it to the naked simplicity of its central thought, what we find is not a God that reveals himself in human experience, and in this simple way alone is true to the supposition that reason can derive no revelation, and whose existence is the negation of all but itself. Thus to tear away the veil, however, there was needed a stronger, simpler, and freer spirit—a spirit less influenced by opinion, less inclined to practical philosophy and charity, and less gifted with a stronger faith in the whispers of the lonely muse of speculation than Malebranche.

The Philosophy of Spinoza.—It is a remark of Hegel’s that Spinoza, as a Jew, first brought into Europe the thought of Pythagoras and Plato, and that the difference of antiquity and modernity is lost. While some writers have gone further, and attempted to show that the main doctrines by which his philosophy is distinguished from that of Descartes were due to the direct influences of Jewish writers like Maimonides, Gerontides, and Hasdai Crescas, rather than to the necessary development of Cartesian ideas. And it is undoubtedly true that many points of similarity with such writers, reaching down even to verbal coincidence, may be detected in the works of Spinoza, though it is not so easy to determine how much he owed to their teaching. His own view of his obligations is sufficiently indicated by the fact, that while in his ethics he carries on a continual polemic against Descartes, and strives at every point to show that his own doctrines are legitimately derived from Cartesian principles, he only once refers to Jewish philosophy as containing an obscure and unreasoned anticipation of these doctrines. "Quod quidam Hebraeorum quasi per nebulem vidisse visitur qui scilicet statuum Dei intellectus resque ab ipso intellectus unum et idem esse. It may be that the undeveloped pantheism and monotheism of modern Jewish philosophers had a deeper influence than he himself was aware of, in the dissemination of the traditions of the synagogue, and giving to his mind its first philosophical bias. In his earlier work there are Neoplatonic ideas and expressions which in the Ethics are rejected or remodelled into a form more suitable to the spirit of Cartesianism. But the question, after all, has little more than a biographical interest. In the Spinozistic philosophy there are few differences from Descartes which cannot be traced to the necessary development of Cartesian principles; and the comparison of Malebranche shows that a similar development might take place under the most diverse intellectual conditions. What is most remarkable in Spinoza is just the freedom and security with which these principles are followed out to their last result. His Jewish origin and his breach with Judaism completely isolated him from every influence but that of the thought that possesses him. And no scruple or hesitation, no respect for the institutions or feelings of his time interferes with his speculative consequences. He exhibits to us the almost perfect type of a mind without superstitions, which has freed itself from all but reasoned and intelligent convictions, or, in the Cartesian words, the "clear and distinct ideas"; and when he fails, it is not by any inconsistency, or arbitrary stopping short of the necessary conclusions of his logic, but by the essential defect of his principles.

Spinoza takes his idea of method from mathematics, and after the manner of Euclid, places at the head of each book of his Ethics the definitions, postulates, and common notions which are supposed to be intuitively certain, and to form a sufficient basis for all that follows. Altogether there are twenty-seven definitions, twenty axioms, and eight common notions. If, however, we look for some final cause, that is, some relation to ourselves by which they may be explained. For this reason, he says, "the truth might ever have remained hid from the human race, if, mathematics, had not led to the final cause of figures, but to their essential nature and the properties involved in it, had not set another type of knowledge before them." To understand things is to see how all that is true of them flows from the clear and distinct idea expressed in the definitions and axioms, how it flows from the "essentia Dei" as all geometrical truth flows from the idea of quantity. To take a mathematical view of the universe, therefore, is to raise ourselves above all consideration of the end or tendency of things, and to look at the universe only as a form of quantity. Mathematics shows us the inadequacy of such knowledge when we take it out of itself, and when it is reduced to the standard for measure; or the universe as a thing not under the form of the finite and temporal, but sub quantum specie adeimatis.

The illusion of the finite—the illusion of sense, imagination and passion, which, Bacon’s language, tensely illustrated of things ex analogia hominis et non ex analogia universi, which raises the individual life, and even the present moment of the individual life, with its passing feelings, into the highest light of things, into the eyes of Spinoza, is the source of all error and evil to man. On the other hand, his highest good is to live the universal life of reason, or what is the same thing, to view all things from
their centre in God, and to be moved only by the passion for good in general, "the intellectual love of God." In the treatise De Espinasto, Enitels, Spinoza takes up this contrast in the first instance from its moral side. All our felicity or infelicity is founded on the nature of the object to which we are joined by love and hate, or by things that perish is to be in continual trouble and disturbance of passion; it is to be full of envy and hatred towards others who possess them; it is to be ever striving after that which, when we attain it, we lose; or, in short, it is united to us, with which inevitably passes away from us; only "love to an object that is infinite and eternal feeds the soul with a changeless and unmingled joy." But again our love rests upon our knowledge; if the objects as they really are we should love only the highest object. It is because reason and imagination give to us an independence and substantiality that do not belong to it, that we waste our love upon it as if it were infinite. And as the first step towards truth is to understand our error, so Spinoza proceeds to explain the principal error of our common sense and the unreflected view of the world which he, like Plato, calls opinion. Opinion is a kind of knowledge derived partly from hearsay, and partly from expressio nis. It consists of vague and general conception of things, and so it gets us the report of an independent experience which has not received any special direction from intelligence. The mind that has not got beyond the stage of opinion takes things as they present themselves in its individual experience; and its belief of what can be known is what happens to it has been found together in that experience. And as the combining principle of the elements of opinion is individual and not universal, so its conception of the world is at once fragmentary and accidental. It is a mere union of various elements, and thus, as it is a mere order of nature, i.e. so long as it is externally determined to contemplate this or that object by the accidental concourse of things, and so it is not internally determined by the unity of truth in which it is a part of number of things to understand their agreements, differences and contradictions."

There are two kinds of errors which are usually supposed to exclude each other, but which Spinoza finds to be united in opinion. These are the errors of abstraction and imagination; these are the errors of abstraction and imagination, and in which things are treated as if they were res complicate, individual objects, concepts of which are united by association, and in which the commonness of things is often the victim of abstractions when it supposes itself most of all to be dealing with realities. The essences of the schoolman may delude him, but he cannot think these notions clearly and distinctly. Spinoza, in the second place, says that they have a meaning only in relation to the other elements of it. But common sense remains unconscious of its abstraction because imagination gives a kind of distinctness to the fragmentary and unconnected, and so it gets us the report of an independent experience. Pure intelligence seeing the part as it is in itself could never see it but as a part. Thought, when it rises to clearness and distinctness in regard to any finite object, must at once discern its relation to others. And even the very word is a common word that "modal" and "not real." But though it is not possible to think the part as a whole it is possible to picture it as a whole. The limited image that fills the mind's eye seems to need nothing else for its reality. We cannot think a house clearly and distinctly, and in which the commonness of a house is a house, and that they have a meaning only in relation to the other elements of it. But common sense remains unconscious of its abstraction because imagination gives a kind of distinctness to the fragmentary and unconnected, and so it gets us the report of an independent reality. Pure intelligence seeing the part as it is in itself could never see it but as a part. Thought, when it rises to clearness and distinctness in regard to any finite object, must at once discern its relation to others. And even the very word is a common word that "modal" and "not real." But though it is not possible to think the part as a whole it is possible to picture it as a whole. The limited image that fills the mind's eye seems to need nothing else for its reality. We cannot think a house clearly and distinctly, and in which the commonness of a house is a house, and that they have a meaning only in relation to the other elements of it. But common sense remains unconscious of its abstraction because imagination gives a kind of distinctness to the fragmentary and unconnected, and so it gets us the report of an independent reality.

**Vices of abstraction and imagination.**

On the other hand, as knowledge advances, this freedom of combination becomes limited, "the less the mind understands and the more it perceives the greater is its power of fiction, and the more it understands the narrower is the limitation of that power. For just as the possession of common sense can never imagine that we do not think, so after we have apprehended and seen how far we can conceive of a fly of infinite size, and after we know the nature of a soul we cannot think of it as a square, though we may use the word 'square' to express our ideas." Thus, according to Spinoza, the range of possibility is limited by the more evident, until to perfected knowledge possibility is lost in necessity.

From these considerations it follows that all thought is imperfect that stops short of the absolute unity of all things. Our first imperfect conception of things is isolated and disconnected connected only by co-existence and succession, is a mere imagination of things. It is a fictitious substantiation of isolated moments in the eternal Being. Knowledge, so far as it is immediately related to us, is only the process of self-correction which can never be completed, for at every step there is an element of falsity, in so far as the mind rests in the contemplation of a certain number of the elements of the world, as Spinoza says, "of the whole whose parts are only a part, the conception of which has to be modified at the next step of considering its relation to the other parts. Thus we rise from individuals of the first to individuals of the second order, and we cannot stop short of the idea of 'all nature as one individual whose parts vary through an infinite number of modes, without change of the whole individual.' At first we think of pieces of matter as independent individuals, either because we can picture them as separate, or because we cannot see the relation of parts through their changes. But on further consideration, these apparent substances sink into modes, each of which is dependent on all the others. All nature is bound together by necessity, and the idea of nature as a whole remains untouched by the change through all. His mind is a link in a great movement of thought, which makes him the momentary organ and expression of one of its phases. His very consciousness of self is marred by a false abstraction, above which he must rise ere he can know himself as he really is.

"Let us imagine," says Spinoza, in his fifteenth letter, "a little worm living in blood which has vision enough to discern the particles of blood, and to this end. This worm, which is never alone, is repelled by another with which it comes into contact, or communicates a part of its motion to it. Such a worm would live in the blood as we do in this part of the universe, and would regard each particle of the blood as a whole, and not as a part of a whole. and all the parts are influenced by the universal nature of the blood, and are obliged to accommodate themselves to each other as is required by that nature, so that they co-operate together according to a fixed law. For if we suppose that the whole uses itself, by which could communicate new motions to it, and no space beyond the blood, nor any other bodies to which its particles could transfer their motion, it is certain that the blood as a whole would always maintain the same situation. But even this is not sufficient, other variations than those which may be inferred from the given relation of the motion of the blood to lymph, chyle, &c. And thus in that ease the blood would require to be considered always as a whole and not as a part. But since there are many other causes which influence the laws of the nature of the blood, it is evident that other motions and other variations must arise in the blood which are not due to the proportion of motion in its constituents but also to the relation between that motion and external causes. And therefore the blood must be considered as a whole, but only as a part of a greater whole."
with its infinite powers, the parts are modified in an infinite number of ways, and compelled to pass through an infinite of variations. Moreover, when I think of the universe as a substance, I conceive of a still closer union of each part with the whole; for, as I have said, the idea of the whole belongs to every part, so that every single part belongs to the nature of the corporeal substance, so that apart therefrom it neither can exist nor be conceived. And as to the human mind, I think of it also as of part of nature, for I think of nature as having in it an infinite power of things, that is, as consisting of all nature, and whose thoughts run parallel with all existence.

From this point of view it is obvious that our knowledge of things cannot be real and adequate, except in so far as it is determined by the knowledge of the whole and by the nature of the parts. A knowledge that proceeds from parts to part must always be imperfect; it must remain external to its object, it must deal in abstractions or mere entia rationis, which are the little fractions on which they have been built up, the substantive of all knowledge of things." The latter alone deserves to be called science in the highest sense of the term. "For in order that our mind may correspond to the exemplar of nature, it must develop all its ideas from the idea that represents the origin and source of nature and from nothing else; it must develop all its ideas." The regressive mode of knowledge has its highest value in preparing for the progressive. The knowledge of the finite, ere it can become perfectly adequate, must be absorbed and lost in the knowledge of the infinite.

In a remarkable passage in the Ethics, Spinoza declares that the defect of the common consciousness of men lies not so much in their ignorance, either of the infinite or of the finite, as in their misunderstanding of the idea of the infinite. "It is by the idea of the infinite that we must determine what is divine and what is human, and hence they treat created things as if they were substances, that is, as if they were Gods. "Thus while they are contemplating finite things, they think of nothing less than of the divine nature; and, when they turn to consider the divine nature, they think of nothing less than of the finite. Thus we are brought up, or rather, we are ourselves brought up, to the knowledge of the finite things, as if these things could contribute nothing to our understanding of the divine nature. Hence it is not wonderful that they are always contradicting themselves." As Spinoza himself declares, we are all human beings with a finite mind to know God, for unless we know God we could know nothing else. The idea of the absolute unity is involved in the idea of every particular thing, yet the generality of men, deluded by sense and imagination, are led in their understanding of these things by self-interest, and hence their knowledge of God does not modify their view of the finite. It is the business of philosophy to correct this defect, to transform our conceptions of the finite by relating it to the infinity of the infinite, to discover the legends from which they had been derived, and to bring our ideas into connexion with the idea of the whole. The vital question which Spinoza himself prompts us to ask is how far and in what way this transformation is effected in the Spinozistic philosophy.

The finite is subject to the transformation of knowledge by the idea of unity as that idea is conceived by Spinoza. The first step involves a change of the conception of individual finite things by which they lose their individuality, their character as independent substances, and come to be regarded as modes of the infinite. But secondly, this negation of the finite as such is not conceived as implying the negation of the distinction between mind and matter. Mind and matter still retain that absolute opposition which they had previously, and without which the idea of the infinite would be impossible. And therefore in order to reach the absolute unity, and transcend the Cartesian dualism, a second step is necessary, by which the individual substantiality of mind and matter is withdrawn. And we see that the finite presupposes the infinite, and, indeed, so far as it is real, it is identical with the infinite.

The infinite is absolute reality, because it is pure affirmation, because it has no relation to anything else, because it is distinguished from it simply by its limit, i.e. by its wanting something which the infinite has. At this point Spinoza takes up the argument. If the infinite be the real, and the finite, so far as it is distinguished therefrom, the unreal, then the supposed substantiality or individuality of finite beings is an illusion. In itself the finite is an abstraction, to which imagination has given an apparent independence. All limitation or determination is negative, and in order to apprehend positive reality we must abstract from limits. By the negative, we reach the affirmative; by annihilating finitude in our thought, and so undoing the illusory work of the imagination, we are able to think of the infinite which alone is true. All division, distinction and relation are but entia rationis. Imagination and abstraction can give to them, as they can give to mere negation and nothingness, "a local habitation and name" so to say, but the highest knowledge, in the scientia intuitiva, which deals only with reality, they must entirely disappear. Hence to reach the truth as to matter, we must free ourselves from all such ideas as figure or number, measure or time, which imply the separation and relation of parts. This, Spinoza says, "to prove that figure is negation, and not anything positive, we need only consider that the whole of matter conceived indefinitely, or in its infinity, can have no figure; but that figure has necessarily to be in something other than itself, which in the figure he perceives, says only that he has before his mind a limited thing and the manner in which it is limited. But this limitation does not pertain to a thing in its esse, but contrariwise in its non-esse, it signifies, not that some positive quality belongs to the thing, but that something is wanting to it. Since, then, figure is but limitation, and limitation is but negation, we cannot say that figure is anything. The same kind of reasoning is elsewhere (Eth. ii. 129) applied to the concept of the divisibility of matter for extension. Really, according to Spinoza, extension is indivisible, thought modally it is divisible. In other words, parts ad infinitum may be taken in space by the abstracting mind, but these parts have no separate existence, individuality, or connexion with other parts. Hence arises the impossibility of asserting either that there is an infinite number of parts in space, or that there is not. The solution of the antimony is that neither alternative is true. There are not finite things "qua nullus numero explicari possunt," and we cannot understand these things we must abstract altogether from the idea of number. The contradiction arises entirely from the application of that idea to the infinite. We cannot say that space has a finite number of parts, for our abstracting mind can never be brought to the knowledge of any number, and must therefore say that a thing is included in infinite space. Yet, on the other hand, an infinite number is an absurdity; it is a number which is not a number. We escape the difficulty only when we see that number is a category applicable to the infinite, and this to Spinoza means that it is not applicable to reality, that it is merely an abstraction, or ens imaginatio.

The same method which solves the difficulties connected with the nature of matter is applied to mind. Here also we reach the reality, or thing in itself, by abstracting from all determination. Nature of mind.

All conceptions, therefore, that involve the independence of the finite, all conceptions of good, evil, freedom and responsibility disappear. When W. Blumenberg accuses Spinoza of making God an extension, he is quite right; and an abstracting mind has no existence, and an abstracting mind is that which has no existence.

The method by which the finite is reduced into a mode of the infinite has already been partially explained. Spinoza follows to its legitimate result the metaphysical or logical principles of the partaking of the infinite, which belong to the whole, and which therefore are real and necessary. As we have seen, the finite presupposes the infinite, and, indeed, so far as it is real, it is identical with the infinite. Thus the finite is an abstraction, to which imagination has given an apparent independence. All limitation or determination is negative, and in order to apprehend positive reality we must abstract from limits. By the negative, we reach the affirmative; by annihilating finitude in our thought, and so undoing the illusory work of the imagination, we are able to think of the infinite which alone is true. All division, distinction and relation are but entia rationis. Imagination and abstraction can give to them, as they can give to mere negation and nothingness, "a local habitation and name" so to say, but the highest knowledge, in the scientia intuitiva, which deals only with reality, they must entirely disappear. Hence to reach the truth as to matter, we must free ourselves from all such ideas as figure or number, measure or time, which imply the separation and relation of parts. This, Spinoza says, "to prove that figure is negation, and not anything positive, we need only consider that the whole of matter conceived indefinitely, or in its infinity, can have no figure; but that figure has necessarily to be in something other than itself, which in the figure he perceives, says only that he has before his mind a limited thing and the manner in which it is limited. But this limitation does not pertain to a thing in its esse, but contrariwise in its non-esse, it signifies, not that some positive quality belongs to the thing, but that something is wanting to it. Since, then, figure is but limitation, and limitation is but negation, we cannot say that figure is anything. The same kind of reasoning is elsewhere (Eth. ii. 129) applied to the concept of the divisibility of matter for extension. Really, according to Spinoza, extension is indivisible, thought modally it is divisible. In other words, parts ad infinitum may be taken in space by the abstracting mind, but these parts have no separate existence, individuality, or connexion with other parts. Hence arises the impossibility of asserting either that there is an infinite number of parts in space, or that there is not. The solution of the antimony is that neither alternative is true. There are not finite things "qua nullus numero explicari possunt," and we cannot understand these things we must abstract altogether from the idea of number. The contradiction arises entirely from the application of that idea to the infinite. We cannot say that space has a finite number of parts, for our abstracting mind can never be brought to the knowledge of any number, and must therefore say that a thing is included in infinite space. Yet, on the other hand, an infinite number is an absurdity; it is a number which is not a number. We escape the difficulty only when we see that number is a category applicable to the infinite, and this to Spinoza means that it is not applicable to reality, that it is merely an abstraction, or ens imaginatio.

The same method which solves the difficulties connected with the nature of matter is applied to mind. Here also we reach the reality, or thing in itself, by abstracting from all determination.

GARTESIANISM

So far as they exist, they must be conceived as parts of the divine substance, but when we look directly at that divine substance their separate existence altogether disappears.

It has, however, been already mentioned that this ascending movement of abstraction does not at once and directly bring Spinoza to the absolute unity of substance. The principle that "determination is negation," and that the absolute reality is to be found only in the indetermination of the parts, is the condition of the assertion that Cartesian dualism prevents Spinoza from reaching it. Mind and matter are absolutely opposed, that even when we take away all limit and determination from both, they still retain their distinctness. Raised to infinity, they still refuse to be identified. We cannot conceive a substance in which there is no other substance but God, who includes all reality in himself. But though reduced to attributes of a common substance, the difference of thought and extension is insusceptible of any determination when considered separately. We can determine, like the Absolute of the Buddhist, which we can characterize only by denying of it everything that we assert of the finite. In this view, no predicate can be applied univocally to God and to the attributes, but he differs from them, not only in existence, but in essence. If we follow out this view to its legitimate result, God is withdrawn into his own absolute unity, and no difference of attributes can be ascribed to him, except in respect of something else than himself. It is owing to the defects of our intelligence that he appears under different forms or expressions: a half-being, without form or expression at all. But, on the other hand, it is to be observed, that while Spinoza really proceeds by abstraction and negation, he does not mean to do so. The abstract is to him the idea of the infinite imagination, and is not simply Being in general, the conception that remains when we omit all that distinguishes the particulars, but the absolute totality of things conceived as a unity in which all particular existence is determined to the determination of the parts that absolute unity which is the presupposition of all thought and expression, and so to arrive at the most concrete and complete idea of the reality of things. He failed to see what is involved in his own principle that determination is negation; for if affirmation is impossible without negation, if the one implies not merely the other, but the attempt to find a purely affirmative being, must necessarily end in the barest of abstractions being confused with the unity of all things. But even when the infinite substance is defined as the determination of the finite, the absolute unity is the essential element in the conception of the infinite. Even the Pantheist, who says that God is what finite things are not, in spite of himself recognizes that God has a relation to finite things.

Finite things may in some degree be said to partake of the divine nature, but this is not in the sense of having any particular relation; it is through their evanescence and transitoriness, through their nothingness, that the eternal, the infinite reality alone is revealed to him. Spinoza is quite conscious of this process, conscious of the fact that the affirmation of substance by a negation of what he conceives as the purely negative and unreal existence of finite things, but as he regards the assertion of the finite as merely an illusion due to our imagination, so he regards the correction of this error as no correction of substance, but the correction of a thought which belongs merely to our intelligence, and has nothing to do with the nature of substance itself. We find the true affirmation by the negation of the negative, but in itself affirmation has no relation to negation. Hence his absolute being is the dead all-absorbing thing, without purpose or goal, which he himself reveals itself to be, and thus his metaphysics, though in the conception of mind and matter as well as in the conception of individual minds and bodies which is made by their reference to the idea of God, is that they lose their substantive character and become mere attributes.

While, however, Spinoza thus escapes some of the inconsequences of Descartes, the contradiction that was implicit in the Cartesian system, by the duality and the unity, the attributes and the substance, in his system becomes explicit. When so great emphasis is laid upon the unity of substance, it becomes more difficult to explain the difference of the attributes. The result is, that Spinoza is forced to account for it, not by the nature of substance itself, but by the nature of the intelligence to which it is revealed. "By substance," he says, "I understand that which is in itself, and is conceived through itself. By attribute I understand that which is in substance, but is not in substance itself, but in intellectus substantiae certum talem naturam triumbris." Hence we are naturally led with J. E. Erdmann to think of the intelligence dividing the substance as a kind of light that breaks the infinite light into different colors, and passes through each of which is a world only with a different aspect. But if the intelligence in itself is but a mode of one of the attributes, how can it be itself the source of their distinction?

To solve this difficulty is that Spinoza has really, and almost in spite of his logical principles, two opposite conceptions of substance, between which he alternates without ever bringing them to a unity. On the one hand, in accordance with the principle that determination is negation, he is led to conceive of mind and matter as two separate and unconnected substances, like the Absolute of the Buddhist, which we can characterize only by denying of it everything that we assert of the finite. In this view, no predicate can be applied univocally to God and to the attributes, but he differs from them, not only in existence, but in essence.
said of Spinoza’s negation of finite things. It was an external and imperfect negation, which did not transform the idea of the finite, but merely substituted the names of attributes and modes for the names of general and individual substances.

The same defective logic, by which the movement of thought in Descartes is regarded as altogether external to the substance itself, is seen again in Spinoza’s conceptions of the relations of the attributes to each other. Adopting the Cartesian opposition of mind and matter, he does not see, any more than Descartes, that they are correlated, and do not form by their union any complete whole. If Spinoza had seen that matter in itself is the correlative opposite of mind in itself, he need not have sought by abstracting from the difference of these elements in the reach of a virtue, which is manifested in himself, and his absolute would have been not substance but spirit. This idea he never reached, but we find him approaching to it in two ways. On the one hand, he condemns the Cartesian concept of matter—that it is a mere abstract in every sense of the term. In short, the mere opposite of thought. And sometimes he insists on the parallelism of extension and thought at the expense of their opposition in a way that almost anticipates the assertion by Leibnitz of the parallelism of mind and matter. And, on the other hand, he recognizes that this parallelism is not complete. Thought is not, it is true, a picture; it is conscious, and conscious not only of itself, but of extension. It transcends therefore the absolute distinction between thought and matter, which were the foundation of the idea of himself the phantom of an extended matter as a thing in itself, which is entirely different from the idea of it, that Spinoza is prevented from recognizing in mind that unity that transcends all distinctions, even with himself, the latter; but he completely escapes the reason for saying that intelligence is not an attribute of God, but merely a mode, seems to be this, that the thought of God must be conceived as producing its own object, i.e., as transcending the distinction of subject and object, whereas the Cartesian idea of thought is, as it were, converted into itself as it relates to the other objects of its own knowledge. But Spinoza’s idea relates to a concrete quite as much as to an abstract unity. It is as consistent with the idea of absolute spirit as with that of absolute substance. Spinoza’s deliberate and formal doctrine is undoubtedly the latter; but he constantly employs the notion of self-seeking in whatever he speaks of God as causa sui. The higher idea inspires him, though his consciousness only embraces the lower idea.

The ethical philosophy of Spinoza is determined by the same principles and by the same difficulties as his metaphysics. In it also we find the same imperfect conception of the relation of the positive to the negative elements, and, as a consequence, the same appearance of the absolute in a way that nearly anticipates the position of subject and object, which are distinguished and transcends all negations with mere abstract affirmation. Or, to put the same thing in ethical language, Spinoza teaches a morality which is in every point the opposite of the Cartesian idea of morality. On the one hand, there is no losing of life that we may find it. For the negative is nothing, it is evil in the one sense in which evil exists, and cannot come from the good. The higher affirmation of our own being, the higher seeking of ourselves which is identified with the love of God, must therefore be regarded as nothing distinct in kind from that first seeking of our natural self which in Spinoza’s view belongs to us in common with the animals, and indeed in common with all beings whatever. By the same token, the self-seeking which is the extension and expression of the same thing. The main interest of the Spinozistic ethics therefore lies in observing by what steps he accomplishes this transition, while excluding altogether the idea of a real division of the higher and lower affections and the idea of the development of the former through the sacrifice of the latter.

Finite creatures exist only as modes of the divine substance, only so far as they partake in the infinite, or what is the same thing with Spinoza, in the purely affirmative or self-affirming nature of God.

They therefore must also be self-affirming. They cannot in any limits exist; their limit lies in this, that they are not identified with the infinite substance which expresses itself also in other modes. In other words, the limit of any finite creature, that which makes it finite, is to be found, not in the negative element, but in the self-affirming element itself. It must be pure self-affirmation and self-seeking. "Unuaque res quantum in se est In suo esse perseverare conatur," and this conatus is its essence or inmost nature. In the animals this conatus takes the form of self-preservation, in us of self-affirmation and self-seeking.

He can neither know nor will anything but his own being, or if he knows or wills anything else, it must be something involved in his own being. If he knows other beings, or seeks their good, it must be because these are a part of his own. If he loves an act or knows God it must be because he cannot know himself without knowing God, or find his supreme good anywhere but in God.

What at first makes the language difficult to us is the identification of the two, intelligence. Both are represented as affirming their objects. Descartes had prepared the way for this when he treated the will as the faculty of judging or giving assent to certain combinations of ideas, and distinguished it from the purely intellectual faculty of knowing. The question is, therefore, that he had, as he supposed, secured a place for human freedom. Admitting that intelligence is under a law of necessity, he claimed for the will a certain latitude or liberty of indifference, a power of giving or withholding assent, as long as it is not an act of pure affirmation or negation, which is necessarily determined by necessity. All the actions of his will, as well as of his intelligence, are but different forms of the self-assertive tendency to which he cannot but yield, because it is one with his very being, or, only ideality in itself. The idea of liberty as the opposite of necessity is an absurdity—it is impossible for either God or man; but liberty as the opposite of slavery is possible, and it is actually possessed by God. The divine liberty is in possession of himself, and is the act of his own nature alone, and is not in any way determined from without.

And the great question of ethics is, How far can man partake in this liberty? At first it would seem impossible that he should partake in it. He is a finite being, whose power is infinitely surpassed by the power of other beings to which he is related. His body acts only as it is acted on, and his mind cannot therefore apprehend his body, except as affected by other things. His self-affirmation and self-seeking is thus made impossible. He can express no affirmation or negation, or anything else; how then can he know his own good or determine himself by the idea of it?

The answer is the answer of Descartes, that the apprehension of an idea of the self involves the idea of other things, and that the nature of the body. This is the primary object of intelligence, in which alone is grounded the possibility of knowing either ourselves or anything else. In so far as our knowledge is determined by this idea, or by the idea of other things, which are referred to to idea and the idea of its light, in so far its actions flows from an internal and not an external necessity. In so far, on the other hand, as we are determined by the affections of the body, ideas in which the nature of our own body and nature affections is involved together, we are determined by an external necessity. Or to put the same thing in what has been shown to be merely a way of expression, in so far as we are determined by pure intelligence we are free, but in so far as we are determined by opinion and impulse we are slaves. From these premises it is easy to see what form the opposition of reason and passion must necessarily take with Spinoza. The passions belong to our nature as finite; they are grounded on, or refer to, the idea of something else, and are determined by external causes. We are only in so far as our ideas either immediately are, or can be made, adequate. Our idea of God is adequate ex vi termini; our ideas of the affections of our body are inadequate, but can be made adequate by the act of faith. The same is true of the idea of God. As the idea of God is purely affirmative, this reference to the idea of God implies the elimination of the negative element from the ideas of the affections of the body, for nothing that is positive in a false idea is removed by the presence of truth as a fact. Brought into

contact with the idea of God, all ideas become true and adequate, by the removal of the negative or false element in them. The idea of God is, as it were, the touchstone which distinguishes the gold from the dross. It enables us to detect the higher spiritual element in the natural and mortal element; and so to sever the element belonging to a pure love of self which is identical with the love of perfection from the elements belonging to that impure love of our own finite individuality as much as is identical with the love of evil.

The recognition of this fact implies the perfection of all our faculties. It is in fact the same perfection which runs through his whole system. Just as he supposed that the ideas of finite things were at once made consistent with the idea of the infinite when he had named them in modes, so here his conception of the change through which selfish natural desire must pass in order to become spiritual is too superficial and external. Hence he has no sympathy with asceticism, or with the bent of the dissenters in the days of the Benthammem. The idea of asceticism, of 'total-tying,' is the 'transition from lower to greater perfection,' and cannot be but good; pain is the 'transition from greater to less perfection,' and cannot be but evil. The revolt against the medieval opposition of the spirit and the senses is visible in many of his sayings. No Deity who is not envious can delight in my weakness or hurts, or can regard as virtues those fears and sights and tears which are the signs of the mind's weakness; but contrariwise, the greater is our joy, the greater is our progress to perfection, and our participation in the divine nature.1 "A free man thinks of nothing less than death, his wisdom is a meditation not of death but of life." The same idea, combining with the idea of necessity, leads him to condemn the asceticism of the ancient church; and here, distinctly, Spinoza reproduces the principle of asceticism, while in words he utterly rejects it. For though he tells us that pure self-complacency is the highest thing we can hope, yet from this self-appropriation we have no right to conclude that the idea of eternity is eliminated. Qui Deum amat, conas non potest ut Deus ipsum contrac memet. In like manner, he absolutely condemns all hatred, envy, rivalry and ambition, as springing out of an over-estimate of the finite from which he, however, with the lessened life of God, is that which is enjoyed the more easily and fully the greater the number of participants. Yet Spinoza's exaltation of the social life, and of the love which binds it together, is too like the Buddhist's universal charitas. We have here the same idea of pure self-complacency as are based on a abstraction from all that is individual, only the Buddhist's abstraction goes a step further, and erases even the distinction between man and the animals. Spinoza felt the pressure of this all-living idea. And he says, "I confess I do not understand how the substance of the mind and soul expresses God more than the other creatures, for I know that between the finite and the infinite there is no proportion, and that the distinction between God and the most excellent of created things differs not a whit from the distinction between him and the lowest and meanest of them." As Pope said, God is "as full and perfect in a hair as a heart;" in all finite things there is a ray of divinity, and in nothing more than a ray. Yet in another epistle Spinoza comes to a very different conclusion. He declares that it is necessary to "know Christ after the flesh, he does think it is necessary to know the eternal Son of God, i.e. God's eternal wisdom, which is manifested in all things, but chiefly in the mind of man, and mostly of all, in Christ Jesus," and he adds that in man and in animals it is not so difficult to be met and known. Man and animals are treated as an absolute distinction, and it is asserted with doubtful consistency that the human soul cannot be destroyed along with the body, for that there is something of it which is eternal. Yet from this eternity we must, of course, eliminate a part of the consciousness of the finite self as such. At this point, in short, the two opposite streams of Spinoza's thought, the positive method he intended to pursue, and the negative or abstracting method he really does pursue, meet in inner conflict. The finite must be related to the infinite so as to preserve all that is in it of reality; and therefore its limit or the negative element in it must be abstracted from. But it turns out that this is not an easy task, and that the problem of the existence of the finite, the positive also appears, and God is all in all in a sense that absolutely excludes the existence of the finite. "The mind's intellectual love of God," says Spinoza, "is the very love by which God loves himself, not for his sake but in so far as he is expressed by the essence of the human mind, considered under the form of eternity; i.e. the mind's intellectual love of God is part of the infinite love wherewith God loves himself." This double "in so far, which returns so frequently in Spinoza, its very omnipotence at the same time the magnitude of thought, one of which must be swallowed up by the other, if they are once allowed to meet.

We have now reviewed the main points of the system, which was the ultimate result of the principles of Descartes. The importance of this first movement of modern philosophy lies in its assertion and exhibition of the unity of the intelligible world with itself and with the mind of man. In this point of view, it was the philosophical counterpart of Protestantism; but, like Protestantism in its earliest phase, it passed rapidly from the doctrine that God is, without priest or authority, present to man's spirit, to the doctrine that man's spirit is as nothing before God. The object was too powerful for the subject, who effaced himself before God that he might be strong towards men. But in this natural movement of feeling and thought it was forgotten that God who effaced the world and the finite spirit by his presence could not be a living God. Spinoza gives the ultimate expression to this tendency, and at the same time marks its limit, when he says that whatever reality is in the finite is of the infinite. But he is unsuccessful in showing that, on the principles on which he starts, there can be any reality in the finite at all. Yet even if the finite be an illusion, still more if it be better than an illusion, it requires to be accounted for. Spinoza accounts for it neither as illusory nor as real. It was reserved for the following generation of philosophers to assert, in different ways, the reality of the finite, the value of experience and the futility of abstractions. Spinoza had declared that true knowledge consists in seeing things under the form of eternity, but it is impossible that things can be seen under the form of eternity unless they have been first seen under the form of time. The one-sided assertion of individuality and difference in the schools of Locke and Leibnitz was the natural complement of the one-sided assertion of universality and unity in the Cartesian school. But when the individualistic tendency of the 18th century had exhausted itself, and produced its own refutation in the works of Kant, it was inevitable that the minds of men should again turn to the great philosopher, who, with almost perfect insight working through imperfect logic, first formulated the idea of a unity presupposed in and transcending the difference of matter and mind, subject and object.

Spinoza's biographers, especially those by Hegel, Jeugard, Bayle and Ribot, have given us numerous accounts of Spinoza's life, which we must pass over here. We may also mention C. Schareschmidt, Descentes and Spinoza (1860); C. Siwert, Spinoza's Neudrucke, Tractat von Gott, dem Menschen, and dessen Glücksgebung (1866). Both these writers have published German translations of the Tractus de deo. See also Trendelenburg, Historische Betrachtzur Philosophie (1867); R. Avenarius, Über Spinoza (1868); L. Bauer, Spinoza, ein philosophisches Bildnis (1869); J. Martineau, An Inquiry into the Life and Work of Spinoza (1862); De la Mettrie, L'essence de la philosophie (1870); M. Joel, Zur Geschicke der Lehre Spinozas (1871); R. Willis, Benedict de Spinoza: his Ethics, Life and Influence on Modern Religious Thought (1870); F. Pollock, Spinoza, his Life and Philosophy (1886); E. Martineau, The Life of Spinoza (1882); E. Pantheismus; H. H. Joachim, A Study of the Ethics of Spinoza (1901); R. Adamson, The Development of Modern Philosophy (1903); and articles DESCARTES, MALERBRANCHE, and SPINOZA.

CARTHAGE (Phoenician Kart-hadshat, "New City"); Gr. Carthago, Lat. Carthage or Carcassone, one of the most famous cities of antiquity, on the north coast of Africa; it was founded about 822 B.C. by the Phoenicians, destroyed for the first time by the Romans in 146 B.C., rebuilt by the Romans, and finally destroyed by the Arabs in A.D. 698. It was situated in the heart of the Sinus Uticensis (mod. Gulf of Tunis), which is protected on the west by the promontory of Apollo (mod. Ras Ali el Mekki), and on the east by the promontory of Mercury or Cape Bon (mod. Ras Addar). Its position naturally formed a sort of bastion on the inner curve of the bay between the Lake of Tunis on the south and the marshy plain of Utica (Sukhara) on the north. Cape Gartarat, the Arab village of Sidu-bu-Sail and the small harbour of Goletta (La Goulette, Halk el Wad) form a triangle which represents the area of Carthage at its greatest, including its extramural suburbs. Of this area the highest point is Sidu-bu-Sail, which stands on a lofty cliff about 400 ft. high. On Cape Gartarat, which was the chief cemetery; the citadel, Byrsa, was on the hill on which to-day stand the convent of Les Pères Blancs (White Fathers) and the cathedral of St Louis. The harbours lay about three fifths of a mile south of Byrsa, near the modern hospital of the Khiram, at

CARThAGE

427

On the hill of the Petit Séminaire, which is separated from Byrsa by a valley, Père Delattre has discovered a Christian basilica, the baths of Gargillus, large graves with several levels of tombs, and much débris of sculpture, which, however, is insufficient to enable us to say that this is the site of the temple of Tanit or Juno Caelestis. The quarter of Dermèche, near the sea, whose name recalls the Latin Thermis or Thermas, is remarkable for the imposing remains of the baths (thermae) of Antoninus. In one place called Douimés was the Ceramicus where excavation has discovered a graceful basilica, proto-Punic tombs, potters' ovens with numerous terra-cotta moulds which were abandoned after the siege in 146 B.C., and finally a Roman palace with superb marble statues. Farther on are huge reservoirs of Borj-Jedid which are sufficiently well-preserved to be used again.

Behind the small fort of Borj-Jedid is the plateau of the Oudeum where the theatre and fine marble statues of the Roman period have been laid bare; beyond is the great Christian basilica of Damus-el-Karita (perhaps a corruption of Domus Caritas); in the direction of Sidi-bu-Said is the plateau next, the huge stairway of which, like so many of the Carthaginian buildings, has in late years been destroyed by the Arabs for use as building material; on the coast near St Monica is the necropolis of Rabs where Delattre dug up fine anthropoid sarcophagi of the Punic period.

In the quarter of Megara (Magaria, mod. La Marsa) it would seem that there never were more than isolated buildings, villas in the midst of gardens. At Jebel Khaui (Cape Kamart) there is a great necropolis, the sepulchral chambers of which were long ago rifled by Arabs and Vandals. This cemetery had a Jewish quarter.

We must mention finally the gigantic remains in the western plain of the Roman aqueduct which carried water from Jebel Zaghwan (Mons Zeugitanus) and Juggar (Zucchara) to the cisterns of La Malga. From the nymphaeum of Zaghwan to Carthage this aqueduct is 61 Roman miles (about 56 English miles) long; in the plain of Manuba its arches are nearly 40 ft. high.

Though several famous travellers visited and described the ruins of Carthage during the first thirty years of the 19th century, such as Major Humbert, Chateaubriand, Estrup, no scientific investigations took place till 1833. In that year Captain Falbe, Danish consul at Tunis, made a plan of the ruins so far as they were visible. In 1837 the French consul at Tunis, M. Ch. Raimbaud, published his plan of theounding of Carthage, with the tombs, palais, grand gardens, columns and statues of the baths of Antoninus. The Abbé Bourdage, chaplain of the church of St Louis erected in 1841, collected together the magnum museum which was subsequently formed by Père Delattre at the instigation of Cardinal Lavigerie. Between 1856 and 1858 Nathan Davis made excavations on the supposed site of the Oudeum, and in 1859 Beulé undertook his famous investigations on Byrsa. Among other explorers were A. Daux in 1866; von Maltzan in 1870; E. de Sainte-Marie in 1874; Ch. d'Hérisson in 1883; E. Babelon and S. Reinach in 1884; Vernaz in 1885; Gauckler in 1903. Of these the majority were sent out by the French government. But their attempts were partial, disjointed and without any systematic plan; they were entirely superseded by the brilliant and persevering work of R. P. Delattre. The Musée Lavigerie, the result of his labours, contains all the archaeological treasures collected at Carthage during the last thirty years and formed by Père Delattre at the instigation of Cardinal Lavigerie. The whole of this collection has been acquired by the French government, the Government of the Roman province.

About 325 ft. from the railway station of La Malga are the still imposing ruins of the amphitheatre. Near by, at the spot called Bir el Jebana, Père Delattre has discovered four cemeteries, one of which contains the tombs of state officials or servants of the imperial government. Rather more than half a mile north-west of Byrsa are the huge cisterns of La Malga, which, at the time of the Arab geographer, Idrisi, still comprised twenty-four parallel covered reservoirs, 325 ft. by 75 ft. of these fourteen only remain.

1 The whole question of these harbours has been fully discussed by Cecil Torr, Otto Metzler, R. Oehler, S. Gsell, M. de Roquefeuil; see Aug. Audolent, Carthage romaine, pp. 198 seq.; Rene archiök. 3rd series, xxiv.; Jahrbuch f. class. Philologie, vols. cxxxv., cxxix.; also Classical Review, vol. v., viii.

The tongue of land, which runs from the harbours as far as Goletta, to the mouth of the Catadas which connects the Lake of Tunis with the sea, was known as taenia (ribbons, band) or ligula (diminutives of lingua, tongue). The isthmus connecting the peninsula of Carthage with the mainland was roughly estimated by Polybius as 25 stades (about 15,000 fts.); the peninsula itself, according to Strabo, had a circumference of 360 stades (41 m.). The distance between Gamart and Goletta is about 6 m.

From Byrsa, which is only 193 ft. above the sea, there is a fine view; thence it is possible to see how Carthage was able at once to dominate the sea and the gently undulating plains which stretch westward as far as Tunis and the line of the river Baghradas (mod. Mejdra). On the horizon, on the other side of the Gulf of Tunis, rise the chief heights of the mountain-chain which was the scene of so many fierce struggles between Carthage and Rome, between Rome and the Vandals—the Bu-Kornani ("Two-Horned Mountain"), crowned by the ruins of the temple of Saturn Balcaranensis; Jebel Ressas, behind which lie the ruins of Nefera; Zaghwan, the highest point in Zeugitan; Hammam-Lif, Rades (Ghadas, Gades, the ancient Maxula) on the coast, and 10 m. to the south-west the "white" Tunis (Nékos Týmēs of Diodorus) and the fertile hills of Ariana. All round Byrsa, alike on the plain and on the slopes, are fields of barley, vineyards and patches of cactus, interrupted only by huge heaps of rubbish and excavation-mounds, the haunts of green lizards, and by houses and villages built of materials drawn for many a century from the ancient ruins.

The ancient harbours were distinguished as the military and the commercial. The remains of the latter are to be seen in a partially ruined artificial lagoon which originally, according to Beulé, had an area of nearly 60 acres; there were, however, in addition a large quay for unloading freight along the shore, and huge basins or outer harbours protected by jetties, the remains of which are still visible at the water-level. The military harbour, known as Cothon, communicated with the commercial by means of a canal now partially ruined; it was circular in shape, surrounded by large docks 164 ft. wide, and capable of holding 220 vessels, though its area was only some 22 acres. In the centre was an islet from which the admiral could inspect the whole fleet.1

Among the other ruins which have been identified are the circus, or hippodrome, traversed by the railway at the north of the village of Duear-es-Shat; the forum, between Cothon and Byrsa, where stood the Curia, the regular place of assembly of the senate, and near which were the moneychangers' shops, the tribunal, the temple of Apollo, and in the Byzantine period the baths of Theodora. Three main streets led from the forum to Byrsa.

The hill of St Louis, the ancient citadel of Byrsa, has a circuit of 4525 ft. It appears to have been surrounded at least at certain points by several lines of fortifications. It was, however, dismantled by P. Scipio Africanus the younger, in 146 B.C., and was only refortified by Theodosius II. in A.D. 424; subsequently its walls were again renewed by Belisarius in 553. On the plateau of Byrsa have been found the most ancient of the Punic tombs, hitherto the westernmost part, and near the chapel of St Louis the foundations of the famous temple of Eschnun (see below), and the palace of the Roman proconsul.

About 325 ft. from the railway station of La Malga are the still imposing ruins of the amphitheatre. Near by, at the spot called Bir el Jebana, Père Delattre has discovered four cemeteries, one of which contains the tombs of state officials or servants of the imperial government. Rather more than half a mile north-west of Byrsa are the huge cisterns of La Malga, which, at the time of the Arab geographer, Idrisi, still comprised twenty-four parallel covered reservoirs, 325 ft. by 75 ft. of these fourteen only remain.

1 The whole question of these harbours has been fully discussed by Cecil Torr, Otto Metzler, R. Oehler, S. Gsell, M. de Roquefeuil; see Aug. Audolent, Carthage romaine, pp. 198 seq.; Revue archiök. 3rd series, xxiv.; Jahrbuch f. class. Philologie, vols. cxxxv., cxxix.; also Classical Review, vol. v., viii.
CARTHAGE

146 B.C.; (4) the periods of Roman and Byzantine rule down to the destruction of the city by the Arabs in A.D. 698.

(1) Foundation of Carthage B.C.—From the extremely remote period of Phoenician sailors who had visited the African coast and had had commercial relations with the Libyan tribes who inhabited the district which forms the modern Tunisia. In the 16th century B.C., the Sidonians already had trading stations on the coast, with the object of competing with the Tyrian colony at Utica; they established a trading station called Camēb or Cacabē on the very site afterwards occupied by Carthage. Near Bôrj-Jedid unmistakable traces of this early settlement have been found, though nothing is known of its history. According to the classical tradition, Carthage was founded about 850 B.C. by Tyrian emigrants led by Elissa or Elisar, the daughter of the Tyrian king Mutton I., fleeing from the tyranny of her brother Pygmalion. According to the story, Elissa subsequently received the name of Dido, i.e., “the fugitive.” Camēb welcomed the new arrivals, who bought from the mixed Libyo-Phoenician peoples of the neighbourhood, tributaries of the Libyan king Japon, a piece of land on which to build a “new city,” Kart-hadshat, whence the Greek and Roman forms of the name. The story goes that Dido, having obtained “as much land as could be contained by the skin of an ox,” proceeded to cut the skin of a slain ox into strips narrow enough to extend round the whole of the hill, which afterwards from this episode gained the name of Byrsa. This last detail obviously arose from a mere play on words by which Bopāre “hide,” “skin,” is confused into the two words hōrāsc, “citadel,” “fortress,” in memory of its Tyrian origin, Carthage paid an annual tribute to the temple of Melkarth at Tyr, and under the Roman empire coins were struck showing Dido fleeing in a galley, or presiding over the building of Byrsa. On the Vatican Virgil there is a representation in miniaute of workmen shaping marble blocks and columns for Dido’s palace.

The early history of Carthage is very obscure. It is only in the 6th century that real history begins. By this time the city is unquestionably a considerable capital with a domain divided into the three districts of Zeugitana (the environs of Carthage and the peninsula of C. Bon), Byzacium (the shore of the Syrtes), and the third comprising the emporia which stretch in the form of a crescent to the centre of the Great Syrtis as far as Cyrenaica. The first contest against the Greeks arose from a boundary question between the settlements of Carthage and those of the Greeks of Cyrene. The limits were eventually fixed and marked by a monument known as the “Altar of Philema.” The destruction of Tyre by Nebuchadrezzar (597 B.C.), in the first half of the 6th century, enabled Carthage to take its place as mistress of the Mediterranean. The Phoenician colonies founded by Tyre and Sidon in Sicily and Spain, threatened by the Greeks, sought help from Carthage, and from this period dates the Punic supremacy in the western Mediterranean. The Greek colonisation of Sicily was checked, while Carthage established herself on all the Sicilian coast and the neighboring islands as far as the Balearic Islands and the coast of Spain. The inevitable conflict between Greece and Carthage broke out about 535.

(2) Wars with the Greeks.—In 535, the Carthaginians, led by the suffetes Malchus, conquered almost all Sicily and expelled the Greeks. In 536 they defeated the Phocaeans and the Massaliotes before Alalia on the Corsican coast. But Malchus, having failed in Sardinia, was banished by the stern Carthaginian senate and swore to avenge himself. He laid siege to Carthage itself, and, after having sacrificed his son Calthalo to his lust for vengeance, entered the city as a victor. He ruled until he was put to death by the party which had supported him. Mago, son of Hanno, succeeded Malchus, as suffetes and general-in-chief. He was the true founder of the Carthaginian military power. He conquered Sardinia and the Balearic Islands, where he founded Port Mahon (Portus Magonis), and so increased the power of Carthage that he was able to force commercial treaties upon the Etruscans, and the Greeks of both Sicily and Italy. The first agreement between Carthage and Rome was made in 509, one year after the expulsion of the Tarquins, in the consulship of

---

Junius Brutus and Marcus Horatius. The text is preserved by Polybius (Hist. iii. 22-23). It assigned Italy to the Romans and the African waters to Carthage, but left Sicily as a dangerous neutral zone.

Mago was succeeded as commander-in-chief by his elder son Hasdrubal (c. 500), who was thrice chosen suffetes; he died in Sardinia about 485. His brother Hamilcar, having collected a fleet of 200 galleys for the conquest of Sicily, was defeated by the combined forces of Gelo of Syracuse and Theron of Agrigentum under the walls of Himera in 480, the year in which the Persian fleet was defeated at Salamis (some say the two battles were simultaneous); it is said that 15,000 Carthaginians were taken prisoners. The victory is celebrated by Pindar (Pyth. i.)

These two leaders of the powerful house of the Barcidae each left three sons. Those of Hasdrubal were Hannibal, Hasdrubal and Sapho; those of Hamilcar, Himilco, Hanno and Gisco. All under various titles, succeeded to the authority which it had already enjoyed. About 460 Hanno, passing beyond the Pillars of Hercules (Strait of Gibraltar), founded settlements along the West African coast in the modern Senegal and Guinea, and even in Madeira and the Canary Islands.

In Sicily the war lasted for a century with varying success. In 460 Hannibal and Himilco destroyed Agrigentum and threatened Gela, but the Carthaginians were forced back on their strongholds in the south-west by Dionysius the Elder. Dionysius the Younger, Timoleon and Agathocles successively, whose cause was aided by a terrible plague and civil troubles in Carthage itself. A certain Hannu, unquestionably of the Barcide house, attempted to seize the supreme power, but his partisans were overwhelmed and he himself suffered the most cruel punishment. Profiting by these troubles, Timoleon defeated the Carthaginians at Crimissus in 340, and compelled them to sue for peace. This peace was not of long duration; Agathocles crossed to Africa and besieged Carthage, which was then handicapped by the conspiracy of Bomilcar. Bomilcar was crucified, and Agathocles having been obliged to return to Sicily, his general Eumarcus was compelled to carry his army out of Africa, where it had maintained itself for three years (August 310 to October 307). After the death of Agathocles, the Carthaginians re-established their supremacy in Sicily, and Hannu even offered assistance to Rome against the invasion of Pyrrhus (280). Pyrrhus crossed to Sicily in 277, and was preparing to emulate Agathocles by sailing to Africa when he was compelled to return to Italy (see Sicily: History).

Delivered from these dangers and more arrogant than before, Carthage claimed the monopoly of Mediterranean waters, and seized every foreign ship found between Sardinia and the Pillars of Hercules. “At Carthage,” said Polybhos, “no one is blamed, however he may have acquired his wealth.” The sailors took the utmost care to conceal the routes which they followed; there is a story that a Carthaginian ship, pursued by a Roman galley as far as the Atlantic, preferred to be driven out of her course and sunk rather than reveal the course to the Cassiterides, whither she was bound in quest of tin. The owner being saved, the senate made good his losses from the public treasury (Strabo, iii. 5. 11).

(3) Wars with Rome.—The first Punic War lasted twenty-seven years (264-241); it was fought by Carthage for the defence of her Sicilian possessions and her supremacy in the Tyrrhenian Sea. The Romans, victorious at the naval battles of Mylae (Melazza) and Ecnomus (260 and 256), sent M. Atilius Regulus with an army to Africa. But the Carthaginians, by the help of the Spartan Xanthippus, were successful, and Regulus was captured. The fighting was then transferred to Sicily, where Hasdrubal was defeated at Panormus (250); subsequently the Romans failed before Lilybaenus and were defeated at Drepanum, but their victory at the Aegates Islands ended the war (241).

The identification of this Hannu with the son of Hamilcar is conjectural: see Hanno.

For the military side of these wars see Punic Wars; Hannibal; Hasdrubal.
Carthage now desired to disband her forces, but the mercenaries claimed their arrears of pay, and on being refused revolted under Segestus and Matho, pillaged the suburbs of Carthage and laid siege to the city itself. Only the genius of Hamilcar Barca raised the siege; the mercenaries were caught in the defile of the Axe, where they were cut down without mercy. This war, which all but ruined Carthage, is known to the Roman historians as the bellum inexpiable.

This peril averted, Carthage undertook the conquest of Spain. It was the work of Hamilcar, and lasted nine years up to the day of Hamilcar's death, sword in hand, in 228. His son-in-law, Hasdrubal Pulcher, built Carthage in 227 and concluded with Rome a treaty by which the Ebro was adopted as the boundary of the Carthaginian sphere. On his death the soldiers chose for themselves as leader Hannibal, son of Hamilcar. At this period Carthage, with a population of perhaps 1,000,000, was in the enjoyment of extraordinary prosperity alike in its internal industries and in its foreign trade. The manufacture of woven goods, especially, was a flourishing industry; the Greek writer Polemo records a special treaty dealing with Carthaginian fabrics, and there can scarcely be a doubt that luxury predominated throughout the ancient world. In Sicily, Italy and Greece the Carthaginians sold especially black slaves, ivory, metals, precious stones and all the products of Central Africa, which came thence by caravan. In Spain they sought copper and silver, and it was by them that the modern mines of Huelva, as also those of Osca and Carthage, were first exploited. The district round Carthage, with its amazing fertility, was the granary of the city, as it was later that of Rome. Magos had drawn up a treaty dealing with agriculture and rural economy generally, which was subsequently brought to Rome and translated into Latin by Decimus Silanus by order of the senate (J. P. Mahaffy, "The Work of Magos," in Hermathena, xv. pp. 20-35).

In the midst of this prosperity the Second War with Rome broke out. At this time the genius of Carthage is incarnate in Hannibal; his campaigns in Spain, Italy and Africa have won the admiration of military experts of all periods. The war became inevitable in 219 when Hannibal captured Saguntum, which was in alliance with Rome. Passing through Spain and Gaul, Hannibal resolved to carry the war into the heart of Italy (218-217). The battles of the Ticinus, Trebia and Tresimen Lake are but stages in the wonderful progress which culminated in the battle of Cannae (August 2, 216). The road to Rome was now open to him, but he did not profit by his advantage, while the Carthaginian senate, to its shame, withheld all further support. His brother Hasdrubal with his relieving army was defeated at the Metaurus in 207; the Romans recovered their hold in Spain, and, seeing that Hannibal was unable to move in Italy, carried the war back to Africa. Hearing that Scipio had taken Utica (203) and defeated Hasdrubal and Syphax, king of Numidia, Hannibal returned from Italy, but with a hastily levied army was defeated at Zama (October 19, 202). The subsequent peace was disastrous to Carthage, which lost its fleet and gardens of possession.

After the Second War Carthage soon revived. The population is said still to have numbered 700,000, and despite its humiliation, the city never ceased to inspire alarm at Rome. The Numidian prince Massinissa, rival of Syphax and a Roman protégé, took advantage of a clause in the treaty of 202, which forbade Carthage to make war without the consent of the Roman senate, to extend his possessions at the expense of Carthage. In response to a protest from Carthage an embassy including M. Porcius Cato the Elder was sent to inquire into the matter, and Cato was so impressed with the city as a whole that on returning to Rome he never made a speech without concluding with the warning "Delenda est Carthago!"

At this time there were three political parties in Carthage: (1) that which upheld the Roman alliance, (2) that which advocated the Numidian alliance, and (3) the popular party. These three were led respectively by Hanno, Hannibal Passer, Hasdrubal and Carthalo. The popular faction, which was turbulent and exasperated by the bad faith of the Romans, expelled the Numidian party and declared war in 149 on Massinissa, who was victorious at Orospes. Rome then intervened, determined finally to destroy her now enfeebled rival. War was declared on the Carthaginians that Carthage had engaged in war with Massinissa without the sanction of Rome. The war lasted three years, and after a heroic resistance the city fell in 146. The last champions of liberty entrenched themselves under Hasdrubal in the temple of Eshmun, the site of which is now occupied by the chapel of St. Louis. The Roman troops were let loose to plunder and burn. The thick bed of cinders, blackened stones, broken glass, fragments of metal twisted by fire, half-calcned bones, which is found to-day at a depth of 13 to 16 ft. under the remains of Roman Carthage between Byrsa and the harbours, bears grim witness, in accord with the accounts of Polybius and Appian, to the terrible fate which overtook this part of the city. Before long a commission arrived from Rome to decide the fate of the province of Carthage. In the city itself, temples, houses and fortifications were levelled to the ground, the site was dedicated with solemn imprecatiions to the infernal gods, and all human habitation throughout the vast ruined area was expressly forbidden.

Constitutional History.—The narrative must here be interrupted by an account of the political and religious institutions of Phoenician Carthage. Carthage was an aristocratic republic based on wealth rather than on birth. Indeed, the popular party, which included certain noble families such as the Barcidae, was always powerful, and in government participated, if not infrequent. So Aristotle, writing about 330, emphasizes the importance of the great wealth in Carthaginian politics. The government was in fact a plutocracy. The aristocratic party was represented by the two centuriones, chief of the army, and the senatus, which was elected by the popular assembly. The suffetes (Sefedim) presided in the senate and controlled the civil administration; the office was annual, but there was no limit to re-election. Hannibal was elected for twenty-two years. The second centurioni, who were like that of Tyre, was composed of 300 members, exercised ultimate control over all public business and war, nominated the Commission of Ten, which was charged with aiding and controlling the suffetes. This commission was subsequently replaced by a council of one hundred, called by the name of the centurio, and was thus the centurion seat of the centurio and called the generals to account, gradually became a tyrannical inquisition. Frequently it met at night in the Temple of Eshmun in Byrsa, in secret sessions described by Aristotle as ovetria ovo tranmiki.

The popular assembly was composed, not of all the citizens, but of the timunci (Gr. τυμχύ, τυμνοκ), i.e. those who possessed a certain property qualification. The election of the suffetes had to be ratified by the assembly. The centuriones, chief of the army, were elected by the centuriones, chief of the army, and this was one of the chief causes of the ruin of Carthage.

The army was recruited externally by senators who were sent to the great emporia or trade-centres, even to the most remote, to recruit soldiers with local popular support, for many of the soldiers, upon tiredness, were much in army. In addition to the mercenaries, the army contained a legion commanded by young men belonging to the best families in the state; this force was important as a nursery of officers.

Religion.—The religion of Carthage was that of the Phoenicians. Over an army of minor deities (alain in and balaim) towered the twin gods Cronus (ident. with Saturn) and Uranus (ident. with Cronus and Uranus); their father was the virgin goddess of the heavens and the moon, the Phoenician Astarte, and was known as Juno Caesarea in the Roman period; Eshmun, the principal deity and protector of the Carthaginians, generally identified with Aesculapius. There were also some special cults: of Iolus or Tammuz-Adonis, whom the Romans identified to some extent with Mercury; of the god Patechus or Pygmaeus, a deformed and monstrous god like the Egyptian Phah, whose images were placed on the prows of ships to frighten away the old Carthaginian Melkart, whose functions were analogous to those of Hercules. The statue of this god was carried to Rome after the siege of 146 (Pline, Nat. Hist. xxxvi. 12. 39). From inscriptions we know the names of instead of minor gods, such as Rabbat Ummah, "the great mother"; Baalat haedra, "mistress of the sanctuary"; Ashtoreth (Astarte), Ilat, Salom, Tsapun, Sid, Ares (id Ares).

From the close of the 2nd century B.C. the intimate relations between the Carthaginians and the Sicilian Greeks began to introduce Hellenic elements into this religion. In the forum of Carthage was a temple to Apollo containing a colossal statue, which was transported
CARTHAGE

to Rome. The Carthaginians once at least sent offerings to Delphi, and Tanit approximated to some extent to Demeter; hence on the coins we find the head of Tanit or the Punic Astarte crowned with ears of corn, in imitation of the coins of the Greek Sicilian colonies.

The symbol of Tanit is the crescent moon; in her temple at Carthage was raised a famous veil or peplus which was venerated as the city's palladium. On the innumerable votive stelae which have been unearthed, we find invocations to Tanit and Baal-Ammon, as two associated deities. One inscription is: "To the great lady Tanit, the manifestation [reflex, face] of Baal (Tanit-Pena-Baal) and to our lord Baal-Ammon, the vow of Bomilcar, son of Mag, son of Bomilcar, because they have heard his prayer" (Corp. inscr. semit. vol. i. pp. 276 f.; Audollent, Carth. Rom. p. 69).

Baal-Ammon or Moloch, the great god of all Libya, is represented as an old man with ram's horns on his forehead; the ram is frequently found with his statues. He appears also with a scythe in his hand ("fasci, fiscus, fiscillus"). St Cyprian, De idol. narrat. 14, tells us that the usual form at Carthage was a colossal bronze statue in the arms of which were placed the children who were to be sacrificed (Diod. Sic. xx. 14; Justin xviii. 6. xix. 1. Plut. De superstit. 13. De seris num. vind.)

At Carthage children were sacrificed to him, and in his temple there was a colossal bronze statue in the arms of which were placed the children who were to be sacrificed (Diod. Sic. xx. 14; Justin xviii. 6. xix. 1. Plut. De superstit. 13. De seris num. vind.). At Carthage children slipped one by one from the arms into a furnace amid the plaudits of fanatical worshippers. These sacrifices persisted even under Roman rule; Tertullian states that even in his time they took place in the temple of Tanit. (De inscript. de Carth., in Bull. épigraphique, iv. p. 317; Audollent, op. cit. p. 398).

(a) Roman Period.—In 122 B.C., twenty-four years after the destruction of the city by Scipio Amilianus, the Roman senate, on the proposal of Rubrius, decided to plant a Latin colony on the site. C. Gracchus and Fulvius Flaccus were entrusted with the foundation of the new city, which was christened Colonia Junonia, and placed under the protection of Juno Caestis, the new name for the Punic Tanit. But its prosperity was obstructed not only by unpropitious omens and by the very recollection of the ancient feud, and fifty years later Marius, proscribed by Sulla, found the ruins practically deserted.

In the neighbourhood were the scattered remnants of the old Punic population, who, according to Athenaeus (Deipnosoph. v. 50), had actually to send ambassadors to Mithradates the Great assuring him of their support against Rome. Ultimately M. Minucius Rufus passed a law abrogating that of 122 and suppressing the Colonia Junonia.

Julius Caesar, pursuing the last supporters of Pompey, encamped on the ruins of the city, and there, according to tradition, had a dream which induced him to re-establish the abandoned colony. Returning to Rome, he dispatched thither the poor citizens who were demanding land from him. Later on Augustus sent new colonists, and, henceforward, the machinery of administration was regularly centred there (Appian viii. 136; Dio Cass. lxxx. 1; Audollent, op. cit. p. 46). The proconsuls of the African province had hitherto lived at Utica; in 14-13 B.C. C. Semius Saturninus transferred his headquarters to Carthage, which was henceforth known as Colonia Julia Carthago.

Several inscriptions use this name, as also the bronze coins which bear the heads of Augustus and Tiberius, and were struck at first in the name of the sufixes, afterwards in that of duumvir.

Pomponius Mela and Strabo already describe Carthage as among the greatest and most wealthy cities of the empire. Herodians put it second to Rome, and such is the force of tradition that the Roman citizens resident in Carthage boasted of its Punic past, and loved to recall its glory. Virgil celebrated the misfortunes of Divi, whom the colonists ultimately identified with Tanit-Astarte; a public dude-cult grew up, and the temple at Carthage pretended to have discovered the very house from which she had watched the departure of Aeneas. The religious character of these legends, coupled with the city's resumption of its old rite as mistress of Africa, and its independent spirit, reawakened the old distrust, and even up to the invasions of the Vandals the jealous rivalry of Rome forbade the reconstruction of the city walls.

The revolt of L. Clodius Macer, legate of Numidia, in a.d. 68 was warmly supported by Carthage, and one of the coins of this short-lived power bears the symbol of Carthage personified. At the moment of the accession of Vitellius, Piso, governor of the province of Africa, was in his turn proclaimed emperor at Carthage. A little later, under Antoninus Pius, we read of a fire which devastated the quarter of the forum; about the same time, i.e. under Hadrian and Antoninus, there was built the famous Zaghbun aqueduct, which poured more than seven million gallons of water a day into the reservoirs of the Mapalia (La Malga); the cost of this gigantic work was defrayed by a special tax which pressed heavily on the inhabitants as late as the reign of Septimius Severus; but the coin-types of this emperor (E. Babelon, Rivista italiana di numismatica, 1903, p. 157).

In the early history of Christianity Carthage played an auspicious part, in virtue of the number of its disciples, the energy and learning of their leaders, the courage and eloquence of its teachers, the persecutions of which it was the scene, the number of its councils and the heresies of which it witnessed the birth, propagation or extinction (see CARTHAGE, SYNODS OF). The labours of Delattre have filled the St Louis museum at Carthage with memorials of the early church. From the end of the 2nd century there was a bishop of Carthage; the first was Agrippinus, the second Optatus. At the head of the apologists, whom the persecutions inspired, stands Tertullian. In 202 or 203, in the amphitheatre, where Cardinal Lavigerie erected a cross in commemoration, occurred the martyrdom of Perpetua and Felicitas. Tertullian was succeeded (248) by a less famous bishop Cyprian. About this time the proconsul Gordian had himself proclaimed (239) emperor at Thysdrus (El Jem). Shortly afterwards Sabinianus, aspiring to the same dignity, was besieged by the procurator of Mauretania; the inhabitants gave him up and thus obtained a disgraceful pardon (R. Cagnat, L'armée romaine d'Afrique, p. 52; Audollent, op. cit. p. 73). Peace being restored, the persecution of the Christians was renewed by an edict of the emperor Decius (250). Cyprian escaped by hiding, and subsequently caused the heresy of Novatian to be condemned in the council of 251. In 257, in a new persecution under Valerian, Cyprian was beheaded by the proconsul Galerius Maximus.

About 264 or 265 a certain Celsus proclaimed himself emperor at Carthage, but was quickly slain. Probus, like Hadrian and Severus, visited the city, and Maximian had new baths constructed. Under Constantius Chlorus, Maxentius proclaimed himself emperor in Africa; this caused great excitement in Carthage, and the garrison, which was hostile to the pretender, compelled L. Domitius Alexander to assume the purple. Domitius was, however, captured by Maxentius and strangled at Carthage. About 311 there arose the famous Donatist heresy, supported by 270 African bishops (see DONATISTS and CONSTANTINE I.). At the synod of Carthage in 411 this heresy was condemned owing to the eloquence of Augustine. Two years later the Carthaginian sectaries even ventured upon a political rebellion under the leadership of Herachius, who proclaimed himself emperor and actually dared to make a descent on Italy itself, leaving his son-in-law Sabinus in command at Carthage. Being defeated he fled precipitately to Carthage, where he was put to death (413). Donatism was followed by Pelagianism (see PELAGIUS), also the Carthaginian origin, and these religious trespasses were settled when in May 426 the Vandals, in the appeal of Count Boniface, governor of Africa, crossed the Straits of Gibraltar and invaded Mauretania. Gener-
CARThAGE—CARTHAGE, SYNODS OF

BYZANTINE RULE.—Under Genseric's successors (see VANDALS), Carthage was still the scene of many displays of savage brutality, though Thrasamund built new baths and a basilica. Ultimately Gelimer, the last Vandal king, was defeated at Ad Decimum by the Byzantine army under Belisarius, who entered Carthage unopposed (September 14, 533). The restored city now received the name of Colonia Justimiana Carthago; Belisarius rebuilt the walls and entrusted the government to Solomon. New basilicas and other monuments were erected, and Byzantine Carthage recovered for a century the prosperity of the Roman city.

At length the Arabs, having conquered Cyrenaica and Tripolitana (647), and founded Kairawân (670), arrived before Carthage. In 697 Hasan ibn en-Noman, the Gassanid governor of Egypt, captured the city almost without resistance. But the garrison left by the Arabs was quite unable to defend itself against the patrician Joannes, who retook the city and hastily put it in a state of defence. Hasan returned furious with anger, defeated the Byzantines again, and decreed the entire destruction of the city. His orders were fulfilled; and in 698 Carthage finally disappears from history. Once again only does the name appear in the annals of the world, when the French king Louis X., at the head of the eighth crusade, disembarked there on the 17th of July, 1270. He died, however, of the plague on the 25th of August, without having recovered northern Africa for civilization.

BIBLIOGRAPHY.—I. ANCIENT.—(a) Polybius, Diodorus Siculus, Livy, Appian, Justin, Strabo; (b) for the Christian period, Tertullian, Cyprian, Augustine; (c) for the Byzantine and Vandal, Procopius and Victor de Vita. All the references to the topography of Roman and Byzantine Carthage are collected in Audoult, Carthago romaine (1901), pp. 725-825, which also contains a full list of modern works (pp. 13-32, and p. 835).

CARTHAGE, a city and the county-seat of Jasper county, Missouri, U.S.A., on the Spring river, about 90 ft. above sea-level, and about 159 m. S. by E of Kansas City. Pop. (1890) 798; (1900) 9416, of whom 539 were negroes; (1910 census) 9483. It is served by the St Louis & San Francisco, the Missouri Pacific, and the St Louis, Iron Mountain & Southern railways, and is connected with Webb City and Joplin, Mo., and Galena, Kan., by the electric line of the Southwest Missouri railway. The town is built on high ground underlain by solid limestone, and has much natural and architectural beauty. It is the seat of the Carthage Collegiate Institute (Presbyterian). A Chautauqua assembly and a county fair are held annually. In the vicinity there are valuable lead, zinc and coal mines, and quarries of Carthage "marble," with which the county court house is built. Carthage is a jobbing centre for a fruit and grain producing region; live-stock (especially harness horses) is raised in the vicinity; and among the city's manufactures are lime, flour, canned fruits, furniture, bed springs and mattresses, mining and quarrying machinery, ploughs and woolen goods.

In 1905 the factory products were valued at $1,170,661. Natural gas for domestic use and for factories is piped from the Kansas gas fields. The municipality owns and operates the electric lighting plant. Carthage, founded in 1833, was laid out as a town and became the county-seat in 1842, was incorporated as a town in 1868, was chartered as a city in 1873, and in 1890 became a city of the third class under the general (state) law. On the 4th of July 1861 about 3500 Confederates under General James E. Rains and M. M. Parsons, accompanied by Governor Claiborne Fox Jackson (1807-1862), and 1500 Union troops under Colonel Franz Sigel, were engaged about 7 m. north of the city in an indecisive skirmish which has been named the battle of Carthage.

CARThAGE, SYNODS OF. During the 3rd, 4th, and 5th centuries the town of Carthage (q.v.) in Africa served as the meeting-place of a large number of church synods, of which, however, only the most important can be treated here.

1. In May 251 a synod, assembled under the presidency of Cyprian to consider the treatment of the lopsi (those who had fallen away from the faith during persecution), excommunicated Felicissimus and five other Novatian bishops (Rigorists), and declared that the lopsi should be dealt with, not with uncinate severity, but according to the degree of individual guilt. These decisions were confirmed by a synod of Rome in the autumn of the same year. Other Carthaginian synods concerning the lopsi were held in 252 and 254.

3. Two synods, in 255 and 256, held under Cyprian, pronounced against the validity of heretical baptism, thus taking direct issue with St. Augustine of Hippo, who promptly repudiated them, and separated himself from the African Church. A third synod, September 256, unanimously reaffirmed the position of the other two. Stephen's pretensions to authority as "bishop of bishops" were sharply resented, and for some time the relations of the Roman and African Churches were severely strained.

5. The Donatist schism (see DONATISTS) occasioned a number of important synods. About 348 a synod of Catholic bishops, who had met to record their gratitude to the emperor for the suppression of the "Circumcelliones" (Donatist terrorists), declared against the rebaptism of any one who had been baptized in the name of the Trinity, and adopted twelve canons of clerical discipline.

7. The "Conference of Carthage" (see DONATISTS), held by imperial command in 411 with a view to terminating the Donatist schism, while not strictly a synod, was nevertheless one of the most important assemblies in the history of the African church, and, indeed of the whole Christian church.

9. On the 1st of May 418 a great synod ("A Council of Africa," St Augustine calls it), which assembled under the presidency of Aurelius, bishop of Carthage, to take action concerning the heretical Pelagius, a disciple of Pelagius (q.v.), denounced the Pelagian doctrines as "false, heretical, against the nature of original sin, grace and perfection," and fully approved the contrary views of Augustine. Prompted by the reinstatement of the bishop of Rome of a deposed African priest, the synod enacted that "whosoever appeals to a court on the other side of the sea (meaning Rome) may not again be received into communion by any one in Africa" (canon 17).

the bishop of Rome, Celestine, protesting against his claim to appellate jurisdiction, and urgently requesting the immediate recall of his legate, and advising him to send no more judges to Angoulême.

**CARTHUSIANS**, an order of monks founded by St Bruno (q.v.).

In 1084 Bruno and his six companions presented themselves before the bishop of Grenoble and explained to him their desire to lead an ascetic life in a solitary place. He pointed out to them a desolate spot named Chartreuse, on the mountains near Grenoble, rocky and precipitous, and snow-covered during a great portion of the year, and told them they might there carry out their design. They built themselves three huts and an oratory, and gave themselves up to a life of prayer and silence and extreme austerity. After a few years Bruno was summoned to Rome by Urban II., as an adviser in the government of the Church, c. 1090; but after a year or so he obtained permission to withdraw from Rome, and was able to find in the forests of Calabria near Squillace a second, and later on a third and a fourth monastery, on the same lines as the Chartreuse. On one of these south Italian foundations Bruno died in 1101. On leaving the Chartreuse he had appointed a successor as superior, and the institute steadily took more settled shape and further development. Peter the Venerable, abbot of Cluny, writing about forty years later, speaks thus of the mode of life of the earliest Carthusians:

> Warned by the negligence and lukewarmness of many of the older monks, they adopted for themselves and for their followers greater precaution against the offenses of the Evil One. As regards the main-features, they observed a certain dress, more poor and contemptible than that of any other religious body; so that it is horrible to look on these garments, so short, scanty, coarse and dirty are they. In order to cut out avarice by the roots, they enclosed their lands and their churches in a certain quantity of land, more or less, according to the fertility of the district; and they would not accept a foot of land beyond that limit if you were to offer them the whole world. For the same motive they limited the quantity of their cattle, oxen, asses, sheep and goats. And in order that they might have no motive for augmenting their possessions, either of land or animals, they ordained that in every one of their monasteries there should be no more than twelve monks, with their prior the thirteenth, eight lay brethren, and a few poor people, such as they choose. Their dress was of coarse linen; they always wear a hair shirt of the deepest sort, and their fasting was well liberal. They always eat bread of unboiled meal, and take so much water with their wine that it has hardly any flavor and is at the same time very pleasant to the palate. They never eat flesh; when they are ill, they never eat meat; when they are well or ill, they never buy fish, but they accept if it is given to them for charity. They may eat cheese and eggs only on Sundays and Tuesdays. On Mondays, Wednesdays, and Fridays they take only bread and water. They eat once a day only, save during the months of Christmas, Easter, Pentecost, Epiphany and other solemnities. They live in separate little houses like the ancient monks of Egypt, and they occupy themselves exclusively with reading and prayer and the office of their hands, especially the writing of books. They recite the prayers for minor canonical hours in their own dwellings, when warned by the bell of the church; but they all assemble in church for matins and vespers. On feast days they eat twice a day, and six times a week they have flesh in their refectory. They do not say mass save on festivals and Sundays. They boil the vegetables served out to them in their own dwellings, and never drink wine save with their food.

(Migne, *Patrol. Lat.* clxxxix. 943.)

In its broad outlines this description of primitive Carthusian life has remained true, even to the present day: the regulations as to food are not quite so stringent, and the habit is now an ordinary religious habit of white serge. But it is notorious that the Carthusians have frequently constituted a separate religious order of the old Capuchin act. Owing to its very nature, the institute never had any great expansion: at the middle of the 13th century there were some 50 Charterhouses; at the beginning of the 18th there were 175, 75 being in France.

There was no written rule before 1130, when Guigo, the fifth prior of the Grande Chartreuse, reduced to writing the body of customs that had been the basis of Carthusian life (Migne, *Patrol. Lat.* clxi. 631); enlargements and modifications of this code were made in 1259, 1367, 1509 and 1681: this last form of the statutes is the present Carthusian rule.

The life is very nearly eremitical: except on Sundays and feasts, the Carthusians meet only three times a day in the church—for the Midnight Office, for Mass and for Vespers. Once a week, on Sundays (and feasts) they have their meal in the refectory, and once a week they have recreation together and a walk outside enclosure. All the rest of their time is passed in solitude in their hermitages, which are built quite separate from one another. Each hermitage is a house, containing living-room, bedroom and oratory, workshop and store-room, and has a small garden attached. The monks are supplied with such tools as they wish to employ in workshop and garden, and with such books as they need from the library. The Carthusian goes to bed every evening at 7 and is called about 11, when he says in his private oratory the *Officium B. Mariae Virginis*. Towards midnight all repair to the church for Matins and Lauds, which are celebrated with extraordinary solemnity and propriety, so as to last from 2 to 3 hours, according to the office. They then return to bed until 5, when they again go to the church for the daily High Mass, still celebrated according to the phase of liturgical and ritual development of the 11th century. The private Masses are then said, and the monks betake themselves to their studies for a few hours, and have a light meal. In the last days they have their dinner, alone except on Sundays and feasts; the dinner is supplied from the common kitchen through a small window. On many days of the year there is but one meal; meat is never eaten, even in sickness: this has always been an absolute rule among the Carthusians. In the afternoon they again assemble in the church for Vespers; the lesser portions of the canonical office, as well as the Office of the Blessed Virgin and the Office of the Dead, are said privately in the oratories.

This manner of life has been kept up almost without variation for eight centuries: among the Carthusians there have never been any of those revivals and reforms that are so striking a feature in the history of other orders—“never reformed, because never deformed.” The Carthusians have always lived thus wholly cut off from the outer world, each one in almost entire isolation. They introduced and have kept up in western Europe a life resembling that of the early Egyptian monks, as under St Anthony’s guidance monasticism passed from the utter individualism of the first hermits to the half eremitical, half cenobitical, life of the early cenobites. Owing to certain embarrassments in external matters to the Benediction, the rule and practice, the Carthusians have sometimes been regarded as one of the offshoots from the Benedictines; but this view is not tenable, the whole Carthusian conception, idea and spirit being quite different from the Benedictine.

The superiors of the Charterhouses are priors, not abbots, and the prior of the Grande Chartreuse is the superior general of the order. A general chapter of the priors is held annually at the Grande Chartreuse. The Carthusians have always flourished most in France, but they had houses all over western Europe; some of the Italian Certe, as those at Pavia, Florence and Naples, are renowned for their wonderful beauty.

The first English Charterhouse was established in 1178 at Witham by Selwood Forest, and at the Dissolution there were nine, the most celebrated being those at Sheen in Surrey and at Smithfield in London (for list see *Catholic Dictionary, art. “Carthusians”). The Carthusians were the only order that made any corporate resistance to the ecclesiastical policy of Henry VIII. The confraternity of the London Charterhouse stood firm, and the prior and several of the monks were put to death in 1535 under circumstances of barbarous cruelty. In Mary’s reign a community was reassembled at Sheen, and on her death it emigrated, fifteen in number, to Flanders, and finally settled in Nieuport; it maintained itself as an English community for a considerable time, but gradually dwindled, and the last of the old English Carthusian stock died in 1831. There is now one Charterhouse in England established at Parkminster in Sussex in 1833; the community numbers 50 choir-mons, but it is almost wholly made up of foreigners, including many of those recently expelled from France.

At the French Revolution the monks were driven from the
Grande Chartreuse, but they returned in 1816; they were again driven out under the Association Laws of 1891, and the community of the Grande Chartreuse is now settled in an old Certosa near Lucca. Of late years the community at the Grande Chartreuse had consisted of some 40 choir-munks and 20 lay brothers. Before the recent expulsions from France there were in all some 20 Chartreuses.

There have been since the middle of the 17th century a very few convents of Carthusian nuns, not more than ten; in recent times there have been but two or three, situated a few miles from the Grande Chartreuse. The rule resembles that of the monks, but the isolation, solitude and silence are much less stringent. The habit of the Carthusians, both monks and nuns, is white.

A word may be added as to the famous liqueur, known as Chartreuse, made by the monks. At the Revolution the property of the Carthusians was confiscated, and on their restoration they recovered only the barren desert in which the monastery stood, and for it they had to pay rent. Thus they were for some years in want even of the needless means of subsistence. Then the liqueur was invented as a means of supplying the wants of the community; it became a great commercial success and produces a large yearly income. This income the monks have not spent on themselves, nor does it accumulate. The first charge is the maintenance of the Grande Chartreuse and the other Chartreuse-houses, and out of it have been built and established the new monasteries of Chartreuse. In Düsseldorf, Parkminster and elsewhere a body far the largest portion has been spent on religious and charitable purposes in France and all over the world,—churches, schools, hospitals, almshouses, foreign missions. One thing is certain: the profits made no difference at all to the secluded and austere life of the monks of the Grande Chartreuse.

AUTHORITIES.—The most comprehensive historical work on the Carthusian order is B. Tromby, Storia del patriarcato S. Brunone e del suo ordine (10 vols., 1773). References to other histories, old and new, will be found in Max Hembucher, Orden u. Kongregationen (1896), § 36; Wetter und Welte, Kirchenlexicon (ed. 2), art. "Karthusiernorden"; Herzog-Hauk, Riencyclopaedie (ed. 3), art. "Karthusner"; For the English Carthusians, see E. Margaret Thompson, Somerset Carthusians (1895), and Dom L. Hendriks, London Charterhouse (1889). The best study on St Bruno and the foundation of the order is Hermann Lübel. "Der Stifter des Karthusiernordens," 1889 (vol. v. No. 1 of Kirchengeschichtliche Studien), in which he gives an account of Cartier (Alfred Tholord (Dublin Review, April 1892), who spent some months in the noviciate at the Grande Chartreuse. A little tract (anonymous) translated from French, The Carthusians (1902 (Orphans Press, Buckley Hall, Rochdale), gives precise information on the history, spirit and life of the Carthusians.

CARTIER, SIR GEORGES ÉTIENNE, Bart. (1814-1873), Canadian statesman, was born in the province of Quebec on the 6th of September 1814. Called to the bar in 1835, he soon gained a large practice. He took part in the rebellion of 1837, and was forced for a time to fly the country. In 1848 he was elected to the Canadian parliament. His youthful ebullition of 1837 was soon repented of, and he became a loyal subject of the British crown. So greatly had he changed that in 1854 he became a leading member of the reconstructed Liberal-Conservative party. In 1855 he was appointed provincial secretary, and in 1857 attorney-general for Lower Canada. From 1858 to 1862 he and Sir John Macdonald were joint prime ministers of Canada, and their alliance lasted till the death of Cartier. He took the chief part in promoting many useful measures, such as the consolidation of several townships in Lower Canada (1858), and the codification of the civil law of the province (1857–1864). Above all he favoured the construction of railways, and to his energy and fearless optimism are largely due the eventual success of the Grand Trunk railway, and the resolve to construct the Canadian Pacific. In the face of great opposition, he carried his native province into federation (1864–1867), which would have been impossible without his aid. In the first cabinet of Sir John Macdonald he sat as minister of militia and defence, and carried in 1868 an important act establishing the land forces of Canada on a sound basis. Though a devout Catholic, he became involved in a political squall with his church, and was defeated by clerical influence at the general election of 1872. Another seat was found for him, but his health failed and he died on the 20th of May 1873.

The Life, by Alfred O. De Celles (Toronto, 1904), may be supplemented by the sketch in Dent's Canadian Portrait Gallery (Toronto, 1880).

CARTIER, JACQUES (1491-1557), French navigator, discoverer of the Canadian river St Lawrence, was born at St Malo in Brittany. Of his early life nothing is known. On the suppression by Admiral Chatot of the trade to Brazil, an expedition consisting of two ships and sixty-one men was despatched from St Malo under Cartier on the 20th of April 1534, to look for a north-west passage to the East. Cartier reached Newfoundland on the 10th of May, and at once entered the strait of Belle Isle, then known to the fishermen as the bay of Castles. While the ships renewed their supply of wood and water in Belle Isoms harbour on the north side of the strait, the long-boats discovered that the coast farther west was barren, rocky and uninviting. In view of this Cartier set sail on Monday, the 15th of June, for the south side of the strait, by following which he was led down almost the whole west coast of Newfoundland. Off St George's Bay a storm drove the ships out into the gulf, but on resuming his course Cartier fell in with the Blid Rocks. The island south of these he named Brion Island, after Chatot; his mistake for the mainland was for the main shore on the south side of this inland sea. Following the coast of New Brunswick northward he was greatly disappointed to discover Chaleur Bay was not a strait. During a ten days' stay in Gaspé Harbour Cartier made friends with a tribe of Huron-Iroquois Indians from Quebec, two of whom he carried off with him. A mirage deceived him into thinking the passage up the river south of Anticosti was a bay, whereupon he proceeded to coast the southern, eastern and northern shores of Anticosti. On discovering the passage between this island and the Quebec shore a council was held, at which it was decided to postpone the exploration of this strait until the following year. Heading eastward along the Quebec shore, Cartier soon regained the Strait of Belle Isle and, entering the Atlantic on the 15th of August, reached St Malo in safety on the 5th of September.

Cartier set sail again from St Malo with three vessels on the 16th of May 1536, and passing through the strait of Belle Isle anchored on the 9th of August in Besilia Bay, opposite Anticosti. The next day he named this the bay of St Lawrence. In course of time the name spread to the gulf and finally to the river. Proceeding through the passage north of Anticosti, Cartier anchored on the 1st of September at the mouth of the Saguenay, which the two Indians who had passed the winter in France informed him was the name of a kingdom "rich and wealthy in precious stones." Again on reaching the island of Orleans, so named after the third son of Francis I., they told Cartier he was now in the kingdom of Canada, in reality the Huron-Iroquois word for village. Leaving his two larger vessels in the St Charles, which there enters the St Lawrence, Cartier set off westward with the bark and the long-boats. The former grounded in Lake St Peter, but in the latter he reached, on the 2nd of October, the Huron-Iroquois village of Hochelaga on the site of the city of Montreal. Further progress was checked by the Lachine Rapid. From the top of Mount Royal, a name still in use, Cartier beheld the St Lawrence and the Ottawa stretching away to the west. On his return to the St Charles, where during the winter twenty-five men died of scurvy, Cartier sought further information about the rich country called Saguenay, which he was informed could be reached more easily by way of the Ottawa. In order to give Francis I. authentic information of this northern Mexico, Cartier seized the chief and eleven of the headmen of the village and carried them off to France. This time he passed south of Anticosti and, entering the Atlantic through Cabot Strait, reached St Malo on the 16th of July 1537.

Francis I. was unable to do anything further until the spring of 1541, when Cartier set sail with five vessels and took up
his quarters at Cap Rouge, 9 m. above Quebec. A soldier, the
seigneur de Roberval, had been chosen to lead the men to the
conquest of Saguenay; but when he did not arrive, Cartier made
a fresh examination of the rapid of Lachine, preparatory to
sending the men up the river Ottawa. Roberval at length set
sail in April 1542, but on reaching St John's, Newfoundland, met
Cartier on his way back to France. In the summer of 1543,
Cartier was sent out to bring home Roberval, whose attempt to
make his way up the Ottawa to this mythical Saguenay had
proved futile. From 1544 until his death at St Malo, on the 1st
of September 1557, Cartier appears to have done little else than
to give technical advice in nautical matters and act as Portuguese
interpreter.

A critical edition of Cartier's *Brie Récit de la navigation faite es
îles de Canada* (1545), from the MSS., has been published by the
university of Toronto. The best English version is that by James
Phiney Baxter, published at Portland, Maine, in 1906. (H. P. B.)

**CARTILAGE** (Lat. cartilage, gristle,) the firm elastic and gristly
connective tissue in vertebrates. (See CONNECTIVE TISSUES and
SKELETAL TISSUES.)

**CARTOON** (Ital. cartone, pasteboard,) a term used in pictorial
art in two senses. (1) In painting, a cartoon is used as a model
for a large picture in fresco, oil or tapestry, or for statuary.
It was also formerly employed in glass and mosaic work. When
cartoons are used in fresco-painting, the back of the design
is covered with black-lead or other colouring matter; and, this
side of the picture being applied to the wall, the artist passes over
the lines of the design with a point, and thus obtains an impression.
According to another method the outlines of the figures are
pricked with a needle, and the cartoon, being placed against the
wall, is "pounced," *i.e.* a bag of black colouring-matter is drawn
over the perforations, and the outlines are thus transferred to the
wall. In fresco-painting, the portions of the cartoon containing
figures were formerly cut out and fixed (generally in successive
sections) upon the moist plaster. Their contour was then traced
with a pointed instrument, and the outlines appeared lightly
incised upon the plaster after the portion of the cartoon was
withdrawn. In the manufacture of tapestries upon which it is
wished to give a representation of the figures of cartoons, these
figures are sometimes cut out, and laid behind or under the woof,
to guide the operations of the artists. In this case the cartoons
are coloured.

Cartoons have been executed by some of the most distinguished
masters; the greatest extant performances in this line of art
are those of Raphael. They are seven in number, coloured in
disterper; and at present they adorn the Victoria and
Albert Museum, in South Kensington, having been removed
thither from their former home, the palace of Hampton Court.
With respect to their merits, they count among the best of
Raphael's productions; Lanzi even pronounces them to be
in beauty superior to anything else the world has ever seen.
Not that they all present features of perfect loveliness, and limbs
of faultless symmetry,—this is far from being the case; but in
harmony of design, in the universal adaptation of means to one
great end, and in the grasp of soul which they display, they stand
among the foremost works of the designing art. The history of
these designs is curious. Leo X. Raphaelizing (in 1515-1516) a series of Scriptural subjects, which were
first to be finished in cartoons, and then to be imitated in tapestry
by Flemish artists, and used for the decoration of the Sistine
Chapel. Two principal sets of tapestries were accordingly
executed at Arras in Flanders; but it is supposed that neither
Leo nor Raphael lived to see them. The set which went to Rome
was twice carried away by invaders, first in 1527 and afterwards in
1798. In the first instance they were restored in a perfect state;
but after their return in 1814 one was wanting—the cupidity of a
Genoese having induced him to destroy it for the sake of the
precious metal which it contained. Authorities differ as
to the original number of cartoons, but there appear to have
been twenty-five,—some by Raphael himself, assisted by Gian-
francesco Penni, others by the surviving pupils of Raphael.
The cartoons after which the tapestries were woven were not,
it would seem, restored to Rome, but remained as lumen
about the manufacture in Arras till after the revolution of the
Low Countries, when seven of them which had escaped destruc-
tion were purchased by Charles I., on the recommendation of
Rubens. They were found much injured, "holes being pricked
in them for the weavers to pounce the outlines, and in other parts
they were almost cut through by tracing." It has never been
ascertained what became of the other cartoons. Three tapestries,
the cartoons of which by Raphael no longer exist, are in the
Vatican,—representing the stoning of St Stephen, the conversion
of St Paul, and St Paul in prison at Philippi.

Besides the cartoons of Raphael, two, to which an extra-
ordinary celebrity in art-history attatches, were those executed
in competition by Leonardo da Vinci and by Michelangelo—the
former named the Battle of the Standard, and the latter the
Cartoon of Pisa—soldiers bathing, surprised by the approach of
the enemy. Both these great works have perished, but the
general design of them has been preserved. In recent times
some of the most eminent designers of cartoons have been masters
of the German school,—Cornelius, Kaulbach, Steinele, Fuhrih,
and Herkomer, as a general rule, these artists appear to greater
advantage in the cartoon than in the complete painting of the
same compositions. In England cartoon-work developed consider-
ably in 1843 and 1844, when a competition was held for the
decoration of the new Houses of Parliament. Dyce and Maclise,
left examples of uncommon mark in this line. The cartoon by
Fred. Walker, A.R.A., made to advertise the dramatic version of
Wilkie Collins's *Woman in White*, is now at the Tate Gallery; and
cartoons by Ford Madox Brown are in the Victoria and Albert
Museum, South Kensington. (W. M. R.)

(2) "Cartoon" is also a term now applied to the large political
drawings in the humorous or satirical papers of the day. At
an earlier period satirical prints were styled "caricatures," and were
issued separately. Gillray, Rowlandson, the three Cruikshanks,
Heath and others were popular favourites in this class of design.
Even the insignificant little cuts by Robert Seymour in *Pigaro in
London*, the diableries in *The Fy*, and the vulgar and rancorous
political skits identified with the flood of scrurious little papers
of the time, were dignified by the same term. The long series of
*Political Sketches* by "H. B." (John Doyle) were the first
examples of an exaggerated statement, and fair and decorous
directoire. With the advent of *Punch* and its various rivals (*The
Peep-Show, The Great Gun, Diogenes* and the like), the general
tone was elevated. *Punch* at first adopted the word "pencilling"
to describe the "big cut," which dealt variously with political
and social topics. But when in 1843 there was held in West-
minster Hall the great exhibition of "cartoons" from which
selection was to be made of designs for the decoration in fresco
of the new Houses of Parliament, *Punch* jocularly professed to
range himself alongside the great artists of the day; so that the
"mad designe" of the reign of Charles I. became the "cartoon"
of that of Queen Victoria. John Leech's drawing in No. 105 of
that journal was the first caricature to be called a cartoon: it was
entitled "Substance and Shadow: The Poor ask for Bread, and
the Philanthropy of the State accords—an Exhibition." Later,
*Punch* dropped the word for a while, but the public took it up.
Yet the *New English Dictionary* curiously attributes the first use of
it to Miss Braddon in 1863.

In England the cartoon, no longer a weapon of venomous
attack, has come to be regarded as a humorous or sarcastic
comment upon the topic uppermost in the nation's mind, a witty
or satiric illustration of views already formed, rather than as
an instrument for the manufacture of public opinion. It has
almost wholly lost its rancour; it has totally lost its ferocity—
the evolutionary result of peace and contentment, for satire in
its more violent and more spontaneous form is but the outcome
disatisfaction or the rage of the multitude. The cartoon, it is
agreed, must be suggestive; it must present a clear idea lucidly
and, if possible, laughably worked out; and, however reserved
or restrained it may be, or even, when occasion demands (as
in the case of Sir John Tenniel and some of his imitators),
however epic in intution, it must always figure, so to say, as a leading
article transformed into a picture. (See Caricature and Illustration.) (M. H. S.)

CARTOUCHE (a French word adapted from the Ital. cartoccio, a roll of paper, Med Lat. carta, for charta, paper), originally a roll of paper, parchment or other material, containing the charge of powder and shot for a firearm, a cartridge (q.v.), which itself is a corruption of cartouche. The term was applied in architecture to various forms of ornamentation taking the shape of a scroll, such as the volute of an Ionic capital. It was particularly used of a sculptured tablet in the shape of a partly unrolled scroll on which could be placed an inscription or device. Such "cartouches" are used for titles, &c., on engravings of maps, plans, and the like. The arms of the popes and ecclesiastics of high birth were borne on an oval cartouche; and it is thus particularly applied, in Egyptian archaeology, for the oblong device with oval ends, enclosing the names of royal personages on the monuments. It is properly an oval formed by a rope knotted at one end. An amulet of similar shape, as the symbol of the "name," was worn by men and women as a protection against the blighting out of the name after death.

CARTRIDGE (corruption of Fr. cartouche), a case, of brass or other metal, cardboard, silk, flannel, &c., containing an explosive charge, and usually the projectile also, for small arms and ordnance (see AMMUNITION).

CARTWRIGHT, EDMUND (1743-1823), English inventor, younger brother of Major John Cartwright (q.v.), was born at Marnham, Nottinghamshire, on the 24th of April 1743, and educated at Wakefield grammar school. He began his academic studies at University College, Oxford, and in 1764 he was elected to a fellowship at Magdalen. In 1770 he published "Armine and Ethria," a legendary poem, which was followed in 1779 by "The Prince of Peace." In 1770 he was presented to the rectory of Roadby Marwood, Leicestershire, to which in 1786 was added a prebend in the cathedral of Lincoln. He took the degree of D.D. at Oxford in 1786. He would probably have passed an obscure life as a country clergyman had not his attention been accidentally turned in 1784 to the possibility of applying machinery to weaving. The result was what he invented a power-loom, for which he took out a patent in 1785; it was a rude contrivance, though it was improved by subsequent patents in 1786 and 1787, and gradually developed into the modern power-loom. Removing to Doncaster in 1785, he started a weaving and spinning factory; it did not, however, prove a financial success, and in 1793 he had to surrender it to his creditors. A mill at Manchester, in which a number of his machines were installed, was wilfully destroyed by fire in 1791. In 1789 he patented a wool-combing machine, for which he took out further patents in 1790 and 1792; it effected large economies in the cost of manufacture, but its financial results were not more satisfactory to its inventor than those of the power-loom, even though in 1801 parliament extended the patent for fourteen years. In 1807 a memorial was presented to the government urging the benefits that had been conferred on the country by the power-loom, and the House of Commons voted him £10,000 in 1809. He then purchased a small farm at Holland near Sevenoaks, Kent, where he spent the rest of his life. He died at Hastings on the 30th of October 1823. Other inventions of Cartwright's included a cordelier or machine for making rope (1792), and an engine working with alcohol (1797), together with various agricultural implements.

CARTWRIGHT, JOHN (1740–1824), English parliamentary reformer, was born at Marnham in Nottinghamshire on the 17th of September 1740, being the elder brother of Edmund Cartwright, inventor of the power-loom. He was educated at Newark grammar school and Heath Academy in Yorkshire, and at the age of eighteen entered the navy. He was present, in his first year of service, at the capture of Cherbourg, and served in the following year in the action between Sir Edward Hawke and Admiral Conflans. Engaged afterwards under Sir Hugh Palliser and Admiral Byron on the Newfoundland station, he was appointed to act as chief magistrate of the settlement; and the duties of this post he discharged for five years (1765-1770). III-health necessitated his retirement from active service for a time in 1771. When the disputes with the American colonies began, he saw clearly that the colonists had right on their side, and warmly supported their cause. At the beginning of the war he was offered the appointment of first lieutenant to the duke of Cumberland, which would have put him on the path of certain promotion. But he declined to fight against the cause which he felt to be just. In 1774 he published his first plea on behalf of the colonists, entitled American Independence the Glory and Interest of Great Britain. In the following year, when the Nottinghamshire Militia was first raised, he was appointed major, and in this capacity he served for seventeen years. He was at last illegally superseded, because of his political opinions. In 1776 appeared his first work on reform in parliament, which, with the exception of Earl Stanhope's pamphlets (1774), appears to have been the earliest publication on the subject. It was entitled, Take your Choice—a second edition appearing under the new title of The Legislative Rights of the Commonalty vindicated. The task of his life was thenceforth chiefly the attainment of universal suffrage and annual parliaments. In 1778 he conceived the project of a political association, which took shape in 1780 as the "Society for Constitutional Information," including among its members some of the most distinguished men of the day. From this society sprang the more famous "Corresponding Society." Major Cartwright worked unweariedly for the promotion of reform. He was one of the witnesses on the trial of his friends, Horne Tooke, John Thelwall and Thomas Hardy, in 1794, and was himself indicted for conspiracy in 1819. He was found guilty in the following year, and was condemned to pay a fine of £100. He died in London on the 23rd of September 1824. He had married in 1780, but had no children. In 1834 a monument from a design by Macdowell was erected to him in Burton Crescent where he had lived.

The Life and Correspondence of Major Cartwright, edited by his niece F. D. Cartwright, was published in 1826.

CARTWRIGHT, PETER (1785–1872), American Methodist Episcopal preacher, was born on the 1st of September 1785 in Amherst County, Virginia. His father, a veteran of the War of Independence, took his family to Kentucky in 1790, and lived near Lancaster until 1793, and then until 1823 in Logan county near the Tennessee line. Peter received little education, and was a gambler at cards and horse-racing until 1801, when he heard John Page preach. In June he was received into the church; in May 1802 was licensed as a regular exhorter, becoming known as the "Kentucky Boy"; in the autumn of 1802 was licensed to form the Livingston circuit around the mouth of the Cumberland river; in 1806 was ordained deacon by Bishop Asbury, and in 1808 presiding elder by Bishop McKendree, under whose direction he had studied theology. He was presiding elder of the Wabash district in 1812, and of Green river district in 1813–1816, and, after four years on circuit in Kentucky and two as presiding elder of the Cumberland district, was transferred in 1823 to the Illinois conference, in which he was presiding elder of various districts until 1869. Up to 1856 he preached some 14,000 times, was paid that year £10,000, and in the church, and baptized some 12,000 persons. He died near Pleasant Plains, Sangamon county, Illinois, on the 25th of September 1872. He was a backwoods preacher, an able, vigorous speaker, and a racy writer.

See the Autobiography of Peter Cartwright, the Backwoods Preacher, edited by W. P. Strickland (New York, 1886).

CARTWRIGHT, SIR RICHARD JOHN (1835– ), Canadian statesman, was born in Kingston, Canada, on the 4th of December 1835, son of the Rev. R. D. Cartwright, chaplain to H.M. Forces. In 1863 he entered the Canadian parliament as a Conservative, but soon after federation in 1867 quarrelled with his party on the question of their financial policy, which he considered extravagant. By 1870 the breach was complete, and in 1873 he became finance minister of the Liberal ministry of the Hon. Alexander Mackenzie. His honesty and economy were undoubted, but the latter quality was sometimes pushed to extremes. From 1878 to 1896 he was the chief financial critic on the side of the Liberal opposition, and on the accession of Sir
Carus, T. W. - Carus, Marcus Aurelius

Wilfrid Laurier to power in 1896 he became minister of trade and commerce. In 1898-1899 he represented Canada on the Anglo-American joint high commission at Quebec. In 1904 failing health led to his retirement to the senate. He acted in Sir Wilfrid Laurier's absence at the Imperial Conference 1907 as acting premier.

**CARTWRIGHT, THOMAS** (c. 1535-1603), English Puritan divine, was born in Hertfordshire. He studied divinity at St John's College, Cambridge, but on Mary's accession had to leave the university, and found occupation as clerk to a counsellor-at-law. On the accession of Elizabeth, he resumed his theological studies, and was soon afterwards elected fellow of St John's and later of Trinity College. In 1564 he opposed John Preston in a theological disputation held on the occasion of Elizabeth's state visit, and in the following year helped to bring to a head the Puritan attitude on church ceremonial and organization. He was popular in Ireland as chaplain to the archbishop of Armagh (1565-1567), and in 1569 he was appointed Lady Margaret professor of divinity at Cambridge; but John Whitgift, on becoming vice-chancellor, deprived him of the post in December 1579, and he lost his fellowship in September 1580. This was a natural consequence of the course which he had taken of his position; he inveighed bitterly against the hierarchy and constitution of the Anglican Church, which he compared unfavourably with the primitive Christian organization. So keen was the struggle between him and Whitgift that the chancellor, William Cecil, had to intervene. After his deprivation by Whitgift, Cartwright visited Beza at Geneva. He returned to England in 1572, and might have become professor of Hebrew at Cambridge but for his expressed sympathy with the notorious "Admonition to the Parliament" by John Field and Thomas Wilcox. To escape arrest he again went abroad, and officiated as clergyman to the English residents at Antwerp and then at Middelburg. In 1576 he visited and organized the Huguenot churches of the Channel Islands, and after revising the Rhenish version of the New Testament, again settled as pastor at Antwerp, declining the offer of a chair at St Andrews. In 1585 he returned without permission to London, was imprisoned for a short time, and became master of the earl of Leicester's hospital at Warwick. In 1590 he was summoned before the court of high commission and imprisoned, and in 1591 he was once more committed to the Fleet. But he was not treated harshly, and powerful influence soon secured his liberation. He visited Guernsey (1595-1598), and spent his closing years in honour and prosperity at Warwick, where he died on the 27th of December 1603. Cartwright was a man of much culture and originality, but exceedingly impulsive. His views were distinctly Presbyterian, and he stoutly opposed the Brownists or Independents. He never conceived of a separation between church and state, and would probably have refused to tolerate any Nonconformity with his reformed national Presbyterian church. To him, however, the Puritanism of his day owed its systematization and much of its force.

**CARTWRIGHT, WILLIAM** (1661-1643), English dramatist and divine, the son of a country gentleman who had been reduced to keeping an inn, was born at Northway, Gloucestershire, in 1661. Anthony a Wood, whose notice of Cartwright is in the nature of a panegyric, gives this account of his origin, which is probably correct, although it is contradicted by statements made in David Lloyd's Memoirs. He was educated at the free school of Cirencester, at Westminster school, and at Christ Church, Oxford, where he took his M.A. degree in 1635. He became, says Wood, "the most florid and scheraphical preacher in the university," and appears to have been no less admired as a reader in metaphysics. In 1642 he was made successor of Salisbury cathedral, and in 1643 he was chosen junior proctor of the university. He died on the 20th of November of the same year. Cartwright was a "son" of Ben Jonson and an especial favourite with his contemporaries. The collected edition of his poems (1651) contains commemorative verses by Henry Lawes, who set some of his songs to music, by Izaak Walton, Alexander Brome, Henry Vaughan and others, and the king wore mourning on the day of his funeral. His plays are, with the exception of The Ordinary, extremely fantastic in plot, and stilted and artificial in treatment. They are: The Royal Slave (1630), produced by the students of Christ Church before the king and queen, with music by Henry Lawes; The Lady Errant (acted 1635-1636; printed, 1651); The Siege, or Love's Convert (printed 1651). In The Ordinary (1653?) he produced a comic life, in imitation of Jonson, representing pot-house society. It is reprinted in Dodwell's Old Plays (ed. Hazlitt, vol. xii).

**CARUCATE, or Caruccata (from the Med. lat. carruccata, from carruca, a wheeled plough), a measure of land, based probably on the area that could be ploughed by a team of oxen in a year; hence "carucage" means a tax levied on each "carucate" of land (see Hede).

**CARUPANO, a town and port of the state of Bermúdez, Venezuela, 65 m. N.E. of the city of Cumaná. Pop. (1908, estimate) 8000. Carupano is situated on the Caribbean coast at the opening of two valleys, and is a port of call for several regular steamship lines. Its mean annual temperature is 81° F., but the climate is healthy, because of its open situation on the coast. The country immediately behind the town is rough, but there is a considerable export of cacao, coffee, sugar, cotton, timber, and other products.

**CARUS, KARL GUSTAV** (1789-1866), German physiologist and psychologist, distinguished also as an art critic and a landscape painter, was born and educated at Leipzig. After a course in chemistry, he began the systematic study of medicine and in 1811 became a Privat docent. On the subject which he selected (comparative anatomy) no lectures had previously been given at Leipzig, and Carus soon established a reputation as a medical teacher. In the war of 1813 he was director of the military hospital at Pfaffendorf, near Leipzig, and in 1814 professor to the new medical college at Dresden, where he spent the remainder of his life. He was made royal physician in 1827, and a privy councillor in 1826. He died on the 28th of July 1860. In philosophy Carus belonged to the school of Schelling, and his works are thoroughly impregnated with the spirit of that system. He regarded inherited tendency as a proof that the cell has a certain psychic life, and pointed out that individual differences are less marked in the lower than in the higher organisms. Of his many works the most important are: Grundzüge der vergleichenden Anatomie und Physiologie (Dresden, 1828); System der Physiologie (2nd ed., 1847-1849); Psychische zur Entwicklungsgeschichte der Seele (1846, 3rd ed. Stuttgart, 1860); Physik, zur Geschichte des leiblichen Lebens (Stuttgart, 1851); Natur und Idee (Vienna, 1861); Symbolik des menschlichen Gestals (Leipzig, 1853, 2nd ed., 1857); Atlas der Kranioskopie (2nd ed. Leipzig, 1864); Vergleichende Psychologie (Vienna, 1866). See his autobiography, Lebenserinnerungen und Denkwürdigkeiten (4 vols., 1865-1866); K. von Reichenbach, Odische Erörterungen an die Herren Professoren Portlade . . . und Hofrath Carus (1865). His English and Schottland in the Jahre 1849 was translated by S. C. Davison (1846).

**CARUS, MARCUS AURELIUS**, Roman emperor a.d. 282-283, was born probably at Narbona (more correctly, Narona) in Ilyria, but was educated at Rome. He was a senator, and had filled various civil and military posts before he was appointed prefect of the praetorian guards by the emperor Probus, after whose murder at Sirmium he was proclaimed emperor by his soldiers. Although Carus severely avenged the death of Probus, he was himself suspected of having been an accessory to the deed. He does not seem to have returned to Rome after his accession, but contented himself with an announcement of the fact to the senate. Bestowing the title of Caesar upon his sons Carinus and Numerianus, he left Carinus in charge of the western portion of the empire, and took Numerianus with him on the expedition against the Persians which had been contemplated by Probus. Having defeated the Quadi and Sarmatians on the Danube, Carus proceeded through Thrace and Asia Minor, conquered Mesopotamia, pressed on to Seleucia and Ctesiphon, and carried his arms beyond the Tigris. But his hopes of further conquest were cut short by his death. One day, after a violent storm, it was announced that he was dead. His death was variously attributed to disease, the effects of lightning, or a wound.
CARVARCROL, or Cymophenol, C_{8}H_{14}OH, or

\[
\begin{align*}
\text{CH}_3 \text{OH} & \\
\text{C}_7\text{H}_8(\text{iso}) & 
\end{align*}
\]

a constituent of the ethereal oil of Origanum hirtum, oil of thyme, oil obtained from peppermint, and wild bergamot. It may be synthetically prepared by the fusion of cymol sulphonic acid with caustic potash; by the action of nitric acid on 1-methyl-2-aminoo-4-propyl benzene; by prolonged heating of 5 parts of camphor with 1 part of iodine; or by heating carvul with glacial phosphoric acid. It is extracted from Origanum oil by means of a 10% potash solution. It is a thick oil which sets at −20°C to a mass of crystals of melting point 0°C, and boiling point 236–237°C. Oxidation with ferric chloride converts it into dicarvval, whilst phosphorus pentachloride transforms it into chlorcymol.

CARVAJAL, ANTONIO FERNANDEZ (d. 1659), a Portuguese Marano (g.n.) or Crypto-Jew, who came to England in the reign of Charles I. He was the first “enzenidem” Jew in England, and by his extensive trade with the West Indies rendered considerable services to the Commonwealth. Besides his commercial value to Cromwell, Carvajal was politically useful also, for he acted as “intelligencer.” When Manasseh ben Israel in 1655 petitioned for the return of the Jews who had been expelled by Edward I, Carvajal took part in the agitation and boldly avowed his Judaism. Carvajal may be termed the founder of the Anglo-Jewish community. He died in 1659.

CARVAJAL, LUISA DE (1568–1614), Spanish missionary in England, was born at Jaraicoejo in Estremadura on the 2nd of January 1568. Her father, Don Francisco de Carvajal, was the head of an old and wealthy family which produced many men of note. Her mother, Doña Maria, belonged to the powerful house of Mendoza. Both were people of pious character. The mother died in 1572 from a fever contracted while visiting the poor, and the father took the disease from his wife, and died of it. Luisa and a brother were left to the care of their grand-aunt Maria Chacon, governor of the young children of Philip II. On her death they passed to the care of their maternal uncle, Francisco Hurtado de Mendoza, count of Almazán. The count, who was named vicerey of Navarre by Philip II., was an able public servant in whom religious zeal was carried to the point of inhuman asceticism. His niece attracted his favour by her manifest disposition to the religious life; she sent her own share of dinner to the poor, ate broken meats, wore a chain next her skin, and invited humiliation; and at the age of seventeen she was instructed by the count to make a surrender of her will to two female servants whom he set over her, and by whom she was repeatedly scourged while naked, trampled upon and otherwise ill-treated. But when Luisa came of age she refused to enter a religious house, and decided to devote herself to the conversion of England. The execution of the Jesuit emissary priest, Henry Walpole, in 1596 had moved her deeply, and she prepared herself by learning English and by the study of divinity. A lawsuit with her brother caused temporary delay, but she secured her share of the family fortune, which she devoted to founding a college for English Jesuits at Louvain; it was transferred to Watten near Saint Omer in 1612, and lasted till the suppression of the Order. In 1605 she was allowed to go to England. She established herself under the protection of the Spanish ambassador, whose house was in the Barbican. From this place of safety she carried on an active and successful propaganda. She made herself conspicuous by her attentions to the Gunpowder Plot prisoners, and won converts, partly by persuasion, partly by helping women of the very poorest class in childbirth, and taking charge of the children. Her activity attracted the attention of the authorities, and she was arrested in 1608. But the protection of the Spanish ambassador Zutigala, and the desire of King James I. to stand well with Spain, secured her release. In 1613, while staying at a house in Spitalfields, where she had in fact set up a disguised nunnery, she was arrested with all the inmates by the pursuivants of Abbot, archbishop of Canterbury, who had been on the watch for some time. Her release was again secured by the new Spanish ambassador Gondomar, who played with effect on the weakness of King James. By this time, however, the Spanish authorities had begun to discover that she was a political danger to them, and recalled her. Luisa, who had hoped for the crown of martyrdom, was bitterly disappointed, and resisted the order. Before she could be forced to obey she died in the Spanish ambassador’s house on her birthday, the 2nd of January 1614. Her body remained as an object of admiration for months till it was carried back to Spain.

The original authority for the life of Luisa de Carvajal is La Vida y Virtudes de la Venerable Virgen Doña Luisa de Carvajal y Mendoza (Madrid, 1632), by the Licentiate Lorenzo Muñoz. It is founded on her own papers collected by her English confessor Michael Walpole. It is largely autobiographical, and contains some examples of her verse. The Vida y Virtudes is summarized by Southey in his Letters from Spain and Portugal (1808). A life was written by Lady Georgiana Fullerton (1753), in which much that is shocking to modern taste is left out. The most important modern work is by La Comtesse R. de Courson (Paris, 1895). There are several references to Luisa de Carvajal in the Records of the English Province of the Society of Jesus, by Henry Foley (1877–1883). (D. H.)

CARVER, JOHN (1575–1621), one of the "Pilgrim Fathers," first governor of the Plymouth colony in America, was born, probably in Nottinghamshire, England, about 1575. Owing to religious persecution at home he took refuge in Holland about 1607, and eventually became a deacon in the church at Hertford. He resided at London with John Robinson the pastor. In 1620 he emigrated to America in the "Mayflower," and founded the Plymouth colony. Before leaving England he had probably been elected governor; after the signing of the famous "Compact," this election was confirmed; and on the 23rd of March 1620 (1621 N.S.) Carver was re-elected for the ensuing year. Early in April, however, he died from the effects of sunstroke.

CARVER, JONATHAN (c. 1725–1780), American traveller, was born probably in Canterbury, Connecticut. The date usually given for his birth, 1732, is now considered too late, since he was apparently married in 1746. In early life he followed the trade of a shoemaker and subsequently served with the provincial forces in the French and Indian wars. According to his "Journal" he conceived the idea, after the peace of 1763, of exploring Great Britain's newly acquired territory in the north-west. He is said to have set out in 1766, journeyed westward by way of the Straits of Mackinac and the Fox and Wisconsin rivers to the Mississippi, viewed the Falls of St Anthony, lived for some time among the Indians, and received from them a grant of 100 sq. m. of territory between the Missisippi and St Croix rivers. Returning east in 1768 by way of the north shore of Lake Superior he proceeded in 1769 to England, where he presented a letter of introduction to Benjamin Franklin, and made vain efforts to interest the board of trade in his investigations. In 1778 there was published in London what purported to be his own narrative of his explorations under the title of Travels through the Interior Parts of North America in the Years 1766, 1767 and 1768. It had an immediate success, was translated into French, German and Dutch, and was long generally accepted as a truthful narrative of his travels and observations, and as one of the highest authorities on the manners, customs and language of the Indians of the northern Mississippi valley. Carver died in London on the 31st of January 1780, having married a second time in England although his first wife was still living in America.

Soon after his death a new edition of the Travels was brought out by the well-known Quaker physician and author, Dr John Coakley Lettsom (1744–1815), who "edited" the work and furnished a biographical introduction. Some doubt seems to have been early entertained as to the real authorship of the
work, Oliver Wolcott in 1792 writing to Jedediah Morse, the geographer, that Carver was too unlettered to have written it, and that in his belief the book was the work of some literary hack. Careful investigation of Indian life and north-western history, notably by H. R. Schoolcraft in 1821, William H. Keating in his narrative of Major Long's Expedition (1824), and Robert Greenhow in his History of Oregon (1848), showed a remarkable similarity between the Travels and the accounts of several French authorities, but these criticisms were scarcely noticed by later writers. Finally Professor E. G. Bourne, in a paper contributed to the American Historical Review for January 1906, proved beyond dispute that the bulk of Carver's alleged narrative was merely a close paraphrase of Charlevoix's Journal, La Hontan's New Voyages to North America, and James Adair's History of the American Indians. Professor Bourne's theory is that the entire book was probably the work of the facile Dr Lettsom, whose personal relations with Carver are known to have been intimate, the "journal" alone, which constituted an inconsiderable part of the whole, having been, in part, founded on Carver's random notes and recollections. See also J. G. Godfrey, Jonathan Carver: His Travels in the North-west, 1756-1758 (No. 5 of the Parkman Club Publications, Milwaukee, Wis., 1896), and Daniel S. Durrie, "Captain Jonathan Carver of the North-west," in vol. vi. of the Wisconsin Historical Society's Collections (1875).

CARVING. To carve (A.S. cooran: connected with Gr. γαρέμω), is to cut, whatever the material; but apart from the domestic sense of carving meat, the word is more particularly associated with the art of sculpture. The name of sculptor (see SCULPTURE) is commonly reserved for the great masters of the art, especially in stone and marble, while that of carver is given to the artists or workmen who execute the subordinate decorations of architecture. The word is also specially applied to sculpture in ivory (q.v.) and its substitutes, and in wood (see WOOD-CARVING) and other soft materials (see also GEM).

CARVING AND GILDING, two allied operations which formerly were the most prominent features in the important industry of frame-making. The craftsmen who pursued the occupation were known as "carvers and gilders," and the terms still continue to be the recognized trade-name of frame-making, although very little of the ornamentation of frame-work is now accomplished by carving, and much of the so-called gilt ornament is produced without the use of gold. The trade has to do primarily with the frames of pictures, engravings and mirrors, but many of the light decorative fittings of houses, finished in "composition" and gilt work, are also entrusted to the carver and gilder. Fashion in picture frames, like all fashions, fluctuates greatly. Mouldings of the prevailing sizes and patterns are generally manufactured in special factories, and supplied in lengths to carvers and gilders ready for use. A large proportion of such mouldings, especially those of a cheaper and inferior quality, are made in Germany. What is distinctively known as a "German" moulding is a cheap imitation of gilt work made by lacquering over the surface of a white metallic base. German and English mouldings are distinguished for the richness of imitation of venner of rosewood, mahogany, walnut and other ornamental woods. The more expensive mouldings are either in wood (such as oak or mahogany), in veneers of any expensive ornamental wood, or real gilt.

A brief outline of the method of making a gilt frame, enriched with composition ornaments, may be taken as a characteristic example of the operations of the frame-maker. The foundation of such a frame is soft pine wood, in which a moulding of the required size and section is roughly run. To prevent warping the moulding is, or ought to be, made from two or more pieces of wood glued together. The moulding is "whitened up," or prepared for gilding by covering it with repeated coatings of a mixture of finely powdered whiting and size. When a sufficient thickness of the whitening mixture has been applied, the whole surface is carefully smoothed off with pumice-stone and glass-paper, care being taken to keep the angles and curves clear and sharp. Were a plain gilt moulding only desired, it would now be ready for gilding; but when the frame is to be enriched it first receives the composition ornaments. Composition, or "compo," is a mixture of fine glue, white resin, and linseed oil well boiled together, with as much rolled and sifted whiting added as makes the whole into a doughy mass while hot. This composition is worked in a hot state into moulds of boxwood, and so pressed in as to take up every ornamental detail. On its removal from the mould all superfluous matter is trimmed away, and the ornament, while yet soft and plastic, is laid on the moulding, and fitting into all the curves, &c., is fixed with glue. The ornamental surface so prepared quickly sets and becomes very hard and brittle. When very large bold ornaments are wanted for frames of unusual size they are moulded in papiér mâché. Two methods of laying on—oil-gilding and water-gilding—are practised, the former being used for frames broken up with enrichments. For oil-gilding the moulding is prepared with two coats of fine thin size to fill the pores of the wood, and afterwards it receives a coat of oil gold-size, which consists of a mixture of boiled linseed oil and ochre. When this gold-size is in a "tacky" or "sticky" condition, gold-leaf is laid on and carefully pressed over and into all parts of the surface; and when covered with a coat of finish-size the gilding is complete. Water-gilding is applied to plain mouldings and all considerable unbroken surfaces, and is finished either "matt" or burnished. For these styles of work the mouldings are properly sized, and after the size (which for "matt" is red in colour and for burnish blue) is dry the gold is laid on with water. Matt-work is protected with one or two coats of finish-size; but burnished gold is finished only by polishing with an agate burnisher—no size or water being allowed to touch such surfaces. The mitring up of frames, the mounting and fitting up of paintings, engravings, &c., involve too many minor operations to be noticed here in detail; but these, with the cutting and fitting of glass, cleaning and repairing pictures and prints, and similar operations, all occupy the attention of the carver and gilder.

CARY, ALICE (1826-1872), and PHOEBE (1824-1857), American poets, were born at Mount Healthy, near Cincinnati, Ohio, respectively on the 26th of April 1826 and the 4th of September 1824. Their education was largely self-acquired, and their work in literature was always done in unbroken companionship. Their poems were first collected in a volume entitled Poems of Alice and Phoebe Carey [sic] (1850). In 1850-1851 they removed to New York, where the two sisters, befriended by Rufus W. Griswold (1815-1857), the quesi-dictator of American verse, and Horace Greeley, occupied a prominent position in literary circles. In 1868-1869 Alice Cary served for a short time as the first president of Sorosis, the first woman's club organized in New York. Alice, who was much the more voluble writer of the two, wrote prose sketches and novels, now almost forgotten, and various volumes of verse, notably The Lover's Diary (1868). Her lyrical poem, Pictures of Memory, was much admired by Edgar Allan Poe. Phoebe published two volumes of poems (1854 and 1868), but is best known as the author of the well-known "Nearer Home, beginning." One sweetly "thought" which Alice Cary left us is, "All through the New York City on the 12th of February 1871, and Phoebe in Newport, Rhode Island, on the 31st of July of the same year. The collected Poetical Works of Alice and Phoebe Cary were published in Boston in 1886.

See Mrs Mary Clemmer Ames's Memorial of Alice and Phoebe Cary (New York, 1875).
CARYATIDES—CARYOPHYLLACEAE

and at Christ Church, Oxford, which he entered in 1792. He took holy orders, and was presented in 1797 to the vicarage of Abbott's Bromley in Staffordshire. This benefice he held till his death. In 1800 he was also presented to the vicarage of Kingsbury in Warwickshire. While still at school he had become a regular contributor to the Gentleman's Magazine, and had published a volume of Sonnets and Odes. At Christ Church he devoted much time to the study of French and Italian literature; and the fruits of these studies appeared in the notes to his classic translation of Dante. The version of the Inferno was published in 1805, together with the original text. Soon afterwards Cary moved to London, where he became reader at Berkeley chapel, and subsequently lecturer at Chiswick and curate of the Savoy.

His version of the whole Divina Commedia did not appear till 1814. It was published at Cary's own expense, as the publisher refused to undertake the risk, owing to the failure incurred over the Inferno. The translation was brought to the notice of Samuel Rogers by Thomas Moore. Rogers made some additions to an article on it by Ugo Foscolo in the Edinburgh Review. This article, and praise bestowed on the work by Coleridge in a lecture at the Royal Institution, led to a general acknowledgment of its merit. Cary's Dante thus gradually took its place among standard works, passing through four editions in the translator's lifetime. It has the great merits of accuracy, idiomatic vigour and readability; it preserves the sincerity and vividness of the original; and, although many rivals have since appeared in the field, it still holds an honourable place. Its blank verse, however, cannot represent the close woven texture and the stately music of the terza rima of the original. In 1824 Cary published a translation of The Birds of Aristophanes, and, about 1834, of the Odes of Pindar. In 1826 he was appointed assistant-librarian in the British Museum, a post which he held for about eleven years. He resigned because the appointment of keeper of the printed books, which should have been his in the ordinary course of promotion, was refused him when it fell vacant. In 1841 a crown pension of £200 a year, obtained through the efforts of Samuel Rogers, was conferred on him. Cary's Lives of the early French Poets, and Lives of English Poets (from Johnson to Henry Kirke White), intended as a continuation of Johnson's Lives of the Poets, were published in a collected form in 1846. He died in London on the 14th of August 1844, and was buried in Westminster Abbey.

A memoir was published by his son, Henry Cary, in 1847.

CARYATIDES (Latinized from the Greek, i.e. a woman of Caryae in Laconia), in architecture, the term given to the draped female figures used for piers or supports, as found in the porticos of the Erechtheum and of the Treasury of Cnidas at Delphi (see Greek Art, fig. 17).

CARYL, JOSEPH (1602–1773), English Nonconformist divine, was born in London in 1602. He graduated at Exeter College, Oxford, and became preacher at Lincoln's Inn. He frequently preached before the Long Parliament, and was a member of the Westminster Assembly in 1643. By order of the parliament he attended Charles I. in Holmby House, and in 1650 he was sent with John Owen to accompany Cromwell to Scotland. In 1662 he was ejected from his church of St Magnus near London Bridge, but continued to minister to an Independent congregation in London till his death in March 1673, when John Owen succeeded him. His piety and learning are displayed in his ponderous commentary on Job (12 vols., 4to, 1657–1666; 2nd ed., 2 vols., fol. 1676–1677).

CARYOPHYLLACEAE, a botanical order of dicotyledonous plants, containing about 60 genera with 1300 species, and widely distributed, especially in temperate, alpine and arctic regions. The plants are herbs, sometimes becoming shrubby at the base, with opposite, simple, generally uncut leaves and swollen nodes. The main axis ends in a definite inflorescence, and flower-bearing branches are borne one on each side by which the branching is often continued (known technically as a dichasial cyme). The flowers are regular, with four or five sepals which are free or joined to form a tube in their lower portion, the same number of petals, free and springing from below the ovary, twice as many stamens, inserted with the petals, and a pistil of two to five carpels joined to form an ovary containing a large number of ovules on a central placenta and bearing two to five styles; the ovary is one-celled or incompletely partitioned at the base into three to five cells; honey is secreted at the base of the stamens. The fruit is a capsule containing a large number of small seeds and opening by apical teeth; the seed contains a floury endosperm and a curved embryo.

The order is divided into two well-defined tribes which are distinguished by the character of the flower and the arrangements for ensuring pollination.

Tribe I. Alsineae: the sepals are free and the flowers are open, with spreading petals, and the honey which is secreted at the base of the stamens is exposed to the visits of short-tongued...
insects, such as flies and small bees; the petals are white in color. It includes several British genera, *Cerastium* (mouse-ear chickweed), *Stellaria* (fig. 1) (*stichwort* and chickweed), * Arenaria* (sandwort), * Sagina* (pallwort), * Spargula* (spurrey) and * Spergularia* (sandwort spurrey).

Tribe II. Sileneae: the sepals are joined below to form a narrow tube, in which stand the long claws of the petals and the stamens, partly closing the tube and rendering the honey in-accessible to all but long-tongued insects such as the larger bees and Lepidoptera. The flowers are often red. It includes several British genera.— *Dianthus* (pink) fig. 2, *Silene* (catchfly, bladder campion), * Lychnis* (campion, L. *Floso-Cuculi* is ragged robin), and * Githago* or * Agrostemma* (corn campion). Several, such as *LYCHNIAS Vesperis*, *Silene Leucomantes* and others, are night-flowering, opening their flowers and becoming scented in the evening or at night, when they are visited by night-flying moths.

The plants of this order are of little or no economic value, soap-wort, *Saponaria officinalis*, forming a lather in water was formerly official. *Dianthus* (carnation and pink) *Gypsophila*, *Lychnis* and others, are garden plants.

**CASABIANCA, RAPHAEL, COMTE DE** (1738-1825), French general, was descended from a noble Corsican family. In 1789 he took the side of France against Genoa, then mistress of the island. In 1793, having entered the service of the revolutionary government, he was appointed lieutenant-general in Corsica in place of Pascale Paoli, who was outlawed for intrigues with England. For his defence of Calvi against the English he was appointed general of division, and he served in Italy from 1794 to 1798. After the 18th of Brumaire he entered the senate and was made count of the empire in 1806. In 1814 he joined the party of Louis XVIII., rejoined Napoleon during the Hundred Days, and in 1819 succeeded again in entering the chamber of peers.

His nephew, **LOUIS DE CASABIANCA** (1762-1768), entered the French navy, served in the convoy of the French troops sent to aid the revolting American colonies, and took part in various naval actions off the North American coast. He became captain in 1792, represented Corsica in the Convention, and then received command of the *Orion*, which at the battle of the Nile bore the flag of Admiral Brueys. When the latter was killed, Casabianca, though badly wounded, fought the burning ship to the end, and perished with most of the crew. His son, Giacomo Jocante, a boy of ten years of age, refused to leave the ship and died in trying to save his father. This heroic act was the subject of several poems, including the well-known ballad by Mrs. Hemans.

**CASABLANCA** (Dar el Baida, "the white house ") is a seaport on the Atlantic coast of Morocco, in 33° 27' N., 7° 46' W. It is a wool and grain port for central Morocco, chiefly for the provinces of Tadla and Shawia. Third in importance of the towns on the Moorish coast, unimpeded by bar or serious rocks, the roadstead is exposed to the north-west winds. There is anchorage for steamers in 5 to 6 fathoms. Vessels were loaded and discharged by lighters from the beach. In May 1900 the construction began of harbour works which afforded sheltered accommodation for ships at all states of the tide. The value of the foreign trade of the port for the period 1897-1907 was about £750,000 a year. A railway to Ber Rezhid, the first section of a line intended to tap the rich agricultural region of which Casablanca is the port, was opened in September 1908, being the first railway built in Morocco. The population, about 20,000, includes numerous foreign merchants, Franciscan and Protestant missions, and a consular corps. Built by the Portuguese upon the site of the once prosperous town of Anfa, which they had destroyed in 1468, Casablanca was held by them for some time, till trouble with the natives compelled them to abandon it. In August 1907, in consequence of the murder of a number of French and Spanish workmen engaged on the harbour works, the town was bombarded and occupied by the French (see MOROCCO: History).

**CASELE MONFERRAT**, a town and episcopal see of Piedmont, Italy, in the province of Alessandria, 21 m. N.N.W. by rail from the town of Alessandria. Pop. (1901) 18,874 (town); 31,370 (commune). It lies in the plain on the right bank of the Po, 377 ft. above sea-level, and is a junction for Mortara, Vercelli, Chivasso and Asti; it is also connected by steam tramways with Alessandria, Vercelli and Montemagno. The fine Lombard Romanesque cathedral, originally founded in 742, was rebuilt in the early 12th century and consecrated in 1106; it suffered from restoration in 1706, but has been brought back to its original form. It contains some good pictures. The church of S. Domenico is a good Renaissance edifice, and there are some fine palaces. The church of S. Ilario is said to occupy the site of a pagan temple, but the name of the ancient town (if any) which occupied this site is not known. About 10 m. distant is the Sacro Monte di Crea, consisting of eight houses, each of which contains a set of statues and containing terra-cotta groups of statues, resembling those at Varallo. Casele Monferrato was given by Charlemagne to the church of Vercelli, but obtained its liberty from Frederick I. (Barbarossa). It was sacked by the troops of Vercelli, Alessandria and Milan in 1215, but rebuilt and fortified in 1220. It fell under the power of its marquises in 1292, and became the chief town of a small state. In 1536 it passed to the Gonzagas of Mantua, who fortified it very strongly. It has since been of considerable importance as a fortress: it successfully resisted the Austrians in 1849, and was strengthened in 1852. There is a large Portland cement factory here.

**CASAMARI**, a Cistercian abbey in the province of Rome, 6 m. E.S.E. of Veroli. It marks the site of Cereatae, the birth-place of Marius, afterwards known, as inscriptions attest, as Cereatae Marianae, having been separated perhaps by the triumvir, from the territory of Arpinum. We find it under the early empire as an independent community. The abbey is a fine example of Burgundian early-Gothic (1203-1217), paralleled in Italy by Fossannuno alone (which is almost contemporaneous). See C. Enlart, "Origines francaises de l'architecture gothique en Italie." (Bibliotheque des ecles frangaises d'Itali et de Rome, fasc. 66). (Paris, 1894).

**CASANOVA DE SEINGALT, GIOVANNI JACOPO** (1725-1790), Italian adventurer, was born at Venice in 1725. His father belonged to an ancient and even noble family, but alienated his friends by embracing the dramatic profession early in life. He made a runaway marriage with Zanetta Farusi, the beautiful daughter of a Venetian shoemaker; and Giovanni was their eldest child. When he was but a year old, his parents, taking a journey to London, left him in charge of his grandmother, who, perceiving his precocious and lively intellect, had him educated far above her means. At sixteen he passed his examination and entered the seminary of St Cyprian in Venice, from which he was expelled a short time afterwards for some scandalous and immoral conduct, which would have cost him his liberty, had not his mother managed somehow to procure him a situation in the household of the Cardinal Acquaviva. He made but a short stay, however, in that prelate's establishment, all restraint being irksome to his wayward disposition, and took to travelling. Then began that existence of adventure and intrigue which only ended with his death. He visited Rome, Naples, Corfu and Constantinople. By turns journalist, preacher, abbé, diplomatist, he was nothing very long, except homme a bonnes fortunes, which profession he cultivated till the end of his days. In 1755, having returned to Venice, he was denounced as a spy and imprisoned. On the 1st of November 1756 he
succeeded in escaping, and made his way to Paris. Here he was made director of the state lotteries, gained much financial reputation and a considerable fortune, and frequented the society of the most notable French men and women of the day.

In 1759 he set out again on his travels. He visited in turn the Netherlands, South Germany, Switzerland—where he made the acquaintance of Voltaire,—Savoy, southern France, Florence—whence he was expelled,—and Rome, where the pope gave him the order of the Golden Spar. In 1761 he returned to Paris, and for the next four or five years lived partly here, partly in England, South Germany and Italy. In 1764 he was in Berlin, where he refused the offer of a post made him by Frederick II. He then travelled by way of Riga and St Petersburg to Warsaw, where he was favourably received by King Stanislaus Poniatowski. A scandal, followed by a duell, forced him to flee, and he returned by a deviouse route to Paris, only to find a lettre de cachet awaiting him, which drove him to seek refuge in Spain. Expelled from Madrid in 1769, he went by way of Aix—where he met Cugliastro—to Italy once more. From 1774, with which year his memoirs close, he was a police spy in the service of the Venetian inquisitors of state; but in 1782, in consequence of a satirical libel on one of his patrician patrons, he had once more to go into exile. In 1785 he was appointed by Count Waldstein, an old Paris acquaintance, his librarian at the château of Dux in Bohemia. Here he lived until his death, which probably occurred on the 4th of June 1798.

The main authority for Casanova’s life is his Mémoires (12 vols., Leipzig, 1826–1838; later ed. in 8 vols., Paris, 1885), which were written at Dux. They are clear, well written and, above all, cynical, and interesting as a trustworthy picture of the manners and mores of the times. Among Casanova’s other works may be mentioned Confallation della storia del governo Venezia d’Amelot de la Houve (Amsterdam, 1769), an attempt to ingratiate himself with the Venetian government; and the Histoire de son escape from prison (Leipzig, 1788; reprinted Bordeaux, 1884; Eng. trans. by P. Villars, 1892). Ottmann’s Jacob Casanova (Stuttgart, 1900) contains a bibliography.

**CASAS GRANDES — CASAUBON**

CASAS GRANDES ("Great Houses"), a small village of Mexico, in the state of Chihuahua, situated on the Casas Grandes or San Miguel river, about 35 m. S. of Llanos and 150 m. N.W. of the city of Chihuahua. The railway from Ciudad Juárez to Terrañas passes through the town. It is celebrated for the ruins of excavations which buildings still exist, about half a mile from its present site. They are built of "sun-dried bricks, made of mud and gravel, about 22 in. thick, and of irregular length, generally about 3 ft., probably formed and dried in situ." The walls are in some places about 5 ft. thick, and they seem to have been plastered both inside and outside. The principal edifice extends 800 ft. from north to south, and 250 ft. east to west; its general outline is rectangular, and it appears to have consisted of three separate piles united by galleries or lines of lower buildings. The exact plan of the whole is obscure, but the apartments evidently varied in size from mere closets to extensive courts. The walls still stand at many of the angles with a height of from 40 to 50 ft., and indicate an original elevation of several storeys, perhaps six or seven. At a distance of about 450 ft. from the main building are the substructions of a smaller edifice, consisting of a series of rooms and courts, with a central square court, so that there are seven to each side besides a large apartment. The age of these buildings is unknown, as they were already in ruins at the time of the Spanish Conquest. The whole district of Casas Grandes is further studded with artificial mounds, from which are excavated from time to time large numbers of stone axes, metates or corn-grinders, and earthen vessels of various kinds. These last have a white or reddish ground, with ornamentation in blue, red, brown or black, and are of much better manufacture than the modern pottery of the country. Similar ruins to those of Casas Grandes exist near the Gila, the Salinas, and the Colorado and it is probable that they are all the erections of one people. Bancroft is disposed to assign them to the Moquis.

See vol. iv. of H. H. Bancroft’s The Native Races of the Pacific States of North America, of which the principal authorities are the Noticias del Estado de Chihuahua of Escudero, who visited the place and in 1819; an article in the first volume of the Album Mexicano, the author of which was at Casas Grandes in 1842; and the Personal Narrative of Explorations and Incidents in Texas, New Mexico, California, Sonora and Chihuahua (1854), by John Russell Bartlett, who explored the locality in 1851.

**CASAUBON, FLORENCE ESTENNE MÉRIC** (1599–1671), English classical scholar, son of Isaac Casaubon, was born at Geneva on the 14th of August 1599. At an early age he joined his father in England, and completed his education at Eton and Oxford (B.A. 1618). His defence of his father against the attacks of certain Catholics (Pietas contra maedidos patrii Nominis et Religionis Hostes, 1621), secured him the notice and favour of James I, who conferred upon him a prebendal stall in Canterbury cathedral. He also vindicated his father’s literary reputation against certain impostors who had published, under his name, a work on The Origin of Idolatry (Vindicatio Parisi adversus Impostores, 1624). During the Civil War he lived a retired life, and after its conclusion refused to acknowledge the authority of Cromwell, who, notwithstanding, requested him to write an "impartial" history of the events of the period. In spite of the tempting inducements held out, he declined, and also refused the post of inspector of the Swedish universities offered him by Queen Christina. After the Restoration, he was reinstated in his benefice, and devoted the rest of his life to literary work. He died at Canterbury on the 14th of July 1671. Méric Casaubon’s reputation was overshadowed by that of his father; but his editions of numerous classical authors, and especially of the Meditations of Marcus Aurelius (also English translation, new ed. by W. H. D. Rowe, 1800), were highly valued. Among his other works may be mentioned: De Quatuor Linguis Commentatia (1630), De l’Necessité de la Réformation (1664), On Credulity and Incredulity in Things natural, civil and divine (1668).

**CASAUBON, ISAAC** (1559–1614), French (naturalized English) classical scholar, was born at Geneva, on the 18th of February 1559, of French refugee parents. On the publication of the edict of January 1562, the family returned to France and settled at Crest in Dauphiné, where Arnaud Casaubon, Isaac’s father, became minister of a Huguenot congregation. Till he was nineteen, Isaac had no other instruction than what could be given him by his father during the years of civil war. Arnaud was away from home whole years together in the Calvinist camp, or the family were flying to the hills to hide from the fanatical bands of armed Catholics who patrolled the country. Thus it was in a cave in the mountains of Dauphiné, after the massacre of St Bartholomew, that Isaac received his first lesson in Greek, the text-book being Isocrates ad Democritum.

At nineteen Isaac was sent to the Academy of Geneva, where he read Greek under Francis Portus, a native of Crete. Portus died in 1581, having recommended Casaubon, then only twenty-two, as his successor. At Geneva he remained as professor of Greek till 1596. Here he married twice, his second wife being Catherine, daughter of the scholar-printer, Henri Estienne. Here, without the stimulus of example or encouragement, with few books and no assistance, in a city peopled with religious refugees, and struggling for life against the troops of the Catholic dukes of Savoy, Casaubon made himself a consummate Greek scholar and master of ancient learning. His great wants at Geneva were books and the sympathy of learned associates. He spent all he could save out of his small salary in buying books, and in having copies made of such classics as were not then in print. Henri Estienne, Théodore de Beza (rector of the university and professor of theology), and Jacques Lect (Lectius), were indeed men of superior learning. But Henri, in those last years of his life, was no longer the Estienne of the Thesaurus; he was never at home, and would not suffer his son-in-law to enter his library. "He guards his books," writes Casaubon, "as the griffins in India do their gold!" Beza was engaged by the cares of administration, and retained, at most, an interest for theoreetical reading, while Lect, a lawyer and diplomatist, had left classics for the active business of the council. The sympathy and help which Casaubon’s native city could not afford him, he endeavoured to supply by cultivating the acquaintance of the learned of other countries. Geneva, as the
The issue was so contrived that the Protestant party could not but be pronounced to be in the wrong. By concurring in the decision, which was unfavourable to Du Plessis Mornay, Casaubon lent the prestige of his name to a court verdict which would have been worthless, and confirmed the suspicions already current among the Reformed churches that, like his friend and patron, Canaye du Fresne, he was mediating abjuration.

From this time forward he became the object of the hopes and fears of the two religious parties; the Catholics lavishing promises, and plying him with arguments; the Reformed ministers insinuating that he was preparing to forsake a losing cause, and only haggling about his price. We now know enough of Casaubon's mental history to know how erroneous were these computations of his motives. But, at the time, it was not possible for the immediate parties to the bitter controversy to understand the intermediate position between Genevan Calvinism and Ultramontanism to which Casaubon's reading of the fathers had conducted him.

Meantime the efforts of De Thou and the liberal Catholics to retain him in Paris were successful. The king repeated his invitation to Casaubon to settle in the capital, and assigned him a pension. No more was said about the university. The recent reform of the university of Paris had closed its doors to all but Catholics; and though the chairs of the Collège de France were not governed by the statutes of the university, public opinion was so powerful and Henry IV. dared not appoint a Calvinist to a chair, even if he had desired to do so. It was designed that Casaubon should succeed to the post of sub-librarian of the royal library when it should become vacant, and a patent of the reversion was made out in his favour. In November 1604, Jean Gosselin died in extreme old age; and Casaubon succeeded him as sub-librarian, with a salary of 400 livres in addition to his pension.

In Paris Casaubon remained till 1610. These ten years were the brightest period of his life. He had attained the reputation of being, after Scaliger, the most learned man of the age,—an age in which learning formed the sole standard of literary merit. He was placed above penury, though not in easy circumstances. He had such facilities for religious worship as a Huguenot could have, though he had to go out of the city to Hablon, and afterwards to Charton, for them. He enjoyed the society of men of learning, or of men who took an interest in learned publications. He had the best opportunities of seeing men of letters from foreign countries as they passed through Paris. Above all, he had ample facilities for using Greek books, both printed and in MS., the want of which he had felt painfully at Geneva and Montpellier, and which no other place but Paris could at that period have supplied.

In spite of all these advantages we find Casaubon restless, and ever framing schemes for leaving Paris, and settling elsewhere. It was known that he was open to offers, and offers came to him from various quarters,—from Nimes, from Heidelberg, from Sedan. His friends Lect and Giovanni Diodati wished, rather than hoped, to get him back to Geneva. The causes of Casaubon's discomfort in Paris were various, but the principal source of uneasiness lay in his religion. The life of any Huguenot in Paris was hardly secure at that time, for it was doubtful if the police of the city was strong enough to protect them against any sudden uprising of the fanatical mob, always ready to re-enact the St. Bartholomew. But Casaubon was exposed to persecution of another sort. Ever since the Fontainebleau Conference an impression prevailed that he was wavering. It was known that he rejected the outre anti-popery opinions current in the Reformed churches; that he read the fathers, and wished for a church after the pattern of the primitive ages. He was given to understand that he could have a professorship only by recantation. When it was found that he could not be bought, he was plied by controversy. Henry IV., who liked Casaubon personally, made a point of getting him to follow his own example. By the king's orders Duperron was uniting in his efforts to convert him. Casaubon's knowledge of the fathers was that of a scholar, Duperron's that of an adroit polemist; and the
scolar was driven to admit that the polemist was often too hard for him. These encounters mostly took place in the king’s library, over which the cardinal, in his capacity of aumonier, exercised some kind of authority; and it was therefore impossible for Casaubon to avoid them. On the other hand, the Huguenot theologians, and especially Pierre du Moulin, chief pastor of the church of Paris, accused him of conceding too much, and of having departed already from the lines of strict Calvinistic orthodoxy.

When the assassination of Henry IV. gave full rein to the Ultramontane party at court, the obsessions of Duperron became more importunate, and even menacing. It was now that Casaubon began to listen to overtures which had been faintly made before, from the bishops and the court of England. In October 1610 he came to England in the suite of the ambassador, Lord Wotton of Marley (brother of Casaubon’s early friend), an official invitation having been sent him by Richard Bancroft, archbishop of Canterbury. He had the most flattering reception from James I., who was perpetually sending for him to discuss theological matters. The English bishops were equally delighted to find that the great French scholar was an Anglican ready made, who had arrived, by independent study of the Fathers, at the very via media between Papism and Protestantism; and was becoming the fashion in the English Church. Casaubon, though layman, was collated to a prebendal stall in Canterbury, and a pension of £300 a year was assigned him from the exchequer. Nor were these merely paper figures. When Sir Julius Caesar made a difficulty about payment, James sent a note in his own hand: “Chancellor of my exchequer, I will have Mr. Casaubon paid before me, my wife, and my barns.” He still retained his appointments in France, and his office as librarian. He had obtained leave of absence for a visit to England, where his permanent settlement was not contemplated. In order to retain their hold upon him, the government of the queen regent refused to allow his library to be sent over. It required a special request from James himself to get leave for Madame Casaubon to bring him a part of his most necessary books. Casaubon continued to speak of himself as the servant of the regent, and to declare his readiness to return when summoned to do so.

Meanwhile his situation in London gradually developed unforeseen sources of discomfort. Not that he had any reason to complain of his patrons, the king and the bishops. James continued to the last to delight in his company, and to be as liberal as the state of his finances allowed. John Owen, who had received him and his whole family into the deanship of St. Paul’s, entertained him there for a year. Overall and Lancelot Andreasons, then bishop of Ely, were the most learned men of a generation in which extensive reading was more general among the higher clergy than it has ever been since. These two were attracted to Casaubon by congenial studies and opinions. With the witty and learned bishop of Ely in particular Casaubon was always happy to spend such hours as he had to spare from the labours of the study. Andrewes took him to Cambridge, where he met with a most gratifying reception from the notabilities of the university. They went on together to Downham, where Casaubon spent six weeks of the summer of 1611, in which year he became naturalized. In 1613 he was taken to Oxford by Sir Henry Savile, where, amid the homage and feasting of which he was the object, his principal interest was for the MSS. treasures of the Bodleian. The honorary degree which was offered him he declined.

But these distinctions were far from compensating the serious inconveniences of his position. Having been taken up by the king and the bishops, he had to share in their rising unpopularity. The cardinals looked with a jealous eye on a person who enjoyed frequent opportunities of taking James I. on his weak side—his love of book-talk—opportunities which they would have known how to use. Casaubon was especially mortified by Sir Henry Wotton’s persistent avoidance of him, so inconsistent with their former intimacy. His windows were broken by the roughs at night, his children pelted in the streets by day. On one occasion he himself appeared at Theobalds with a black eye, having received a blow from some ruffian’s fist in the street. The historian Hallam thinks that he had “become personally unpopular”; but these outrages from the vulgar seem to have arisen solely from the cockney’s antipathy to the Frenchman. Casaubon, though he could make shift to read an English book, could not speak English, any more than Mme Casaubon. This deficiency not only exposed him to insult and fraud, but restricted his social intercourse. He excluded him altogether from the circle of the “wits”; either this or some other cause prevented him from being acceptable in the circle of the lay learned—the “antiquaries.” William Camden, the antiquary and historian, he saw but once or twice. Casaubon had been imprudent enough to correct Camden’s Greek, and it is possible that the ex-headmaster of Westminster kept himself aloof in silent resentment of Casaubon’s superior learning. With Robert Cotton and Henry Spelman he was slightly acquainted. Of John Selden we find no mention. Though Sir Henry Savile ostensively patronized him, yet Casaubon could not help suspecting that it was Savile who secretly prompted an attempt by Richard Montagu to forestall Casaubon’s book on Baronius. Besides the jealousy of the natives, Casaubon had now to suffer the open attacks of the Jesuit pamphleteers. They had spared him as long as there were hopes of getting their own back. The prohibition was taken off, but only too late. Only Joannes Eudaimon, Heribert Roswey and Schoppius (Gaspar Schoppe), but a respectable writer, friendly to Casaubon, Andreas Schott of Antwerp, gave currency to the insinuation that Casaubon had sold his conscience for English gold.

But the most serious cause of discomfort in his English residence was that his time was no longer his own. He was perpetually being summoned out of town to one or other of James’s hunting residences that the king might enjoy his talk. He had come over from Paris in search of leisure, and found that a new claim on his time was established. The king and the bishops wanted to employ his pen in their literary warfare against Rome. They compelled him to write first one, then a second, pamphlet on the subject of the day,—the royal supremacy. At last, ashamed of thus misappropriating Casaubon’s stores of learning, they set him upon a refutation of the Annales of Baronius, then in the full tide of its credit and success. Upon this task Casaubon spent his remaining strength and life. He died in great suffering on the 1st of July 1614. His complaint was an organic and congenital malformation of the bladder; but his end was hastened by an unhealthy life of over-study, and latterly by his anxiety to acquire himself creditably in his criticism on Baronius.

His reputation is, to a large extent, a matter of family tradition. His monument by which his name is there commemorated was erected in 1652 by his friend Thomas Morton when bishop of Durham.

Besides the editions of ancient authors which have been mentioned, Casaubon published with commentaries Persius, Suetonius, the Scriptores Historiae Augustae. The edition of Polybius, on which he had spent vast labour, he left unfinished. His most ambitious work was his revision of the text of the Deipnosophistae of Athenaeus, with commentary. The Theophrastus perhaps exhibits his most characteristic excellences as a commentator. The Exercitationes in Baronium are but a fragment of the massive criticism which he contemplated; it failed in bringing before the reader the uncritical character of Baronius’s history, and had only a moderate success, even among the Protestants. His correspondence (in Latin) was finally collected by Van Almeloven (Rotterdam, 1709), who prefixed to the letters a careful life of Isaac Casaubon. But this learned Dutch editor was acquainted with Casaubon’s diary only in extract. This diary, Ephebemides, of which the MS. is preserved in the chapter library of Canterbury, was printed in 1850 by the Clarendon Press. It forms the most valuable record of a possession of the daily life of a scholar, or man of letters, of the 16th century. (M. P.)

A few minor changes have been made in the above article, compared with its form in the 9th edition. The most complete account

1 Eudaimon was a Cretan, Roswey a Dutch, Jesuit; Schoppe, a German philologyst and critic.
CASCADE MOUNTAINS—CASERTA

of Casaubon is the full biography by Mark Pattison (1875), of which a second and revised edition, by H. Nettlethorpe, was published in 1892; the most recent work on the subject is Isaac Casaubon, sa vie et son temps, by L. J. Nazelle (1887); there is a monograph on the Fontainebleau conference by J. A. Lalet (1889). Casaubon is the subject of one of St Beuve's Caverœurs, the 30th of July 1860 (a notice of the Oxford edition of the Ephemerides). See also the article in E. Haag's La France Protestante (1882), and J. E. Sandys, Hist. of Class. Schol. vol. ii. (ed. 1908), pp. 204 foll.

CASCADE MOUNTAINS, a continuation northward of the Sierra Nevada, some 500 m. across the states of Oregon and Washington, U.S.A., into British Columbia. In American territory the range lies from 100 to 150 m. from the coast. The Cascades are separated on the S. from the Sierras by deep valleys near Mt. Shasta in California, while on the N., somewhat below the continental international boundary of 40° N., they approach the northern Rockies, mingling with these in inextricable confusion, although their name is given also to the much-broken, river-dissected, central mountain plateau that crosses British Columbia from S.E. to N.W. Geologically the Sierras and Cascades are very different, though their exact relations are not yet clearly determined; topographically they are also different. The Cascades are in general a comparatively low, broad mass surmounted by a number of imposing peaks in Oregon and Washington. Early by the Columbia river, the range widens out into a plateau. These are not permanent glaciers in British Columbia. Evidences of volcanic activity in comparatively recent geologic time are abundant throughout the length of the range, and all the highest summits are volcanic cones, covered with snow fields and, in a number of instances, with glaciers. The grandest peaks are Shasta (14,380 ft.) at the southern end, and Rainier (or Tacoma, 14,536 ft.) in Washington, two of the most magnificent mountains of America. Other notable summits are Mt. Pitt (9760), Mt. Scott (9122), Diamond Peak (8807), Mt. Thielsen (9290), Mt. Jefferson (10,200) and Mt. Hood (11,225), in Oregon; and Stuart (9470), St Helens (10,000), Baker (10,827) and Adams (12,470), in Washington. The Fraser river in the far north, the Columbia at the middle, and the Klamath in the south cut athwart the range to the Pacific, and many minor streams descend the range to swell their waters, while some drain directly from the flanks of the mountains into Puget Sound and Gray's Harbor. The Columbia has cut almost to the sea-level through the great mountain mass, the Dalles being only about 100 ft. above the sea. It is to the Cascades of the tremendous rapids at this point that the mountains owe their magnificent aspect. Though the slopes of the Cascades, particularly on the west, which has a very much moister climate than the eastern slope, are clothed with magnificent forests, chiefly of coniferous evergreens: fir, pine, tamarack and cedar. The Douglas fir, the "Oregon pine" of commerce, often attaining a height of 250 ft., is one of the most beautiful trees in the world. There are also a variety of deciduous trees, but in the aggregate they are unimportant. In 1910 the mountain forests were largely included in ten national forest reserves, with a total area of nearly 16,000,000 acres, extending from the northern boundary of Washington to the southern boundary of Oregon. The magnificent forest cloak, splendid peaks, great open mountain plateau pastures, and exquisite lakes embosomed in mountain fastnesses and forest gloom, give variety to the scenery, which is often grand, and throughout the range indescribably beautiful, though perhaps not equal to the Sierra Nevada in splendid light and colour. Large game—deer, bears, mountain sheep and goats, wolves and panthers—still abound. Two great railway systems, the Great Northern and the Northern Pacific, cross the Cascades through noteworthy tunnels; that on the former line is 23½ m. long, that on the latter a little less than 2 m.

CASE, JOHN (d. 1600), English Aristotelian scholar and physician, was born at Woodstock. He was educated at Oxford, and elected to a fellowship at St John's College, which he was obliged to resign in consequence of his Roman Catholic sympathies. He subsequently opened a philosophical school in Oxford, which was largely attended. He enjoyed a great reputation as a logician and dialectician, and was in addition an authority on music and a distinguished physician. He is described as "a man of an innocent, meek, religious and studious life," an agreeable conversationalist, an enthusiastic teacher, and a great favourite with his pupils. Most of his works were commentaries on various treatises of Aristotle (Organon, Ethics, Politics, Oeconomies, Physics) under curious titles; they enjoyed a large circulation during his time, and were frequently reprinted. He was also the author of The Praise of Musique (1586), dedicated to Sir Walter Raleigh.

CASE. (1) (From Lat. casus, that which falls or happens; cadere, to fall), a word used in various senses traceable to the derivation. In grammar, the "cases" are the various forms in the declension of a noun, adjective or pronoun, the Latin word being a translation of the Greek παράρασις, falling, applied by Aristotle to the variations from the simple form of the word, whether noun, verb or adjective (of which the adverb would be a παράρασις). Later grammarians confined the term to nouns, and included the nominative. In law, "case" is the common term for a case made out before a court of justice. Certain technical legal usages also are noted. Action on the case means an action for the recovery of damages for an injury to the person or property, where the act done was not immediately injurious (see CONTRACT; TORT). A case stated is a statement of facts drawn up by one court for the opinion of another on a point of law. A special case is a statement of facts agreed to on behalf of two or more litigant parties, and submitted for the opinion of a court of justice as to the law bearing upon the facts so stated. A leading case is a decision which settles some point of importance. In the legal systems of the United Kingdom and of the United States decided cases are considered authoritative for courts of at least equal jurisdiction with those in which the judgments were given, but on the continent of Europe the rule is, following that of the Roman law, that they are instructive but not authoritative.

(2) (O. Fr. casse, mod. chasé, Lat. cæpsa, from capere, to hold; cf. "cash"), a box, sheath or covering. The term is applied to the natural protective covering of seed-vessels, and of a pupa or chrysalis. It is also used of a box containing instruments, pistols, swords, &c., and sometimes of the contents. In building, a "case" is the facing where the backing may be of inferior material; the framework in which a window or chimney is placed; or the wall surrounding a stair, "staircase" properly signifying the whole structure of walls and stairs. In bookbinding, a "case" means the boards and back in which the books are bound; and in typography, the tray, divided into partitions, containing the type ready for the compositor's use.

CASEMATE (Ital. casa, a house, and matta, dull or dim), an armoured vault or chamber, or in field fortification, a bomb-proof shelter; in architecture, a hollow moulding, chiefly employed in cornices.

CASEMENT (from a Lat. form casamentum), in architecture, a frame in wood or metal, which holds the glass of a window, and is hung by hinges either at the top, bottom or sides.

CASERTA, a town and episcopal see of Campania, Italy, the capital of the province of Caserta, situated 21 m. N. by E. of Naples by rail via Accerra, and 23 m. via Aversa. Pop. (1901) town, 19,180; commune, 33,373. The modern town (239 ft.) was a mere village belonging to the Caetani family of Sermontia, who were counts of Caserta, until its purchase from them by Charles IV., of Naples, and the erection of the royal palace, begun by Luigi Vanvitelli (van Wittel) in 1752, but not completed until 1774 for Charles's son Ferdinand IV. It forms a rectangle, the south front being 830 ft. long and 134 ft. high, with 37 windows in each storey. The interior is richly decorated with marbles, almost all of which, except the white Carrara marble, are Neapolitan or Sicilian. The staircase, the chapel
and the theatre are especially sumptuous. The extensive gardens which occupy the hillside behind the palace are adorned with fountains and cascades; the botanical garden contains many trees from northern climates. Two miles north of S. Leonardo, a village founded by Ferdinand IV. in 1790, is a royal casino, and large silk factories which are still active. The old town (Caserta Vecchia) lies high (1310 ft.) about 3 m. to the north-east. It was founded in the 9th century by the Lombards of Capua. The cathedral has not suffered from restoration. It was completed in 1153. It is a copy of that of Sessa Aurunca, and preserves the type of the Latin basilica. The campanile, Sicilian in style, was completed in 1234, while the dome, which betrays similar motives, is even later. Its pulpit is decorated with the richest polychrome mosaic that can be found anywhere in Sicily or south Italy, and is quite Moslem in its brilliance. It is indeed remarkable to find these motives in a church so far inland (Bertaux, *L'Art dans l'Italie méridionale*, Paris, 1904, i. 353, &c.). There are also the ruins of the old walls.

**CASE-SHOT**—a projectile used in ordnance for fighting at close quarters. It consists of a thin metal case containing a large number of bullets or other small projectiles (see AMMUNITION). Case-shot was formerly called "canister," though the term now used occurs as early as 1625.

**CASH.** (1) From O. Fr. *case*, mod. *caisse*, a box or chest; cf. "case ", a term which, originally meaning a box in which money is kept, is now commonly applied to ready money or cash. In commercial and banking usage "cash" is sometimes confined to specific cases. It is also in opposition to bills, drafts or securities, applied to bank-notes. Hence " to cash " means to convert cheques and other negotiable instruments into coin. In bookkeeping, in such expressions as " petty cash, " " cash-book, " and the like, it has the same significance, and so also in " cash-payment " or ready-money payment as opposed to " credit," however the payment may be made by coin, notes or cheque.

The "cash on delivery " or " collect on delivery " system, known as C.O.D., is one whereby a tradesman can, through a delivery agency, send goods to a customer, and have the money due to him collected on the delivery of the same, with a guarantee from the carrier that, if no money be collected, the goods shall be returned. The function of such an agency is performed in the United States of America by the express companies (see EXPRESS). In most countries of the continent of Europe the post office acts as such an agent, as in Germany (where the system is known as *Post-Nachnahme*) and in France (contre remboursement). It is also in use in India, where it is known as "value payable," and was introduced in 1877 in Australia. The advantages of the system are obvious, from the point of view both of the customer, who can, by post or telegram, order and obtain speedy delivery from large towns, and of the tradesman, whose area of trade is indefinitely extended. The system does away with credit or the delay and inconvenience of paying in advance. The success of the large "catalogue" houses in America has been mainly due to the system as operated by the express companies. At various times, notably in 1904, it has been proposed that the General Post Office of the United Kingdom should adopt the system. The consistent opposition of the retail traders in large urban centres other than the large stores, and of the country shopkeeper generally, has been sufficient to secure the refusal of the postmaster-general to the proposed scheme, but a commencement was made in 1908 for orders not exceeding £20 between the United Kingdom and Egypt, Cyprus and Malta, and certain British post offices in Turkey and Tangier.

(2) From Tamil *kasī, Sinhalese kasi*, a small coin, adopted by Portuguese as *caixa*, a box, and similarly assimilated in English to "cash " above), a name given by English residents in the East to native coins of small value, and particularly to the copper coinage of China, the native name for which is *tsien*. This, the only coin minted by the government, should bear a fixed ratio of 1000 cash to one *tael* of silver, but in practice there is no such fixed value. It is the universal medium of exchange throughout China for all retail transactions. The *tsien* is a round disk of copper alloy, with a square hole punched through the centre for stringing. A string of cash amounts to 3000 pieces, or a *tael*.

**CASHEL**, a city in Co. Tipperary, Ireland, in the east parliamentary division, 5 m. S.E. of Goold's Cross and Cashel station on the main line of the Great Southern & Western railway, 96 m. S.W. from Dublin. Pop. of urban district (1901) 2938. The town, which lies at the base of the Rock of Cashel, is of somewhat poor appearance, but contains several public buildings. There are also the cathedral church of St John the Baptist (c. 1780), the deanery house (once the bishop's palace), and a Roman Catholic church. Cashel gives name to a Roman Catholic archdiocese.

The Rock of Cashel is the object of chief interest in the place. This elevation of limestone formation rises abruptly from the plain to a height of about 300 ft. and is a commanding object for many miles around. Its summit is occupied by one of the most interesting assemblages of ruins in Ireland, consisting of the remains of St Patrick's cathedral, a round tower, Cormac's chapel, and an ancient cross. The chapel, which is said to have been erected by King Cormac M'Carthy in the 12th century, combines the ancient form of high stone roof, having chambers between the pitch and the vault, with the richest Norman decoration; the chancel arch being of especial magnificence. The cathedral, of the 13th century, is cruciform in design, with lanced windows and pointed arches, and contains many interesting sculptures and tombs. In the adjoining cemetery there stands, on a rude pedestal, whereon the kings of Munster were crowned, the "Cross of Cashel," with an effigy of St Patrick and a portrayal of the Crucifixion sculptured on its sides. The round tower, situated at the north-east angle of the cathedral, is 80 ft. high with a circumference of 50 ft., and unlike the neighbouring ruins is built, not of the limestone of the Rock, but of freestone. Of the defences of the Rock a massive guard-tower and portions of the wall remain. At the base of the Rock is Hore Abbey, a Cistercian foundation (1272), exhibiting a similar style of architecture to that of the cathedral on the Rock; and within the town is a Dominican priory (1243), of which the east window is a beautiful example of the style of the period. From the Rock itself an extensive prospect is commanded over the rich Golden Vale backed by the Galtee Mountains, the Devil's Bit, and other ranges; the clustering roofs of the city providing a picturesque foreground.

The history of Cashel belongs to the early period of Irish chronology. Legend states that the vision of an angel blessing the Rock, by two swineherds early in the 5th century, led Corc Mac Lughdheach, king of Munster, to establish a stronghold here. It became one of the principal seats of the kings of Munster, but in 1101 it was given over to the church by King Murkertagh O'Brien. It afterwards became noteworthy as the place where Henry II. received the homage of O'Brien, king of Limerick, and still later, where Edward Bruce held his Irish parliament. The cathedral was burnt in 1495 by the earl of Kildare. Cashel was taken by storm during the wars of 1647. It was reduced from an archbishopric to a bishopric in 1839, and was disenchanted, on account of corrupt practice, in 1870, having previously returned one member to parliament.

**CASHEW NUT**, the fruit of the cashew, cadju or acaju tree, *Anacardium occidentale* (nat. ord. Anacardiaceae), a native of the West Indian Islands. The fruit is kidney-shaped, about an inch in length, and the kernel is enclosed in two coverings, the outer of which is smooth, grey and leathery. Inside this external rind is a dark-coloured layer, containing an excessively acid juice. The kernels have a bland, oily, pleasant taste. They are much eaten, both raw and roasted, in the tropical regions in which the tree is cultivated, and they yield a light-coloured, sweet-tasted oil, said to be equal to olive oil for culinary purposes. The fruit-stalk, immediately under the fruit, is swollen and fleshy, and assumes a pear-like shape. This swollen portion of the stalk has a pleasant acid taste, and is eaten under
of the Army Act, 1881, s. 16, for “behaving in a scandalous manner unbecoming an officer and a gentleman.” “Cashiering” involves not merely the loss of the commission, but also a permanent disqualification from serving the state in any capacity.

**CASH REGISTER,** a species of calculating machine adapted for use in connexion with the cash-tills of shops, in order to provide a record of the money received. Such machines are made in great variety and widely used. Sometimes the records are constituted by holes punched in a roll of paper; in other cases they are shown on dials by the aid of adding mechanism. A common form has a number of keys, each representing a particular sum and each attached to a counting mechanism which records how many times it has been used. By pressing appropriate combinations of these keys the amount of any purchase can be registered, and the combined records of all the counting mechanism give the total that has been passed through the machine in any selected period. Each key when pressed also raises an indicator which informs the customer how much he has to pay. In their more elaborate forms these cash registers may have a separate money-drawer for each assistant employed in the shop, thus enabling the proprietor to ascertain how many customers each man has served and how much money he has taken, and also to fix responsibility for mistakes, bad money, &c. The machines are also made to deliver a printed receipt for each purchase, showing the amount, date and assistant concerned, and they may be arranged to keep separate records of credit sales, money received on account, and money paid out.

**CASILINUM** (mod. Capua), an ancient city of Campania, Italy, 3 m. N.W. of the ancient Capua. Its position at the point of junction of the Via Appia and Via Latina, and at their crossing of the river Volturnus by a three-arched bridge, which still exists, gave it considerable importance under the Roman republic; and while the original pre-Roman town, which was doubtless dependent on the neighbouring Capua, stood entirely on the left (S.) bank, surrounded on three sides by the river, the Roman city extended to the right bank also; remains of it have been found at some 25 ft. below the modern ground-level, the river-bed having risen considerably. In the Second Punic War it was occupied by Fabius Cunctator in 217 B.C., taken by Hannibal after a gallant defence by troops from Praeneste and Perusia in the winter of 216-215, but recaptured in the following year, serving the Romans as their base of operations against Capua. It lost its independence and became a *profectura.* Caesar conducted a colony thither in 59 B.C., which was renewed by Antony in 44 B.C. The veterans took Octavian’s side after Caesar’s death, but it seems to have been united with Capua before the time of Vespasian, and it does not occur in the list of independent communities given by Pliny, who indeed (Hist. Nat. iii. 70) speaks of the *mortis Casilini reliqua* and, only its position at the junction of the roads redeemed it from utter insignificance. (T. As.)

**CASIMIR III.,** called “The Great,” king of Poland (1310-1370), the son of Wladislaus Lokietek, king of Poland, and Jadwiga, princess of Kalisch, was born at Kowel in Kujavia in 1310. Casimir belongs to that remarkable group of late medieval sovereigns who may be called the fathers of modern diplomacy, inasmuch as they legislated warfare to its proper place as the instrument of politics, and preferred the council-chamber to the battle-field. He was educated at the court of Charles Robert of Hungary, who had married Casimir’s beautiful sister Elizabeth, and who gave his brother-in-law an excellent education under Italian masters. In his youth Casimir was considered frivolous and licentious; while his sudden flight from the field of Płowce, the scene of his father’s great victory over the Teutonic knights, argued but poorly for his personal courage. When, therefore, he ascended the Polish throne in 1333, the future of his country, which then consisted of little more than the lately reunited provinces of Great and Little Poland, seemed dark indeed; especially as she was still at war with the Teutonic Order and with John of Luxembourg, king of Bohemia, who claimed the crown of Poland also. Fortunately Casimir was a man of penetrating genius. His father had been a hero who...
truly entitled entire to his sword, yet the heroic struggle of a lifetime had barely sufficed to keep at bay the numerous and potent foes with which Poland was environed. Casimir recognized from the first that further fighting against the Teutonic odds was unwise. A careful, calculating dynastic policy, which aimed at the establishment of an equilibrium by means of prudent compromisories and defensive alliances, was, he rightly judged, the best guarantee for the future safety and glory of Poland. Casimir began by tying the hands of the Teutonic Order by the truce of Thorn; he induced the king of Bohemia to relinquish his claims to the Polish throne by consenting to leave him a free hand in Silesia (conference of Trencšen, early in 1335); and subsequently he attended the celebrated congress of Visegrad (November 12-December 3, 1335), where Charles Robert entertained him and the king of Bohemia magnificently. At this congress the differences between Casimir and John of Bohemia were finally adjusted; peace was made between the king of Poland and the Teutonic Order on the basis of the cession of Pomerania, Kulm, and Michalow to the knights, who retroceded Kujavia and Dobrzyń; and the kings of Hungary and Poland further agreed to assist each other in the acquisition of the south-eastern border province of Halicz, or Red Russia (very nearly corresponding to the modern Galicia), in case the necessity for intervention should arise. The Holy See, jealous of the growing power of the house of Luxemburg, attempted to set aside the decrees of the congress of Visegrad, by urging Casimir to take up arms against the knights once more; but Casimir prudently refrained from hostilities, and ultimately compensated himself in the south-east for his losses in the north. To guarantee still further the integrity of Poland, Casimir, who had no male issue, concluded a compact with Charles Robert whereby he recognized Louis, Charles Robert’s son, as the successor to the Polish crown; Louis on his part contracting to confirm the privileges of the Polish gentry and clergy, and to rule Poland through natives only.

In 1340 the death of George II. of Halicz, and the ravaging of that fruitful border principality by the Tatars, induced Casimir and Charles Robert to establish their joint influence there, and in 1344 the Red Russian boyar, Demetrius Detko, was appointed starosta, or governor, in the names of the two kings. Nine years later Lubart of Lithuania, who also had claims upon Red Russia, disputed the sway of Poland in that principality. Hungary coming to the assistance of Poland, Lubart was defeated and taken prisoner; but Casimir, anxious to avoid a bloody war with Lithuania’s Tatar allies, came to a compromise with Lubart whereby Poland retained Halicz with Lemberg, while Vladimir, Bela, and Bresze fell to the share of Lithuania. With the Teutonic knights, still Poland’s most dangerous foes, Casimir preserved peace, by the cessions during his reign. He kept them within due bounds by using the influence of the Luxemburgers against them at the papal court; but the disputes between Poland and the order were ultimately settled by the peace of Kalisz (July 23, 1343), when the knights engaged for the first time to pay tribute to the Polish crown. John of Bohemia was also a constant thorn in the side of Casimir. Silesia, now split up into seventeen principalities, was the bone of contention between them; and when Casimir suddenly invaded that country, took Wschowa, and made Prince Charles of Bohemia a prisoner, war between the two kingdoms actually broke out and Casimir was besieged in Cracow by the Czechs. But his Hungarian allies hastened to his assistance, and the mediation of the Holy See restored peace in 1346. The death of the adventurous John at Crécy, and the election of his son as emperor, still further improved the situation. Charles IV., a cautious sovereign with many cares, was as anxious for the maintenance of peace as Casimir himself. Thus the relations between them were never very seriously disturbed.

Throughout his reign Casimir never neglected the great work of domestic reform, greatly aided by Jaroslaw Skotowicki, archbishop of Gnesen, formerly a professor at Bologna. The first result of their joint labours was the much-needed codification of the laws of Great and Little Poland in 1347. This was followed by the establishment of a supreme court of appeal in 1357.

Towards everything like disorder, tyranny, or aristocratic oppression, Casimir was always inexcusably severe; all disturbers of the peace were remorselessly put to death as the worst enemies of the state, and for this reason Casimir was entitled to the honourable title of “the Peasants' King.” The pride of nobility was most noticeable in the province of Great Poland, where outrageous acts of violence were of everyday occurrence. To remedy the evil, Casimir drew up and promulgated the severe statute of Great Poland, which went to the very root of the matter and greatly strengthened the hands of the king’s justices. Casimir also did much for education. Stimulated by the example of Charles IV., who had founded the university of Prague in 1348, Casimir on the 12th of May 1364 established and richly endowed the first university of Cracow, which had five professors of Roman law, three of Canon law, two of physics, and one master of arts. The security of the kingdom was sensibly promoted by the erection of a cordon of fortresses on its north-eastern borders, and a blow was given to foreign interference when Casimir succeeded in gaining dominant influence over the independent Polish principality of Masovia, which had hitherto gravitated between Bohemia and the Teutonic Order.

Casimir’s last political act was the conclusion of a fresh alliance with Louis of Hungary against Charles IV. at Buda in 1369. He died on the 5th of November 1370 from the effects of a stroke of paralyzing illness. Though married three times Casimir left no sons; but he had the satisfaction of knowing that his domains would pass into the hands of a nephew every whit as capable and sagacious as himself.

See Jan Leniek, The Congress of Visegrad (Pol.), (Lemberg, 1884); J. K. Kochanowski, Casimir the Great (Pol.), (Warsaw, 1900); Kazimierz J. Gorzyci, The Annexation of Red Russia by Casimir the Great (Pol.), (Lemberg, 1889); Stanislaw Kryzanowski, The Embassy of Casimir the Great to Avignon (Pol.), (Cracow, 1900). (R. N. B.)

CASIMIR IV., king of Poland (1427–1492), second son of Vladislaus II. Jagiello, was appointed while still a lad grand-duke of Lithuania by his father, and crowned king of Poland at Cracow in June 1447, three years after the death of his elder brother, Vladislaus III., at the battle of Varna. The cause of this long interregnum was the disinclination of the Lithuanians to part with their prince till their outstanding differences with Poland, relating chiefly to the delimitation of the frontiers of the two states, had been settled. Casimir’s reign of forty-five years was epoch-making for Poland. He was without doubt one of the great statesmen of his age, concealing beneath a simple exterior and homely habits a profound political sagacity and an unerring common-sense, and possessing in a high degree those useful qualities of patience, moderation, and tenacity, which characterized nearly all the princes of the house of Jagiello. Throughout life he steadfastly followed two guiding principles—the preservation of the political union between Poland and Lithuania at whatever cost, and the recovery of the lost lands of old Poland. It was due entirely to his steadfast adherence to these principles that Poland in the course of the 15th century rose to the rank of a great power; but by a singular irony of fate, Casimir, in consequence of his unsparing efforts to make his country glorious and prosperous, entirely forfeited the popularity of his Polish subjects, whose true interests he understood far better than they did themselves. Thus his refusal to sacrifice Polish to Lithuanian or Lithuanian to Polish interests caused both Poles and Lithuanians to accuse the far-seeing monarch of partiality and favouritism; while his anti-German policy, on which the future safety of the dual state depended, could only be carried through by the most humiliating concessions to patrician pride and greed. His difficulties were moreover considerably enhanced by the fact that he was not of an essentially martial temperament, and could not therefore appeal to the heroic spirit of the Polish character.

The great triumph of Casimir’s reign was the final subjugation of the Teutonic Order, a triumph only accomplished after a harassing and desultory thirteen years’ war, during which Casimir’s own subjects gave him more trouble than all his enemies. The pretext of the rupture was the attack of the
knights to crush the Prussian diet, which, bearing as it did most of the burdens, claimed fairly enough a proportionate share in the government of the Prussian provinces. Excommunicated by the pope and placed under the ban of the Empire, the Prussian cities and gentry naturally turned to their nearest neighbour, Poland, for protection. In October 1453 they placed themselves beneath the overlordship of Casimir; on the 4th of February, Elizabeth formally renounced their ancient allegiance to the Order; and some weeks later captured no fewer than fifty-seven towns and castles. On the 6th of March 1454 Casimir issued a manifesto directing the incorporation of the Prussian provinces with Poland, but granting them at the same time freedom from taxation and full autonomy. But except in the border province of Great Poland, the acquisition of this new territory excited little interest and no enthusiasm in Poland generally. The local diets granted subsidies with a niggard hand, and for the conduct of the war the king soon had to depend almost entirely on Hussite mercenaries, who frequently turned against him when their wages were not paid. The Polish gentry on the other hand exhibited far less energy in the field than in the council chamber; they were defeated again and again by the knights, and showed themselves utterly incapable of taking fortresses. No wonder then if in the earlier years of the war the Order recovered its lost ground, and the king, irritated before the successes by the suicidal and often bloodstained councils of the knights, threatened to retire to the forests of Lithuania. But manlier counsels prevailed, the struggle was resumed, and after the bloody victory of Puck (September 17, 1462) the scales of fortune inclined decisively to the side of Poland. Finally the Holy See intervened, and by the second peace of Thorn (October 14, 1466) all West Prussia, as it is now called, was ceded to Poland, while East Prussia was left in the hands of the knights, who held it as a fief of the Polish crown.

The intervention of the Curia, which hitherto had been hostile to Casimir because of his steady and patriotic resistance to papal aggression, was due to the permutatons of European politics. The pope was anxious to get rid of the Hussite king of Bohemia, George Podébrad, as the first step towards the formation of a league against the Turk. Casimir was to be a leading factor in this combination, and he took advantage of it to procure the election of his son Władysław as king of Bohemia. But he would not commit himself too far, and his ulterior plans were frustrated by the rivalry of Matthias Corvinus, king of Hungary, who even went so far as to stimulate the Teutonic Order to rise against Casimir. The death of Matthias in 1490 was a great relief to Poland, and Casimir employed the two remaining years of his reign in consolidating his position still further. He expired rather suddenly while hunting at Troki in Lithuania in June 1492.

The feature of Casimir's character which most impressed his contemporaries was his extraordinary simplicity and sobriety. He, one of the greatest monarchs in Europe, habitually wore plain Cracow cloth, drank nothing but water, and kept the most austere of tables. His one passion was the chase. Yet his liberality to his ministers and servants was proverbial, and his unquenched enemies he always treated with magnificent generosity. Casimir's married life was singularly happy. His consort, Elizabeth of Austria, "the mother of the Jagiello's, born by him six sons and seven daughters, mother by her affectionate and good counsel materially relieved the constant anxieties and grievous burdens of his long and arduous reign."

See Jan Dlugosz, Opera (Cracow, 1857); August Sokolowski, Illustrated History of Poland (Pol.), vol. ii. (Vienna, 1904). (R. N. B.)

CASIMIR-PÉRIER, JEAN PAUL PIERRE (1847–1907), fifth president of the French Republic, was born in Paris on the 8th of November 1847, being the grandson of Casimir Père (q.v.) the famous premier of Louis Philippe. He entered public life as secretary to his father, A. V. L. C. Périer, who was minister of the interior under the presidency of Thiers. In 1874 he was elected general councillor of the Aube, and was sent by the same department to the chamber of deputies in the general elections of 1876, and he was always re-elected until his presidency. In spite of the traditions of his family, Casimir-Périer joined the group of Republicans on the Left, and was one of the 363 on the Seize-Mai (1877). If he refused to vote the expulsion of the princes in 1883, and resigned as deputy upon the enactment of the law, it was only owing to personal connexions with the family of Orleans. On the 17th of August 1883 he became undersecretary of state for war, and retained that position until the 7th of January 1885. From 1890 to 1892 he was vice-president of the chamber, then in 1894 president. On the 3rd of December 1896 he became prime-minister, holding the department of foreign affairs, resigned in May 1894, and was re-elected president of the chamber. On the 24th of June 1894, after the assassination of President Carnot, he was elected president of the republic by 451 votes against 105 for Henri Brisson and 97 for Charles Dupuy. His presidency lasted only six months. The resignation of the Dupuy ministry on the 14th of January 1895 was followed the next day by that of the president. Casimir-Périer explained his action by the fact that he found himself ignored by the ministers, who did not consult him before taking decisions, and did not keep him informed upon political events, especially in foreign affairs. From that time he definitely and absolutely abandoned politics, and devoted himself to business—especially mining. At the trial of Dreyfus at Rennes, Casimir-Périer's evidence, as opposed to that of General Mercier, was of great value to the cause of Dreyfus. He died on the 11th of March 1907.

Casino or Cassino is also the name given to a game of cards of obscure origin, played with a full whist-pack. The object is to take as many cards as possible, particularly such as have special value. It may be played by two, three or four persons, partners sitting opposite one another. The player at the dealer's right is in possession of the money (pots) (see below). The dealer (selected by the cut of the lowest card) deals four cards to each player by twos and also, just before dealing to himself, four to the table, face upwards. The eldest hand begins the game by playing a card in one of three ways. Either he may take one of the exposed cards on the table by matching it with one from his own hand; or he may put one of his cards upon one of the table cards and call the sum of the pips (called building); or thirdly, falling to do either of these things, he must trail, i.e. lay a card face upwards on the table beside the exposed cards, and the player at his left then plays in his turn. When each player has played out all four of his cards the dealer deals four more all round, and the game proceeds until the pack is exhausted. The game either (1) ends at this juncture, the player having secured the most points winning; or (2) the side or player first securing 21 points wins; or (3) the points secured in a given number of deals may determine the winner. The points and their respective values are as follows: (or Great) Casino (ten of diamonds), 2; Little Casino (deuce of spades), 1; Cards (greatest number), 3; Spades (greatest number), 1; Aces, 1 each or 4 together; Sweeps, 1 each. Thus, without sweeps, the maximum points in one deal are 11. A sweep is a play that clears the table of all exposed cards. The game then proceeds by the next player placing a card on the table face upwards.

"Building," referred to above, is done as follows. Should a 3 lie exposed on the table, a player may place a 4 upon it, saying, "I build a 7," and, if it is not disturbed before his next turn, he may then take the two cards with another 7 from his hand. It follows that no combination may be built unless the builder holds the proper card in his hand. But a build may be increased. Thus, in the case cited above, another player may put a 2 upon the two cards which make 7 and say, "I build a 9," in which case the original
CASIUM—CASKET LETTERS 449

builder loses control of the build unless he also holds a 9 in his hand or can himself increase the build again; for instance, adding an ace and calling 10. In the old way of playing the ace counted 1, the deuce 2, and so on as at whist, excepting that all court cards counted to.

In the popular variation called Royal Casino, now almost universally played, the ace counts either 1 or 14, the king, the queen 12 and the knave 11. In this manner the opportunities for simple and increased building are greatly multiplied, resulting in a much longer game.

If a player has made a build he must take it on his next play, unless he can take some other card. He cannot have two builds on the table at the same time, nor increase another build if he already has one on the table. Both builders may be increased if the player combines a 3 and 4 lying on the table and places a 7 from his hand upon them, saying, "I build sevens," this build can be taken only with a 7, and cannot be built upon further. If in the case of the first build there is another 7 in his hand, he, when playing partners each may take in the other's builds, or may build to a card that has been declared by his partner; e.g. if his partner has built an 8 that has been captured by an opponent, he may build another 8 with a card from his own hand to the 8 that he knows to be in his partner's hand, even though he has no 8 himself. In playing, i.e. laying down a card without matching or building, one usually plays small cards, avoiding aces and (if Big and Little Casino have not yet been played) tens and deuces, as well as any cards one has reason to think will be of service to the enemy. High cards are usually played last, as they are stronger in taking combinations. Such rules are, however, quite general, each situation calling for its own treatment. In the case of the cards laid on the table becoming the property of the player taking the last trick.

A good memory and keen powers of observation are essential in playing this game.

In Twenty-One Point Casino nothing is scored until the end of the deal. The second or third deal is usually necessary before one side scores the requisite 21. In the final deal each side keeps a mental count of the points made, and as soon as 21 are scored the game is claimed and the points shown. But if, when added to those already scored in previous deals, they make more than 21, the claim is lost.

In counting out cards count first, followed by spades, Big Casino, Little Casino, aces and sevens, in that order.

Spade Casino is a variation in which the usual 11 points count as in the other cases, but the additional score is increased to 14 points on the knave of spades, which counts 2, making 24 points in all. These are scored on a cribbage-board, each point being marked as it is made. The game is for 61 points, or once round the board and into the game-hole.

CASAUM, an ancient town of Italy, probably of Volscian origin. Varro states that the name was Sabine, and means forum seimus, and also that the town itself was Samnite, but he is probably wrong. When it came under Roman supremacy is not known, but it probably received the citizenship in 188 B.C. It was the most south-easterly town in Latium adjectum, situated on the Via Latina about 40 m. W.N. of Capua. It appears occasionally in the history of the Hannibal War. Varro possessed a villa near it, in which later on Mark Antony held his orgies. Towards the end of the republic it was a praefectura, and under the empire it appears as a colony (perhaps founded by the triumvirs), though in two (not local) inscriptions it is called municipiis. Strabo speaks of it as an important town; Varro mentions the olive-oil of its district as especially good. The older Volscian Casino must have stood on the hill (1715 ft.) above the Roman town (148 ft.), where considerable remains of fortifications in Cyclopean masonry, of finely hewn blocks of limestone, still exist. The site is now occupied by the Benedictine monastery of Monte Cassino (q.v.) founded by St Benedict himself in 529. A number of Roman inscriptions from Casino are preserved there. The wall which runs south-west and west starting from the west side of the monastery, for a total length of about 300 yds., is not so clearly traceable on the other side of the hill, though there is one fragment under the east side of the monastery; but it seems to have defended the summit and was perhaps the original acropolis. The Roman town lay at the foot of the mountain, close to the Via Latina. The amphitheatre, erected by Ummidia Quadratilla (whose passion for actors is mentioned by Pliny, Epist. vii. 24, on the occasion of her death at the age of about eighty), is still existing; it is built of opus reticulatum and the five entrances are by arches of larger blocks of stone; it is approximately circular in plan. The external walls are 50 ft. high. The seats in the interior have disappeared. Above it on the hillside is a theatre of opus reticulatum, less well preserved. Close by is a building converted into the Cappella del Crocifisso, originally perhaps a tomb in the Via Latina; it is a chamber in the form of a Greek cross, constructed of large masses of travertine, with a domed roof of the same material. On the opposite bank of the Rapido are the ruins called Monticelli, attributed to the villa of Varro, a part of which was frequently drawn by the architects of the 16th century (T. Ashby in Papers of the British School at Rome, ii. 19). The medieval town of S. Germano, which resumed the name Cassino in 1871, lies a little to the north. The cathedral was founded in the 8th century, but the present building was constructed in the 17th century. The church of S. Maria delle Cinque Terre contains twelve ancient marble columns; above the town is a picturesque medieval castle.

CASIRI, MIGUEL (1710—1791), a learned Maronite, was born at Tripoli (Syria) in 1710. He studied at Rome, where he lectured on Arabic, Syriac, Chaldean, philosophy and theology. In 1748 he went to Spain, and was employed in the royal library at Madrid. He was successively appointed a member of the Royal Academy of History, interpreter of oriental languages to the king, and joint-librarian at the Escorial. In 1793 he became principal librarian, a post which he appears to have held till his death in 1791. Casiri published a work entitled Bibliotheca Arabico-Hispanica Escorialensis (2 vols., Madrid, 1760-1770). It is a catalogue of above 1800 Arabic MSS., which he found in the library of the Escorial; it also contains a number of quotations from Arabic works on history. The MSS. are classified according to subjects; the second volume gives an account of a large collection of geographical and historical MSS., which contain valuable information regarding the wars between the Moors and the Christians in Spain. Casiri's work is not yet obsolete, but a more scientific system is adopted in Hartwig Demberghen's incomplete treatise, Les Manuscrits arabes de l'Escorial (Paris, 1884).

CASKET, a small box or coffre, commonly used for jewels, money, papers, or other objects of value. The etymology is doubtful. It is possibly a diminutive of "caske," a barrel for wine or other liquor. The Spanish casco meant also a skull, helmet, or rent of an ocean, and is probably connected with cascar, to break open, Latin quassare, French casser, to break, shake. The French casque, casquet, of the same origin is only used of a helmet, and the sense of "small chest" is not found in languages other than English. Skeat suggests that the word is a corruption of French cassette, diminutive of casse, box, Latin capsca, from capere, to hold, contain, cf. English "case." History and literature are full of references to the often disconcerting contents of these famous receptacles. The "Casket Letters" (q.v.) are one of the mysteries of history. In the 17th century, the casket plays an important part in Molière's L'Avare; Bluebeard gives his too-curious wife the keys of his caskets filled with precious stones; the contents of Saint-Croft's casket brought about the trial and condemnation of the marquise de Brinvilliers, the poisoner. This very ancient piece of furniture was no doubt derived from the chest, which was the original wardrobe. It was often an object of great value, covered with ivory, enamel, or stamped leather, enriched with precious metals or enamelled jewels. One which belonged to St Louis and is preserved in the Louvre is covered with enamelled shields of arms and other decorations. In the 16th and 17th centuries secret hiding-places were sometimes in the thickness of the lid or in a false bottom. The word is now little used—the natural result of the desuetude of the object; but auctioneers occasionally announce that they will sell a "casket of jewels," and undertakers, especially in the United States, frequently use it as a grandiose synonym for "coffin."
CASKET LETTERS

by T. F. Henderson (1889; second issue, 1890, being the more accurate); in The Mystery of Mary Stuart, by Andrew Lang (4th edition, 1904), and in Henderson’s criticism of that book, in his Mary, Queen of Scots (1905) (Appendix A). The conclusion arrived at here is that of Henderson, but it is reached independently.

The history of the letters must be given in summary. Henderson, in The Casket Letters (1889), was the first to publish and use as evidence a document of which the existence was made known in the fifth report of the royal commission on historical manuscripts. It is a sworn statement of the earl of Morton, written in 1568. A silver casket (originally Mary’s property, but then in the possession of Bothwell) was placed in his hands on the 20th of June, and was inspected by several nobles and gentlemen on the 21st of June 1567. Morton denies that the contents, the letters, sonnets, and some other papers, had been in any way tampered with. But if Moray could knowingly submit garbled evidence, Morton’s oath is of no value if uncorroborated.

Mary was, on the 21st of June 1567, a prisoner in Loch Leven Castle. A messenger was at once sent from Edinburgh to London with a letter from the Scottish and a verbal message. By July, don de Silva, the Spanish ambassador, reports on the authority of the French ambassador that du Croc, French envoy to Scotland, avered that Mary’s Scottish enemies have autograph letters of her proving her guilt, and himself possesses copies. Of these copies no more is heard, and they cannot be found. According to de Silva, Elizabeth said that she did not believe in the Letters, and that Lethington, who wrote to Cecil on the 21st of June, and sent a verbal message by the bearer, “had behaved badly in the matter,” whether that of the letters, or in general. On what evidence she based that opinion, if she really held it, is unknown. In December 1567 the Scottish parliament was informed that the letters were signed by Mary (they are unsigned), but the phrase is not used in the subsequent act of parliament. The letters were exhibited and apparently were read, probably read aloud. Mary’s party in September 1568 declared that they were garbled, and that the handwriting was not hers. In the end of July 1567 the earl of Moray, Mary’s brother, passing through London from France, told de Silva, as de Silva reported to his government, that there was proof of Mary’s guilt in a letter of three double sheets of paper signed by her.

According to Moray’s version of the letter, Mary was to try to poison Darnley in a house on the way between Glasgow and Edinburgh where he and she were to stop. Clearly Lord Livingstone’s house, Callendar, where they did rest on their journey, is intended. If this failed, Mary would put Darnley “in the house where the explosion was arranged for the night upon which one of the servants was to be married.” No such arrangement had been made, as the confessions of the murderers, at which Moray was present, clearly prove. It may be said that de Silva means “in the house in which the explosion was afterwards arranged.” But the earl of Lennox, Darnley’s father, understood Moray to mean that as early as January 21-22, 1567, the house of Kirk o’ Field, where Darnley was slain, had already been mined. Moray’s version of the letter made Mary tell Bothwell to poison or put away his wife. No such matters occur in Letter II; Moray spoke, he said, on the authority of “a man who had read the letter.” A similar account of this letter is given in a document of Darnley’s father, the earl of Lennox (Cambridge University Library MSS. Qo. 7. 47; f. 17 b). Can we suppose that “the man who had read the letter” invented much of its contents, and told them to Moray, who told de Silva, and told Darnley’s father, Lennox, then in or near London?

At this point comes the evidence—unknown to Froude, Skelton, Hosack, and Henderson in his book The Casket Letters—of a number of documents, notes of information, and indictments of Mary, written or for by the earl of Lennox. These MSS are in the University Library of Cambridge, and were transcribed by Father Stevenson. His transcripts were brought to light by Father Pollen, S. J., who lent them, with his own notes on them,
to Andrew Lang for use in his book, The Mystery of Mary Stuart (1903; 1904).

Not one of the Lennox documents is dated; all but one are endorsed in an English hand of the period. It may be conjectured that they were selected by Lennox from his papers, and lent by him to some one who was writing against Mary. Among them (Cambridge University MSS. Oo. 7. 47. fol. 17 b.) is a long indictment of Mary, in which Lennox describes a wicked letter of hers. As has been said, he closely follows Moray's version reported by de Silva in July 1567. Lennox also gives several stories of cruel words of Mary spoken to Darnley in the hearing of her servants.

Now, on the 11th of June 1568, Lennox was in the company of John Wood, a creature of Moray's, and Wood, as we saw, brought copies of the Scots renderings of the Letters into England in May–June 1568. It was argued by Andrew Lang that Wood was likely to show these letters to Lennox; and that as Lennox followed Moray's version of Mary's long and murderous letter, and does not follow Letter II., the murderous letter (a forgery) was then part of the dossier of Mary's accusers. Again, as Lennox's indictment of Mary (Cambridge Oo. 7. 47. fol. 17 b.) is based on the reports and sayings of Mary's servants, "not one cruel word to Darnley, and as Lennox had not these reports on the 11th of June 1568, for on that day he went to Scotland asking his friends to discover them and send them to him, the indictment (Oo. 7. 47) must have been composed long after the 11th of June. This must be so, for Lennox's letters of the 11th of June were intercepted by his foes, the Hamiltons, and were found in the Hamilton Muniment Room. Thus answers to his inquiries were delayed. (The letters of Lennox were published in Miscellany of the Mailand Club, vol. iv.)

Henderson, on the other side, believes that Wood "indubitably" showed to Lennox the Scots copies of the Casket Letters about the 11th of June 1568. But Lennox, he says, could not quote Letter II. in his indictment against Mary, and had to rest on Moray's version of July 1567, because Lennox's indictment was completed, and even laid before Elizabeth, as early as the 28th of May 1568. Henderson seeks to prove that this is so by quoting from Chalmers's Mary Queen of Scots (vol. ii. p. 289) the statement that Lennox and his wife on that day presented to Elizabeth a "Bill of Supplication," and (though he submits that the indictment (Oo. 7. 47) is a draft for the Bill) he strengthens his case by heading the indictment, which he publishes, Bill of Supplication. The document, in fact, is unendorsed, and without a title, and there is not a word of "supplication" in it. It is a self-contradictory history of the relations between Mary and Darnley.

Henderson's contention therefore seems erroneous. Lennox could not begin to prepare an English indictment against Mary till she was in England and in Elizabeth's power. He could not hear of this fact—Mary's arrival in England (May 16, 1568)—before, say, the 10th of May; and between the 10th of May and the 28th of May he could not write for and receive from Scotland "the reports and sayings of her servants." He did not possess them on the 11th of June, when he asked for them; he did not get them at once, for his letters were intercepted; the indictment (Oo. 7. 47) is rich in them; therefore that paper is not the "Bill of Supplication" of the 28th of May.

Thus the question remains, why, if Wood about the 11th of June showed to Lennox Letter II. in Scots, did Lennox follow Moray's erroneous version of July 1567? Because in June 1568 that version, forged, was in the Scots collection of the Casket Letters? If so, there was time for Lennox to lend to the accusers certain notes which a retainer of his, Thomas Crawford of Jordan Hill, swore (December 9, 1568) that he had made for Lennox (about January 22, 1567) of secret conversations between Darnley and Mary. Lennox (June 11, 1568) asked Crawford for his reminiscences, not of Darnley's reports of his talks with Mary, but of Crawford's own interview with her as she entered Glasgow to visit Darnley, probably on the 21st of January 1567. It follows that Lennox possessed Crawford's written notes of the Darnley and Mary conversations. If he had not possessed them on the 11th of June 1568, he must have asked Crawford for his reminiscences in these talks. But he did not ask.

Crawford's evidence was all-important, because it corroborated Mary's own account of her interviews with Darnley in Letter II. That part of the letter then, it is argued by many, is a forged interpolation based on Crawford's notes and memories. The force of this contention lies in the close verbal identities between Crawford's account of the Darnley–Mary interviews (see Crawford's Declaration of December 9, 1568, in Lang's Mystery of Mary Stuart, pp. 428-431; from State Papers Scotland, Elizabeth vol. xiii. No. 14. Record Office) and the corresponding passages in Letter II. (Mystery of Mary Stuart, pp. 396-398).

The verbal identities can only be explained in one of the following ways. Either Letter II. is here based on Crawford; or Crawford has copied Letter II. by way of corroborating it (a fatal step, if the case came before a modern English court of justice); or Darnley's memory of his conversation with Mary was so fresh, when he dictated his recollection of it to Crawford on 21st-22nd January 1567, that he reported speeches in almost the very same words as Mary used in writing Letter II. Henderson prefers the hypothesis that Lennox had lost Crawford's notes; and that the identities are explained by the "remarkably good memories of Crawford and Mary, or by the very exact report that Crawford, before preparing his declaration for the conference" (at Westminster, December 1568) "refreshed his memory by the letter." (Letter II., Mary Queen of Scots, p. 650.)

Mary did not need a particularly good memory; if she wrote, she wrote unchecked her recollections of the day's talk. But no human memory of a conversation reported on the 22nd of January 1567, could be so nearly "word perfect," as Crawford's must have been two years later. If Crawford "refreshed his memory by the letter," he exposed himself, and the entire case, by copying whole passages, often with few verbal changes. If he had access to his original notes of the 21st and 22nd of January 1567, then he was safe—that is, if Darnley's memory of the conversations tallied so exactly with Mary's. Whether that could be, Darnley dictating while still hot from the exciting interchange of words which he meant to report, is a question for psychologists. Experiments made by a person who possesses a good memory seem to show that the thing is very possible, especially if Darnley's mind was made up.

Thus the probabilities are delicately balanced. But if any one compares Crawford's whole declaration with Letter II. in Scots, he will find that Crawford has sources of information not yielded by Letter II.; while Letter II. abounds in matter spoken by Mary and Darnley which could not be borrowed by the hypothetical forger from Crawford's Declaration, for it does not contain the facts. These facts, again, in Letter II., are worthless to a forger, because they concern matters never alluded to in any of the records; never employed in any indictment (though Lennox's are copious in private talk between Darnley and Mary, "reports of her servants"), and totally useless for the purposes of the accusers. Here is one of several examples. Letter II. has, and Crawford has not, the statement that Darnley "showed me, amongst other talk, that he knew well enough that his brother had revealed to me what he (Darnley) had spoken at Stirling. Of this he (Darnley) denies half, and above all that (the brother) even came to his (Darnley's) chamber."

Nothing is known about this matter. The Lennox papers are full of reports of bitter words that passed between Darnley and Mary at Stirling (December 1566), where Darnley was sulking apart while the festivities of the baptism of his son (later James VI.) were being held. But nothing is said in the Lennox papers of words spoken by Darnley to Mary's brother (probably Lord Robert of Holrood) and revealed by Lord Robert to Mary. Lord Robert was the only friend of Darnley in Mary's entourage; and he even, according to the accusers, warned him of his danger in Kirk o' Field, to which they said that a Casket Letter (III.) referred. The reference is only to be seen by willing eyes.

Is it credible that a forger, using Crawford's Declaration, which is silent as to Mary's brother at Stirling, should have superfluously added what is not to any purpose? Could he have combined...
with Crawford's matter the passage "he (Darnley) showed me almost all that is in name of the Bishop and Sutherland, and yet I have never touched a word of what you (Bothwell) showed me . . . and by complaining of the Bishop, I have drawn it all out of him."

Who but Mary herself could have written about this unknown affair of the Bishop, and what had the supposed forger to gain by inventing and adding these references to affairs unconnected with the case?

There remains what looks like absolute proof that, in essence, Crawford's Declaration and Letter II are independent documents. We are not aware that this crucial point has been noticed by the earlier critics of the Letters. In Letter II. (paragraph 7, p. 398, in Lang's Mystery of Mary Stuart, 1901) Mary writes, "I asked why he (Darnley) would pass away in the English ship. He denies it, and swears thereunto; but he grants that he spoke unto the man." Here Crawford's declaration has, "She asked him why he would pass away in the English ship. He answered that he had spoken with the Englishman, but not of mind to go away with him. And, if he had, it had not been without cause, considering how he was used. For he had neither [means] to sustain himself nor his servants, and need not make further rehearsal thereof, seeing she knew it as well as he." (Mystery of Mary Stuart, p. 429)

It may seem to the reader doubtful whether these complaints are words of Darnley's, or an indignant addition by his friend Crawford. But Mary, in Letter II., shows that the complaints and the self-defence are Darnley's own. It was in paragraph 7 that she wrote about the English ship; she did not then give Darnley's remonstrances, as Crawford does. But in paragraph 18 (Mystery, p. 406) Mary returns to the subject, and writes, "He (Darnley) spoke very bravely at the beginning, as the bearer will show you, upon the subject of the Englishmen, and of his departing; but in the end he returned again to his humility."

Thus it is certain that Darnley had reported to Crawford his brave words and reproaches of Mary, which Crawford gives in the proper place. But Letter II. omits them in that place (paragraph 7); and only on her second day of writing, in paragraph 18, does Mary's mind recur to Darnley's first brave words"—"he spoke very bravely at the beginning," about his wrongs, "but in the end he returned again to his humility."

Here is proof positive that Crawford does not copy Letter II., but gives Darnley's words as reported to him by Darnley—words that Darnley was proud of,—while Mary, returning on the second day of writing to the topic, does not quote Darnley's brave words, but merely contrasts his speaking "very bravely at the beginning" with his pitiful and craven later submission; "he has ever the tear in his eye," with what follows. (Mystery, paragraph 12, p. 429.)

When we add to these and other proofs the strange lists of manuscripts in the middle of the pages of the letter, and the breach in internal chronology which was apparently caused by Mary's writing, on her second day, on the clean verso of a page on the other side of which she had written some lines during her first night in Glasgow; when we add the dramatic changes of her mood, and the heart-breaking evidence of a remorse not stifled by lawless love, we seem compelled to believe that she wrote the whole of Letter II.; that none of it is forged.

In The Mystery of Mary Stuart the evidence for an early forged letter was presented with confidence; the interpolation of forgeries based on Crawford's declaration was more doubtfully suggested. That position the writer now abandons. It may be asked why, after being with Wood on the 11th of June, did Lennox still rely on Moray's version of Mary's letter? The reply may be that the Scots versions were regarded as a great secret; that Lennox was a married man; and that though Lennox in June knew about Mary's letters, doubtless from Wood, or from common report (Bishop Jewell in a letter of August 1567 mentions that he had heard of them), yet Wood did not show to him the Scots copies. Lennox quotes Letter II. later, in an indictment to be read to the commission sitting at York (October 1568). But, on the other hand, as Lennox after meeting Wood wrote to Crawford for his reminiscences of his own interview with Mary (January 21, 1567), and as these reminiscences were only useful as corroborative of the priory's account in Letter II., it seems that Wood had either shown Lennox the letters or had spoken of their contents. In that case, when Lennox later quotes Moray's version, not Letter II. itself, he is only acting with the self-contradictory stupidity which pervades his whole indictment (Oo. 7, 47, fol. 17 b.).

The letters are not known to have been seen by any man—they or the silver casket—after the death of the earl of Gowrie (who possessed them). In May 1584 Bowes, the English ambassador to Holyrood, had endeavoured to procure them for Elizabeth, "for the secrecy and benefit of the cause." Conceivably the letters fell into the hands of James VI. and were destroyed by his orders.

(A. L.)

CASLON, the name of a famous family of English typefounders. William Caslon (1602-1766), the first of the name, was born at Cradley, Worcestershire, and in 1716 started business in London as an engraver of gun locks and barrels, and as a bookbinder's tool-cutter. Being thus brought into contact with printers, he was induced to fit up a type foundry, largely through the encouragement of William Bowyer. The distinction and legibility of his type secured him the patronage of the leading printers of the day in England and on the continent. The use of Caslon types, discontinued about the beginning of the 19th century, was revived about 1845 at the suggestion of Sir Henry Edward Midwinter, the most famous of Caslon typefounders. (Mystery of Mary Stuart, p. 430)

CASPARI, KARL PAUL (1814-1892), German Lutheran theologian and orientalist, was born of Jewish parents at Dessau, Anhalt, on the 8th of February 1814. He studied at Leipzig and Berlin, became a Christian in 1838, and in 1857 was appointed professor of theology at Christiania, having declined invitations to Rostock and Erlangen. He died at Christiania on the 11th of April 1892. Caspari is best known as the author of an Arabic grammar (Grammatica Arabica, 2 vols., 1844-1848; new edition, Arabische Grammatik, edited by A. Müller; 5th ed. 1885). He also wrote commentaries on the prophetic books of the Old Testament, dogmatic and historical works on baptism, and from 1857 helped to edit the Theologik Tidskrift for den evangelisk-lutherske Kirke i Norge. His writings include: Beiträge zur Einleistung in Jesaja (1848), and Alle und neue Quellen zur Geschichte des Taufsymbols und der Glaubensregel (1876).

CASPIAN SEA (anc. More Caspium or More Hyrcanum; Russian, Kaspiyskoe more; formerly Holowskoe More; Persian, Darya-i-Khoyev or Guran; Tatar, Ak-denghiz; the Skim and Jurjan of the ancient Eastern geographers), an inland sea between Europe and Asia, extending from 36° 30′ south to 47° 30′ north, and from 46° 50′ to 55° 10′ east. Its length is 760 m. from N. to S., and its breadth 100 to 280 m., and its area reaches 160,330 sq. m., of which 865 sq. m. belong to its islands. It fills the deepest part of a vast depression, sometimes known as the Aralo-Caspian depression, once an inland sea, the Eurasian Mediterranean or Sarmatean Ocean. At the present time its surface lies 86 ft. below the level of the ocean, or 67 ft. according to the Aral-Caspian levelling 1 and 242 ft. below the level of the Aral.

Hydrography and Shores.—The hydrography of the Caspian Sea has been studied by von Baer, by N. Ivaszhintsev (1819-1871) in 1862-1870, by O. Grimm, N. I. Andrusov (1859), and by J. B. Spindler (1897), N. von Seidlitz and N. Knipovich (1904) since the last quoted date. Its basin is divided naturally into three sections—(1) A northern, forming in the east the Gulf of Mortvyi Kuituk or Tsarievich Bay. This is the shallowest part, barely reaching a depth of 20 fathoms. It is being gradually

1 By the triangulation of 1840 its level was found to be 84 ft. below the level of the Black Sea. The Caucasus triangulation of 1860-1870 gave 89 ft.
silted up by the sedimentary deposits brought down by the rivers Volga, Ural and Terek. The western shore, from the delta of the Volga to the mouth of the Kuma, a distance of 170 m., is gashed by thousands of narrow channels or lagoons, termed limans, from 12 to 30 m. in length, and separated in some cases by channels of hillocks, called bugors, in others by sandbanks. These channels are filled, sometimes with sea-water, sometimes with overflow water from the Volga and the Kuma. The coastline of the Gulf of Mortvyi Kultuk on the north-east is, on the other hand, formed by a range of low calcareous hills, constituting the rampart of the Üst-Urt plateau, which intervenes between the Caspian and the Sea of Aral. On the south this gulf is backed by the conjoined peninsulas of Busachi and Manghishlak, into which penetrates the long, narrow, curving bay or fjord of Kaidak or Kar-a-su. (2) South of the line joining the Bay of Kuma with the Manghishlak peninsula, in 44° 10' N. lat., the western shore is higher and the water deepens considerably, being over one-half of the area 50 fathoms, while the maximum depth (between 41° and 42° N. lat.) reaches 417 fathoms. This, the middle section of the Caspian, which extends as far as the Apheron Peninsula, receives the Terek and several smaller streams (e.g. Sulak, Samur), that drain the northern slopes of the Caucasus. At Derbent, just north of 42° lat., a spur of the Caucasus approaches so close to the sea as to leave room for only a narrow passage, the Caspiae Pyla or Albanae Portae, which has been fortified for centuries. The eastern shore of this section of the sea is also formed by the Üst-Urt plateau, which rises 550 ft. to 750 ft. above the level of the Caspian; but in 49° N. lat. the Üst-Urt recedes from the Caspian and circles round the Gulf of Kara-bogha or Kara-bugaz (also called Aji-darya and Kuli-darya). This subsidiary basin is separated from the Caspian by a narrow sandbar, pierced by a strait 1½ m. long and only 115 to 170 yds. wide, through which a current flows continuously into the gulf at the rate of 13 to 5 m. an hour, the mean velocity at the surface being 3 m. an hour. To this there exists no compensating outflow current at a greater depth, as is usually the case in similar situations. The area of this lateral basin being about 7300 sq. m., and its depth but comparatively slight (3½ to 36 ft.), the evaporation is very appreciable (amounting to 3·2 ft. per annum), and sufficient, according to von Baer, to account for the perpetual inflow from the Caspian. South of the Kara-Bogha Bay the coast rises again in another peninsula, formed by an extension of the Balkhan Mountains. This marks (49° N. lat.) the southern boundary of the middle section of the Caspian. This basin may be, on the whole, considered as a continuation of the synclinal depression of the Manych, which stretches along the northern foot of the Caucasus from the Sea of Azov. It is separated from (3), the southern and deepest section of the Caspian, by a submarine ridge (30 to 150 fathoms of water), which links the main range of the Caucasus on the west with the Kopet-dagh in the Transcaspian region on the east. This section of the sea washes on the south the base of the Elbuz range in Persia, sweeping round it, and then, encroaching on the northern side of the Kara Kamen Kurs, passes round the Kizil-agach, to Astrabad at an average distance of 40 m. from the foot of the mountains. A little east of the Gulf of Ezenzi, which resembles the Kara-bogha, though on a much smaller scale, the Seif-rud pours into the Caspian the drainage of the western end of the Elbuz range, and several smaller streams bring down the precipitation that falls on the northern face of the same range farther to the east. Near its south-east corner the Caspian is entered by the Atrek, which drains the mountain ranges of the Turkoman (N.E.) frontier of Persia. Farther north, on the east coast, opposite to the Bay of Kizil-agach, comes the Balkhan or Krasnovodsky Bay. In the summer of 1894 a subterranean volcano was observed in this basin of the Caspian, in 38° 10' N. lat. and 52° 37' E. long. The depth in this section ranges from 300 to 500 fathoms, with a maximum of 602 fathoms.

**Drainage Area and Former Extent.—**The catchment area from which the Caspian is fed extends to a very much greater distance on the west and north than it does on the south and east. From the former it is entered by the Volga, which is estimated to drain an area of 550,000 sq. m., the Ural 39,000 sq. m., the Terek 59,000 sq. m., the Sulak 7000 sq. m., the Samur 4270 sq. m.; as compared with these, there comes from the south and east the Kura and Aras, draining the south side of the Caucasus over 87,250 sq. m., and the Seif-rud and the Atrek, both relatively short. Altogether it is estimated (by von Dingelstedt) that the total discharge of all the rivers entering into the Caspian amounts annually to a volume equal to 174·5 cub. m. Were there no evaporation, this would raise the surface of the sea 3.5 ft. annually. In point of fact, however, the entire volume of fresh water poured into the Caspian is only just sufficient to compensate for the loss by evaporation. Indeed in recent times the level appears to have undergone several oscillations. From the researches of Philippov it appears that during the period 1851-1888 the level reached a maximum on three separate occasions, namely in 1866-1869, 1882 and 1885, while in 1853 and 1873 it stood at a minimum; the range of these oscillations did not, however, exceed 3 ft. 6½ in. The Russian expedition which investigated the Kara-boghas in 1896 concluded that there is no permanent subsidence in the level of the sea. In addition to these periodical fluctuations, there are also seasonal oscillations, the level being lowest in January and highest in the summer.

The level of the Caspian, however, was formerly about the same as the existing level of the Black Sea, although now some 86 ft. below it. This is shown by the evidences of erosion on the face of the rocks which formed the original shore-line of its southern basin, those evidences existing at the height of 65 to 80 ft. above the present level. That a rapid subsidence did take place from the higher level is indicated by the fact that between it and the present level there is an absence of indications of erosive energy. There can be no real doubt that formerly the area of the Caspian was considerably greater than it is at the present time. Nearly one hundred and fifty years ago Pallais had his attention arrested by the existence of the salt lakes and dry saline deposits on the steppes to the east of the Caspian, and at great distances from its shores, and by the presence in the same localities of shells of the same marine fauna as that which now inhabits that sea, and he suggested the obvious explanation that those regions must formerly have been covered by the waters of the sea. And it is indeed the fact that large portions of the vast region comprised between the lower Volga, the Aral-Irtysh water-divide, the Dzungarian Ala-tau, and the outliers of the Tian-shan and Hindu-kush systems are actually covered with Aralo-Caspian deposits, nearly always a yellowish-grey clay, though occasionally they assume the character of a more or less compact sandstone of the same colour. These deposits attain their maximum thickness of 90 ft. east of the Caspian, and have in many parts been excavated and washed away by the rivers (which have frequently changed their beds) or been transported by the winds, which sweep with unmitigatedted violence across these wide unsheltered expanses. The typical deposit is seen in the yellow sands and yellowish gravelly deposits, or in the shells of marine animals living in both the Caspian and the Aral, though these deposits occur in beds of both seas only, namely (according to Ivan V. Mushketov [1850-1902]) Cardium edule, Dreissena polymorpha, Neritina liturata, Adacna vitrea, Hydrobia stagnalis, in the Kara-kum desert, and Lithoglyphus caspius, Hydrobia stagnalis, Anodonta ponderosa and the sponge Mertiniokera tuberculata, in the Kizil-kum desert. The exact limits of the ancient Aralo-Caspian sea are not yet settled, except in the north-west, where the Ergeni Hills of Astrakhan constitute an unmistakable barrier. Northwards these marine deposits are known to exist 80 m. away from Lake Aral, though they do not cross the Aral-Irtysh water-divide, so that this sea will not probably have been at that time connected with the Arctic, as some have supposed. The eastern limits of these deposits lie about 100 m. from Lake Aral, though Sverstov maintained that they penetrate into the basin of Lake Balkash. Southwards they have been observed without a break for 100 m. from Lake Aral, namely in the Sary-kamysh depression (the surface of which lies below the level of the Caspian) and up
the Uzboi trench for 100 m. from the latter sea. How far they reach up the present courses of the Oxus (Amu-darya) and Jaxartes (Syr-darya) is not known. Hence, it is plain that in late Tertiary, and probably also in Post-Tertiary, times the Aralo-Caspian Sea covered a vast expanse of territory and embraced very large islands (e.g. Ust-Urt), which divided it into an eastern and a western portion, communicating by one or two narrow straits only, such as on the south the Sary-kamysh depression, and on the north the line of the lakes of Chumshy and Asmantai. More than this, the Caspian was also, it is pretty certain, at the same epoch, and later, in direct communication with the Sea of Azov, no doubt by way of the Manych depression; for in the limans or lagoons of the Black Sea many faunal species exist which are not only identical with species that are found in the Caspian, but also many which, though not exactly identical, are closely allied. As examples of the former may be named—Archeobdella, Clussinia variabilis, Neritina litoralis, Gmelina, Gammarus moeoticus, Pseudocuma pentinata, Paramysis Baeri, Mesomysis Kovalevskyi and M. intermedia, Limnomyys Benedeni and L. Bragadi, and species of the ichthyological fauna Gobius, Clupea, and Anguilla; while illustrating the latter class the Black Sea contains Dreissena bugensis (allied to D. rostriformis and D. Grimmii), Cardium ponticum (to C. caspium), C. coloratum (to Monodactyla edentula), Amphitrite antiqua (to A. Kovalevskyi) and Bythotrephes caudatus (to B. socialis).

In the opinion of Russian geologists the separation of the Caspian from the great ocean must have taken place at a comparatively recent geological epoch. During the early Tertiary age it belonged to the Sarmatian Ocean, which reached from the middle Danube eastwards through Rumania, South Russia, and along both flanks of the Caucasus to the Aralo-Caspian region, and westwards had open communication with the great ocean, as indeed the ancient geographers Eratosthenes, Strabo and Pliny believed it still had in their day. This communication began to fail, or close up presumably in the Miocene period; and before the dawn of Pliocene times the Sarmatian Ocean was broken up or divided into sections, one of which was the Aralo-Caspian sea already discussed. During the subsequent Ice Age the Caspian flowed over the steppes that stretch away to the north, and was probably still connected with the Black Sea (itself as yet unconnected with the Mediterranean), while northwards it sent a narrow gulf or inlet far up the Volga valley, for Aralo-Caspian deposits have been observed along the lower Kama in 26° N. lat. Eastwards it penetrated up the Uzboi depression between the Great and Little Balkan ranges, so that that depression, which is strewn (as mentioned above) with Post-Tertiary marine deposits, was not (as is sometimes supposed) an old bed of the Oxus, but a gulf of the Caspian. After the great ice cap had thawed and a period of general desiccation set in, the Caspian began to shrink in area, and simultaneously its connections with the Black Sea and the Sea of Aral were severed.

Fauna.—The fauna of this sea has been studied by Eichwald, Kowalevsky, Grimm, Dybowski, Kessler and Sars. At the present time it represents an intermingling of marine and freshwater forms imported by the oceanic Currents below the Jaxartes strait to the latter, species of Cyprinus, Perca and Sillurus, also a lobster. Other marine forms are Rhizopod (Rotalia and Textillaria), the sponge Amorphia, the Amphipods worm, the molluscs Cardium edule and other Cardiadia, and some Amphipods (Camacea and Mystacae), but they are forms which either tolerate variations in salinity or are especially characteristic of brackish waters. But there are many species inhabiting the waters of the Caspian which are not foundelsewhere. These include Protozoa, three sponges, Verme, twenty-five Molluscs, numerous Amphipods, fishes of the genera Gobius, Benthophilus and Cebitis, and one mammal (Phoca caspia). This last, together with some of the Mystacae and the species Gyphometos entomus, exhibits Arctic characteristics, which has suggested the idea of a geologically recent connexion between the Caspian and the Arctic, an idea of which no real proofs have been as yet discovered. The Knipovich expedition in 1904 found no traces of organic life below the depth of 220 fathoms except micro-organisms and a single Oligochaete; but above that level there exist abundant evidences of rich pelagic life, more particularly from the surface down to a depth of 80 fathoms.

Fisheries.—No other inland sea is so richly stocked with fish as the Caspian, especially off the mouths of the large rivers, the Volga, Ural and Terek. The fish of greatest economic value are sturgeon (four species), which yield great quantities of caviare and isinglass, the herring, the salmon and the lobster. The annual catch of the entire sea is valued at an average of one million sterling. Some 50,000 persons are engaged in this industry off the mouth of the Volga alone. Seals are hunted in Krasnovodsk Bay.

Salinity.—The proportion of salt in the water of the Caspian, though varying in different parts and at different seasons, is generally much less than the proportion in oceanic water, and even less than the proportion in the water of the Black Sea. In fact the salinity of the Caspian is only three-eights of that of the ocean. In the northern section, which receives the copious volumes brought down by the Volga, Ural and Terek, the salinity is so slight (only 0-0075% in the surface layers) that the water is quite drinkable, its specific gravity being higher than 1-0016. In the middle section the salinity of the surface layers increases to 0-015%, though it is of course greater along the shores. The concentration of the saline ingredients proceeds with the greatest degree of intensity in the large bays on the east side of the sea, and more especially in that of Kara-bogzha, where it reaches 16-3% (Spindler expedition). The bottom of this almost isolated basin is covered for an area of 1,000 sq. m. with a deposit of Epsom salts (sulphate of magnesia), 7 ft. thick, amounting to an estimated total of 1,000,000,000 tons. While the proportion of common salt to sulphate of magnesia is as 11 to 1 in the water of the Black Sea and as 2 to 1 in the Caspian water generally, it is as 17-8 to 5-03 in the Kara-bogzha. The salinity of the surface water of the southern section of the Caspian averages 1-5%.

Climate.—The temperature of the air over the Caspian basin is remarkable for its wide range both geographically and seasonally. The January isotherm of 15° F. skirts its northern shore; that of 40° crosses its southern border. But the winter extremes go far below this range: during the prevalence of north-east winds the thermometer drops to -20°, or even lower, on the surrounding steppes, while on the Ust-Urt plateau a temperature of -30° is not uncommon. Again, the July isotherm of 70° crosses the middle section of the Caspian, nearly coinciding with the January isotherm of 25°, while that of 80° skirts the southern shore of the sea, nearly coinciding with the January curve of 40°, so that the mean annual range over the northern section of the sea is 60° and over the southern section 40°. The former section, which is too shallow to store up any large amount of heat during the summer, freezes for three or four months along the shores, effectually stopping navigation on the lower Volga, but out in the middle ice appears only when driven there by northerly winds.

The prevalent winds of the Caspian blow from the south-east, usually between October and March, and from the north and north-west, commonly between July and September. They sometimes continue for days together with great force, rendering navigation dangerous and driving the sea-water up over the shores. They also, by heaping up the water at the one end of the sea or the other, raise the level temporarily and locally to the extent of 4 to 8 ft. The currents of the Caspian were investigated by the Knipovich expedition; it detected two of special prominence, a south-going current along the west shore and a north-going current along the east shore. As a consequence of this the temperature of the water is higher on the Asiatic than on the European side. The lowest temperature obtained was 35°-24° on the bottom in shallow water, the highest 70°-7 on the surface. But in March the temperature, as also the salinity, was tolerably uniform throughout all the layers of water. Another interesting fact ascertained by the same expedition is that the amount of oxygen contained in the water decreases rapidly with the depth: off Derbent in the middle section of the sea the amount diminished from 5-6 cc. per litre at a depth of 100 metres.
(330 ft.) to 0.32 cc. per litre at a depth of 700 metres (say 2300 ft.). At the same time samples of water drawn from the bottom were found to contain 0.2 cc. of sulphuric acid per litre. In the southern section of the sea the decrease is not so rapid. In this latter section Spindler ascertained in July 1897 that the temperature of the surface water 60 m. from Baku was 72°, but that below 10 fathoms it sank rapidly, and at 200 fathoms and below it was constant at 21°-22°.

**Navigation.**—The development of the petroleum industry in the Apsheron peninsula (Baku) and the opening (1886) of the Transcaspian railway have greatly increased the traffic across the Caspian Sea. A considerable quantity of raw cotton is brought from Ferghana by the latter route and shipped at Krasnovodsk for the mills in the south and centre of Russia, as well as for countries farther west. And Russia draws her own supplies of petroleum, both for lighting and for use as liquid fuel, by the sea route from Baku. Other ports in addition to those just mentioned are Astrakhan, on the Volga; Petrovsk, Derbent and Lenkoran, on the west shore; Enseli or Reih, and Astara on the Persian coast; and Mikhailovsk, on the east coast. The Russians keep a small naval flotilla on the Caspian, all other nations being debarred from doing so by the treaty of Turkmanchay (1828).

At various times and by various persons, but more particularly by Peter the Great, the project has been mooted of cutting a canal between the Volga and the Don, and so establishing an unrestricted water communication between the Caspian and the Black Sea; but so far none of these schemes has taken practical shape. In 1900 the HYDROTECNICAL CONGRESS OF RUSSIA discussed the proposal of constructing a canal to connect the Caspian more directly with the Black Sea by cutting an artificial waterway about 22 ft. deep and 180 ft. wide from Astrakhan to Taganrog on the Sea of Azov.

**Cass, Lewis** (1782-1866), American general and statesman, was born at Exeter, New Hampshire, on the 9th of October 1782. He was educated at Phillips Exeter Academy, joined his father at Marietta, Ohio, about 1799, studied law there in the office of Return Jonathan Meigs (1766-1825), and was admitted to the bar at the age of twenty. Four years later he became a member of the Ohio legislature, and in 1812 he served under General William Hull, whose surrender at Detroit he strongly condemned, and under General W. H. Harrison, and rose from the rank of colonel of volunteers to be major-general of Ohio militia and finally to be a brigadier-general in the regular United States Army. In 1813 he was appointed governor of the territory of Michigan, the area of which was much larger than that of the present state. This position gave him the chief control of Indian affairs for the territory, which was then occupied almost entirely by natives, there being only 6000 white settlers. During the eighteen years in which he held this post he rendered valuable services to the territory and to the nation; he extinguished the Indian title to large tracts of land, instituted surveys, constructed roads, and explored the lakes and rivers of the Mississippi. His relations with the British authorities in Canada also while the War of 1812 were at times very trying, as those officials persisted in searching American vessels on the Great Lakes and in arousing the hostility of the Indians of the territory against the American government. To those experiences was largely due the antipathy for Great Britain manifested by him in his later career. Upon the reorganization of President Jackson's cabinet in 1831 he became secretary of war, and held this office until 1836. It fell to him, therefore, to direct the conduct of the Black Hawk and Seminole wars. He sided with the president in his nullification controversy with South Carolina and in his removal of the Indians from Georgia, but not in his withdrawal of the government deposits from the United States Bank.

In 1836 General Cass was appointed minister to France, and became very popular with the French government and people. In 1842, when the Quintuple Treaty was negotiated by representatives of England, France, Prussia, Russia and Austria for the suppression of the slave trade by the exercise of the right of search, Cass attacked it in a pamphlet entitled "An Examination of the Questions now in Discussion between the American and British Governments Concerning the Right of Search," and presented to the French government a formal memorial which was probably instrumental in preventing the ratification of the treaty by France. In this same year the Webster-Ashburton treaty between Great Britain and the United States was concluded, and, as England did not thereby relinquish her claim of the right to search American vessels, Cass, after having taken such a decided stand in this controversy, felt himself in an awkward position, and resigned his post. His attitude on this question made him very popular in America, and he was a strong, but unsuccessful, candidate for the Democratic nomination for the presidency in 1844. From 1845 to 1848 and from 1849 to 1857 he was a member of the United States Senate, and in 1846 was a leader of those demanding the "re-annexation" of all the Oregon country south of 54°00' or war with England, and was one of the fourteen who voted against the ratification of the compromise with England at the 49th parallel. He loyally supported Polk's administration during the Mexican War, opposed the Wilmot Proviso, and advocated the Compromise Measures of 1850 and the Kansas-Nebraska Bill of 1854. In his famous "Nicholson letter" of December 1847 he made what was probably the earliest enunciation of the doctrine of "popular sovereignty," namely, that the people of the territories should decide for themselves whether or not they should have slavery.

In 1848 he received the Democratic nomination for the presidency, but owing to the defection of the so-called "Barnburners" (see FREE-SOIL PARTY) he did not receive the united support of his party, and was defeated by the Whig candidate, Zachary Taylor. His name was again prominent before the Democratic convention of 1852, which, however, finally nominated Franklin Pierce. On account of his eminently conservative attitude on all questions concerning slavery, General Cass has been accused of pandering to the southern Democrats in order to further his political aspirations. His ideas of popular sovereignty, however, were not inconsistent with the vigorous Democratic spirit of the west, of which he was a typical representative, and it is not clear that he believed that the application of this principle would result in the extension of slavery. As the west became more radically opposed to slavery after the troubles in Kansas, Cass was soon out of sympathy with his section, and when the Republicans secured control of the legislature in 1857 they refused to return him to the Senate. President Buchanan soon afterward made him secretary of state, and in this position he at last had the satisfaction of obtaining from the British government an acknowledgment of the correctness of the American attitude with regard to the right of search (or "visitation," as Great Britain euphemistically termed it). In December 1860 he retired from the cabinet when the president refused to take a firmer attitude against secession by reinforcing Fort Sumter, and he remained in retirement until his death at Detroit, Michigan, on the 17th of June 1866. He wrote for the *North American* and the *American Quarterly Reviews*, and published *Inquiries Concerning the History, Traditions and Languages of Indians Living Within the United States* (1853), and France: Its King, Court and Government (1840).

See W. T. Young, *Life and Public Services of General Lewis Cass* (Detroit, 1852); W. L. G. Smith, *Life and Times of Lewis Cass*
CASSABA—CASSANDRA

(New York, 1896). The best biography is by A. G. McLaughlin, 

CASSABA, a town of Asia Minor, in the sanjak of Manisa, 63 m. E. of Smyrna, with which it is connected by rail. Pop. estimated at 23,000, of which two-thirds are Mussulman; but the estimate is probably excessive. It has considerable local trade, and exports the products of the surrounding district. Cotton is the most important article, and there are ginning factories in the town; the silkworm is largely raised and exported; and the "melons of Cassaba" are sent not only to Smyrna but to Constantinople. There are fragments of marbles built into the houses, but the modern town does not seem to occupy any ancient site of importance.

CASSAGNAC, BERNARD ADOLPHE GRANIER DE (1806-1880), French journalist, was born at Avignon-Bergelle in the department of Gers on the 11th of August 1806. In 1832 he began his career as a Parisian journalist, contributing ardent defenses of Romanticism and Conservatism to the 

Revue de Paris, the Journal des Débats, and to La Presse. Then he founded a political journal, L'Épope (1845-1848), in which his political polemics by support of Guizot brought him notoriety and not a few duels. In 1851, in the Constitutionnel, he declared himself openly an imperialist; and in 1859 was elected as "official candidate" by the department of Gers. As journalist and deputy he actively supported an absolutist policy. He demanded the restoration of religion, opposed the laws in favor of the press, and was a member of the club of the rue de l'Arcade. In March 1868 he accused the Liberal deputies of having received money from the king of Prussia for opposing the emperor, and when called upon for proof, submitted only false or trivial documents. After the proclamation of the republic (4th of September 1870) he fled to Belgium. He returned to France for the elections of 1876, and was elected deputy. He continued to combat all the republican reforms, but with no advantage to his party. He died on the 31st of January 1880. In addition to his journalistic articles he published various historical works, now unimportant.

His son, PAUL ADOLPHE MARIE PROSPER GRANIER DE 

CASSAGNAC (1843-1904), while still young was associated with his father in both politics and journalism. In 1866 he became editor of the Conservative paper Le Pays, and figured in a long series of political duels. On the declaration of war in 1870 he volunteered for service and was taken prisoner at Sédan. On his return from prison in a fortress in Silesia he continued to defend the Bonapartist cause in Le Pays, against both Republicans and Royalists. Elected deputy for the department of Gers in 1876, he adopted in the chamber a policy of obstruction "to discredit the republican régime." In 1877 he openly encouraged MacMahon to attempt a Bonapartist coup d'état, but the marshal's refusal and the death of the prince imperial foilcd his hopes. He now played but a secondary rôle in the chamber, and occupied himself mostly with the direction of the journal L'Autorité, which he founded. He was not re-elected in 1902, and died in November 1904. His sons took over L'Autorité and the belligerent traditions of the family.

CASSANA, NICCOLÒ (1650-1714), often called NICOLETO, Italian painter, was born at Venice, and became a disciple of his father, Giovanni Francesco Cassana, a Genoese, who had been taught the art of painting by Bernardino Strozzi ("il Prete Genovese"). Having painted portraits of the Florentine court, and also of some of the English nobility, Niccolò was invited to England, and introduced to Queen Anne, who sat to him for her likeness, and conferred on him many marks of favour. He died in London in 1714, having given way to drinking in his later years. Cassana was a man of the most vehement temper, and would wallow on the ground if provoked with his work. One of his principal paintings is the "Conspiracy of Catiline," now in Florence.

CASSANDER (c. 350-297 B.C.), king of Macedonia, eldest son of Antipater, first appears at the court of Alexander at Babylon, where he defended his father against the accusations of his enemies. Having been passed over by his father in favour of Polyperchon as his successor in the regency of Macedonia, Cassander allied himself with Ptolemy Soter and Antigonus, and declared war against the regent. Most of the Greek states went over to him, and Athens also surrendered. He further effected an alliance with Eurydice, the ambitious wife of King Philip Arrhidaeus of Macedon. Both she and her husband, however, together with Cassander's brother, Nicanor, were soon after slain by Olympias. Cassander at once marched against Olympias, and, having forced her to surrender in Pydna, put her to death (316). In 310 or 309 he also murdered Roxana and Alexander, the wife and son of Alexander the Great, whose natural son Heracles he bribed Polyperchon to poison. He had already connected himself with the royal family by marriage with Thessalonica, Alexander the Great's half-sister, and of course entered into the contest for the imperial crown. He agreed with and followed the plans of Antigonus, and was also interested in the commerce of the East. He met in the van of the army which had arrived at Thessalonica, transformed theTHEMIS into a new city, and the ruins of Potidaea. See Diod. Sic. xviii., xix., xx.; Plutarch, Demetrius, 18. 31, Phocion, 31: also Macedonian Empire.

CASSANDER (or CASSANT), GEORGE (1513-1566), Flemish theologian, born at Pitthem near Bruges, went at an early age to Louvain and was teaching theology and literature in 1541 at Bruges and shortly afterwards at Ghent. About 1549 he removed to Cologne, where, after a profound study of the points of difference between the Catholic and reformed churches, he devoted himself to the project of reunion, thus anticipating the efforts of Leibnitz. In 1561 he published anonymously De Officiis sii ac publicae tranquillitatis sive amans viri in hoc dissidio religionis (Basel), in which, while holding that no one, on account of abuses, has a right utterly to subvert the Church, he does not disguise his dislike of those who exaggerated the papal claims. He takes his standpoint on Scripture explained by tradition and the fathers of the first six centuries. At a time when controversy drowned the voice of reason, such a book pleased neither party; but as one of the German princes thought that he could heal the breach, the emperor Ferdinand asked him to publish his Consultatio de Articulis Fidei inter Catholicos et Protestanttes Controversias (1565), in which, like Newman at a later date, he tried to put a Catholic interpretation upon Protestant formularies. While never attacking dogma, and even favouring the Roman church on the ground of authority, he criticizes the papal power and makes reflections on practices. The work, attacked violently by the Louvain theologians on one side, and by Calvin and Beza on the other, was put on the Roman Index in 1617. He died at Cologne on the 3rd of February 1566. The collected edition of his works was published in 1616 at Paris.

CASSANDRA, in Greek legend, daughter of Priam and Hecuba. She was beloved of Apollo, who promised to bestow on her the spirit of prophecy if she would comply with his desires. Cassandra accepted the proposal; but no sooner had she obtained the gift than she laughed at the tempter, and refused to fulfil her promise. Apollo revenged himself by ordaining that her predictions should be discredited (Apollodorus iii. 12. 5); and hence it was in vain that on the arrival of Helen she prophesied the ruin of Troy. On the capture of that city she was ravished by Ajax, the son of Oileus, in the temple of Minerva (Strabo vi. p. 264). In the distribution of the booty, Cassandra fell to the lot of Agamemon; but again her foresight was useless, for he would not believe her prediction that he should perish in his own country. The prophecy was fulfilled, for both were slain through the intrigues of Clytemnestra (Odyssey, xii. 421 ff.). It is to be noticed that there is no mention in Homer of her prophetic gifts. Together with Apollo, she was worshipped under the name of Alexandra.
CASSANO ALL'IONIO—CASSEL

CASSANO ALL'IONIO, a town of Calabria, Italy, in the province of Vibo Valentia, is situated on the Ionian Sea, 11 m. S.W. of Vibo. It is a manufacturing and commercial center, with industries including food processing, textiles, and paper. The town is known for its beautiful beach and fishing port. Population: 11,000.

CASSEL, a city of Germany, capital of the former electorate of Hesse-Cassel, and since its annexation by Prussia (1866), now part of Lower Saxony. Top. (1866) 64,985; (1961) 90,446. It is pleasantly situated in a hilly region, with a beautiful setting. Cassel is a center of trade and industry, with factories producing machinery, textiles, and chemicals. Population: 87,000.

CASSINI, the family of French astronomers and mathematicians, was prominent in the 18th century. The most famous member was Giovanni Domenico Cassini (1625-1712), who made important contributions to the study of the planets, especially Saturn. He discovered the Cassini Division in the ring system of Saturn, and also observed the phase changes of Venus and the variability of the star Algol. Cassini was the director of the Paris Observatory from 1671 to 1712.

CASSO, a town of Italy, in the province of Udine, Friuli-Venezia Giulia. Casso is situated on the Tagliamento River, 17 m. N.E. of Udine. It is a market town, producing wool and wine. Population: 10,000.

CASSOWARY, a large flightless bird of Australia and New Guinea, related to the emu. It is characterized by a long neck, which is used to throw stones and other objects as a defense mechanism. The bird also has a distinctive helmet of feathers on its head.

CASSIUS, a Roman soldier and politician, was a close associate of Julius Caesar. He played a key role in the events leading up to Caesar's assassination. Cassius was one of the leaders of the conspiracy that overthrew Caesar's regime.

CASSINI'S DIVISION, a narrow gap in the ring system of Saturn, discovered by Giovanni Domenico Cassini in 1675. It is located between the bright Cassini Division and the dimmer Encke Division, and is about 100,000 km wide.

CASSON, a genus of flowering plants in the family Casurnaceae, native to Africa. The plants are small, woody shrubs with spiny leaves and small flowers, which are used in traditional medicine.
CASSELL—CASSIANUS

by Jerome Napoleon, but in 1906 money was voted for a new building on the Auetor. A new Rathaus (town-hall) has been erected. The founding of the Kassel Museum, containing collections of pictures and antiquities of Hessian origin, museum of natural history and ethnography, an industrial exhibition hall, and an industrial art school. A handsome Gothic Lutheran church was erected in 1892-1897, a post office (Renaissance) in 1881, and new administrative offices and law courts in 1876-1880. The municipal (or Murhard) library, in the Hanau park, contains 118,000 volumes. The most noticeable of the modern public monuments are those to the emperor William I. (1807), to the musician Spohr (1883), and the Löwenbrunnen (1881). In the Karlsaue, a favourite public promenade lying just below the Schöne Aussicht, are the Orangerie and the marble baths. Cassel is the headquarters of the XI. German army corps, and has a large garrison. It is a favourite residence for foreigners and retired officers and government officials. The industries embrace engine-building, the manufacture of railway carriages and plant, scientific instruments, porcelain, tobacco and cigars, lithography, lute-spinning, iron-founding, brewing and gardening.

On a slope of the Habichtswald Mountains, 3 m. W. of Cassel, and approached by an avenue, is the summer palace of Wilhelmshöhe, erected in 1787-1794. Napoleon III. resided here as a prisoner of war, after the battle of Sedan. The surrounding gardens are adorned with fountains, cascades, lakes and grottos, the principal fountain sending up a jet of water 15 ft. high and 12 in. in diameter. Here also is an interesting building called the Löwenburg, erected in 1793-1796 in the style of a fortified castle, and containing among other things portraits of Tudors and Stuarts. The principal curiosity is the Karlsruhe cascade, which is placed in a broad ravine, thickly wooded on both sides. A staircase of 900 steps leads to the top. On one of the landings is a huge rudely-carved stone figure of the giant Enceladus, and at the top is an octagon building called the Riesenschloß, surmounted by a colossal copper figure of the Farnese Hercules, 31 ft. high, whose club alone is sufficiently capacious to accommodate from eight to ten persons. In different parts of the park, and especially from the Octagon, charming views are obtained. The park was first formed by the landgrave Frederick II., the husband of Mary, daughter of George II. of England, and was finished by his successor the landgrave William, after whom it was named.

The earliest mention of Cassel is in 913, when it is referred to as Cassala. The town passed from the landgraves of Thuringia to the landgraves of Hesse in the 13th century, becoming one of the principal residences of the latter house in the 15th century. The church is dedicated to the Virgin Mary. The fortifications of the town were restored by the landgrave Philip the Magnanimous and his son William IV. during the 16th century, and it was greatly improved by the landgrave Charles (1654-1730), who welcomed many Hugenots who founded the upper new town. In 1762 Cassel was captured by the Germans from the French; after this the fortifications were dismantled and New Cassel was laid out by the landgrave Frederick II.

In 1809 it became the capital of the kingdom of Westphalia; in 1813 it was bombarded and captured by the Russian general Chernichew; in 1830, 1831 and 1848 it was the scene of violent commotions; from 1830 to 1835 it was occupied by the Prussians, the Bavarians and the Austrians; in 1836 it was occupied by the Prussians, and in 1867 it was made the capital of the newly-formed Prussian province of Hesse-Nassau.

See Fideris, Geschichte der Haupt- und Residenzstadt Kassel (Kassel, 1882); Fr. Müller, Kassel seit 70 Jahren (2 vols., 2nd ed., Kassel, 1893); and Hessler, Die Residenzstadt Kassel und ihre Umgebung (Kassel, 1902).

CASSELL, JOHN (1817-1865), British publisher, was born in Manchester on the 23rd of January 1817. His father was the landlord of a public-house, and John was apprenticed to a joiner. He was self-educated, gaining by his own efforts a considerable acquaintance with English literature and a knowledge of French. He came to London in 1836 to work at his trade, but his energies at this time were chiefly centred in the cause of temperance, for which he was an active worker. In 1847 he established himself as a tea and coffee merchant, and soon after started publishing business with the aim of supplying good literature to the working classes. From the offices of the firm, which became in 1850 Messrs. Cassell, Petter, Galpin & Co., were issued the Popular Educator (1852-1855), the Technical Educator (1857-1872), the Magazine of Art (1858-1903), Cassell's Magazine (from 1852), and numerous editions of standard works. A special feature of Cassell's popular books was the illustration. At the time of the Crimean War he procured from Paris the cuts used in L'Illustration, and by printing them in his Family Paper (begun in 1853) secured a large circulation for it. The firm was converted in 1883 into a limited liability company, under the name of Cassell & Company, Limited. John Cassell died in London on the 2nd of April 1865.

CASSIA (Lat. cassia, Gr. κάσσα), the aromatic bark derived from Cinnamomum cassia. The greater part of the supply coming from China, it is sometimes termed Chinese cinnamon. The bark is much thicker than that of true cinnamon; the taste is more pungent and the flavour less delicate, though somewhat similar to that of cinnamon. The properties of cassia bark depend on the presence of a volatile oil—the oil of cassia, which is imported in a fairly pure state as an article of commerce from Canton. Cassia bark is in much more extensive demand on the continent of Europe than in Great Britain, being preferred to cinna-...

1 The Via Traiana Nova, or the (viae) tres Traianae, mentioned in inscriptions with the Cassia and Clodia as under the same curator, are not certainly identifiable.

2 Having regard to the military importance of Arretium during the Punic wars, it is difficult to believe that no direct road existed to this point before 187 B.C.
Provence about 360, but he spent the early part of his life in the monastery of Bethlehem with his friend Germanus, and his affinities were always Eastern rather than Western. In company with Germanus he visited Egypt, and dwelt for several years among the ascetics of the desert near the banks of the Nile. In 403 he repaired to Constantinople, where he received ordination as deacon at the hands of Chrysostom. At Marseilles (after 410) he founded two religious societies—a convent for nuns, and the abbey of St Victor, which during his time is said to have contained 5000 inmates. In later times his writings enjoyed a high reputation, and were adopted by the monks and nuns of Port Royal. He was eventually canonized; and a festival in his honour long continued to be celebrated at Marseilles on the 25th of July. Cassianus was one of the first and most prominent of the Semi-Pelagians, maintaining that while man is by nature sinful, he yet has some good remaining in him, and that, while the immediate gift of God's grace is necessary to salvation, his assistance may be obtained by man's own efforts. He further asserted that God is always willing to bestow his grace on all who seek it, though, at the same time, it is true that he sometimes bestows it without its being sought. These views have been held by a very large part of the Church from his time, and embrace much of the essence of Arminianism. The style of Cassianus is spacious, and shows no literary polish, but its direct simplicity is far superior to the rhetorical affectations which disfigure most of the writings of that age. At the request of Castor, bishop of Apt, he wrote two monumental and influential treatises on the monastic life. The *De Institutione Coenobiorum* (twelve books) describes the dress, the food, the devotional exercises, the discipline and the special spiritual dangers of monastic life in the East (gluttony, unchastity, avarice, anger, gloom, apathy, vanity and pride). The *Collationes Patrum*, a series of dialogues with the pious fathers of Egypt, deals with the special difficulties of which the monks were liable; and other dangers of monastic living may be avoided or overcome. At the request of Leo (then archdeacon of Rome) he wrote against Nestorius his *De Incarnatione Domini* in seven books.

**CASSINI**, the name of an Italian family of astronomers, four generations of whom succeeded each other in official charge of the observatory at Paris.

**GIOVANNI DOMENICO CASSINI** (1625-1712), the first of these, was born at Perinaldo near Nice on the 8th of June 1625. Educated by the Jesuits at Genoa, he was nominated in 1650 professor of astronomy in the university of Bologna; he observed and wrote a treatise on the comet of 1652; was employed by the senate of Bologna as hydraulic engineer; and appointed by Pope Alexander VII. inspector of fortifications in 1657, and subsequently director of waterways in the papal states. His determinations of the rotation-periods of Jupiter and Venus in 1665-1667 enhanced his fame; and Louis XIV. applied for his services in 1669 at the state observatory then in course of erection at Paris. The pope (Clement IX.) reluctantly assented, on the understanding that the appointment was to be temporary; but it proved to be irrevocable. Cassini was naturalized as a French subject in 1673, having begun work at the observatory in September 1671. Between 1671 and 1684 he discovered four Saturnian satellites, and in 1675 the division in Saturn's ring (see SATURN); made the earliest sustained observations of the zodiacal light, and published, in *Les Éléments de l'astronomie vérifiés* (1684), an account of Jean Richer's (1639-1696) geodetical operations in Cayenne. Certain oval curves which he proposed to substitute for Kepler's ellipses as the paths of the planets were named after him "Cassinians." He died at the Paris observatory on the 11th of September 1712.

A partial autobiographical left by Giovanni Domenico Cassini was published by his great-grandson, and in the Memoirs of the *Public de l'Observatoire de Paris* (1902). See also C. Wolf, *Histoire de l'Observatoire de Paris* (1902), p. 234 and passim. (A. M. C.)

**CASSIODORUS** (not Cassiodorus), the name of a Syrian family settled at Scylacium (Squillace) in Bruttilia, where it held an influential position in the 5th century A.D. Its most important member was Flavius Magnus Aurelius Cassiodorus Senator (a.d. 480-589), responsible for the famous "*Variorum*" (neither a title) the name used by himself in his official correspondence. His father held the offices of *comes privatarum* et *sacrarum largitionum* (controller of the emperor's private revenue and the public exchequer) under Odoacer, and subsequently
CASSIOPEIA—

attached himself to Theodoric, by whom he was appointed corrector (governor) of Bruttii and Lucania, and praefectus praetorio in a capacity which sometimes—consistently (legal assessor) to his father, and (probably in 527) praetor, an official whose chief duty at that time consisted in acting as the mouth-piece of the ruler, and drafting his dispatches. In 514 he was ordinary consul, and at a later date possibly corrector of his native province. At the death of Theodoric (526) he held the office of magister officiorum (chief of the civil service). Under Athalaric he was praefectus praetorio, a post which he retained till about 540, after the triumphal entry of Belisarius into Ravenna, when he retired from public life. With the object of providing for the transmission of divine and human knowledge to later ages, and of securing it against the tide of barbarism which threatened to sweep it away, he founded two monasteries—Vivarium and Castellum—in his ancestral domains at Squillace (others identify the two monasteries). The special duty which he enjoined upon the inmates was the acquisition of knowledge, both sacred and profane, the latter, however, being subordinated to the former. He also collected and emended valuable MSS., which he wished to transmit to posterity, and superintended the translation of various Greek works into Latin. He further amused himself with making scientific toys, such as sun-dials and water-clocks. As he is stated to have written one of his treatises at the age of ninety-three, he must have lived till after 580. Whether he belonged to the Benedictine order is uncertain. The writings of Cassiodorus evince great erudition, ingenuity and labour, but are disfigured by incorrectness and an affected artificiality, and his Latin partakes much of the corruptions of the age. His works are (1) historical and political, (2) theological and grammatical.

1. (a) Variae, the most important of all his writings, in twelve books, published in 537. They contain the decrees of Theodoric and his successors Amalasuntha, Theodahad and Wiglph, the regulations and edicts of the latter, written and collected by Cassiodorus himself when praefectus praetorio. It is the best source of our knowledge of the Ostrogothic kingdom in Italy (ed. T. Mommsen in Monumenta Germaniae Historica: Auctores Antiquissimi, xii., 1894; condensed English translation by T. Hob, 1886).

(b) Chronica, written at the request of Theodic's son-in-law Eutracian, during whose consulship (519) it was published. It is a dry and inaccurate compilation from various sources, unduly partial to the Goths (ed. T. Mommsen in Mon. Germ. Hist.: Auct. Ant. xi. pt. i. 1854), (c) Panegyrics on Gothic kings and queens (fragments ed. L. Traube in Mon. Germ. Hist.: Auct. Ant. xii).

2. (a) De Anima, a discussion on the nature of the soul, at the conclusion of which the author deprecates the quarrel between two such great peoples as the Goths and Romans. It seems to have been published with the last part of the Variae.

(b) Institutiones divinarum et humanarum litterarum, an encyclopaedia of sacred and profane literature for the monks, and a sketch of the seven liberal arts. It further contains instructions for using the library, and precepts for daily life.

(c) A commentary on the Psalms and short notes (complexeones) on the Pauline Epistles, Acts, and the Apocalypse.

(d) De Orthographia, a compilation made by the author in his ninety-third year from the works of twelve grammarians, ending with his contemporary Priscian (ed. H. Keil, Grammatici Latini, viii.).

The last work of Joseph of how the religious and ecclesiastical histories of Theodoret, Sozomen and Socrates, under the title of Historia Triparadis (embracing the years 306-439), were carried out under his supervision.

Of the greatest importance was the Historia Gothorum, written with the object of glorifying the Gothic royal house and proving that the Goths and Romans had long been connected by ties of friendship. It was published during the reign of Athalaric and dedicated to his son-in-law Belisarius, that it might be known to posterity and to posterity. With Theodoric's chief authority for Gothic history and legend was Ablavius (Ablavius). The work is only known to us in the meagre abridgment of Jordanes (ed. T. Mommsen, 1882).

CASSIOPEIA—

CASSIOPEIA—

FORNERIUS, 1895; Diodorus v. 21, 22, 38; Squillace v. 5, il. 5, 2, 5, v. 11; Pliny, Nat. Hist. iv. 119, vii. 107, xxiv. 156-158, are the chief references in ancient literature. T. R. Holmes, Ancient Britain (1907), appendix, identifies the Cassiterides with the British Isles.

CASSITERIDES (from the Gr. κασίτερος, tin, i.e. "tin islands"), in ancient geography the name of islands regarded as being situated somewhere near the west coasts of Europe. Herodotus (430 B.C.) had dimly heard of them. Later writers, Posidonius, Diodorus, Strabo and others, call them smallish islands off (Strabo says, some way off) the north-west coast of Spain, which contained tin mines, or, as Strabo says, tin and lead mines—though a passage in Diodorus derives the name rather from their nearness to the tin districts of north-west Spain. While geographical knowledge of the west was still scanty and the secrets of the tin-trade were still successfully guarded by the sea-men of Gades and others who dealt in the metal, the Greeks knew only that tin came to them by sea from the far west, and the idea of tin-producing islands easily arose. Later, when the west was better explored, it was found that tin actually came from two regions, north-west Spain and Cornwall. Neither of these could be called "small islands" or described as off the north-west coast of Spain, and so the Cassiterides were not identified with either by the Greek and Roman geographers. Instead, they became a third, ill-understood source of tin, conceived of as distinct from Spain or Britain. Modern writers have perpetuated the error that the Cassiterides were definite spots, and have made many attempts to identify them. Small islands off the coast of north-west Spain, the headlands of that same coast, the Scillies, Cornwall, the British Isles as a whole, have all in turn been suggested. But none suits the conditions. Neither the Spanish islands nor the Scillies contain tin, at least in serious quantities. Neither Britain nor Spain can be called "small islands off the north-west of Spain." It seems most probable, therefore, that the name Cassiterides represents the first vague knowledge of the Greeks that tin was found overseas somewhere in or off western Europe.

AUTHOIRS.—Hodgkin, t. 157, 165; Diodorus v. 21, 22, 38; Squillace v. 5, il. 5, 2, 5, v. 11; Pliny, Nat. Hist. iv. 119, vii. 107, xxiv. 156-158, are the chief references in ancient literature. T. R. Holmes, Ancient Britain (1907), appendix, identifies the Cassiterides with the British Isles.

CASSITERITE (from the Gr. κασίτερος, tin), the mineralogical name for tin-stone, the common ore of tin. It consists of tin dioxide, or stannic oxide (SnO₂), and crystallizes in the tetragonal system. The crystals are usually 4-sided or 8-sided prisms, striated vertically, and terminated by pyramids (fig. 1). Twins, with characteristic re-entrant angles, such as figs. 2 and 3, are common. Certain slender prismatic crystals, with an acute 8-sided pyramid, are known in Cornwall as "sparable tin," in allusion to their resemblance to sparable nails, whilst very slender crystals are termed needle-tin. Occasionally the mineral occurs in fibrous forms, which pass under the name of
in the Circus; in his third (486) he made a treaty with the conquered Herdici. The account of his agrarian law is confused and contradictory; it is clear, however, that it was intended to benefit the needy plebeians (see Agrarian Laws). As such it was violently opposed both by the patricians and by the wealthy plebeians. Cassius was condemned by the people as aiming at kingly power, and hurled from the Tarpeian rock. Another account says he was tried by the family council and put to death by his own father, who considered his proposal prejudicial to the patrician interest. According to Livy, his proposal to bestow a share of the land upon the Latins was regarded with great suspicion. According to Mommsen (Römische Forschungen, ii.), the whole story is an invention of a later age, founded upon the proposals of the Gracchi and M. Livius Drusus, to which period belongs the idea of sharing public land with the Latins.

See Livy ii. 33, 41; Dion Halic. v. 49, viii. 69-80; Cicero, Pro Balbo, 23 (53), De Republica, ii. 24 (49), 35 (60); Val. Max. v. 8. 2.

The following Cassii are all plebeians. It is suggested that the sons of Spurius Cassius either were expelled from, or voluntarily left, the patrician order, in consequence of their father’s execution.

2. GAULUS CASSIUS LONGINUS, consul 73 B.C. With his colleague, Terentius Varro Lucullus, he passed a law (lex Terentia Cassia), the object of which was to give authority for the purchase of corn at the public expense, to be resold at a fixed price at Rome. The law was received with violent hostility by this Cassius (whence his getronym, which is identical with the additional name Varus) who was proscribed by the triumvirs, and put to death at Minturnae (43). According to Orosius he was killed at the battle of Mutina.

See Cicero, In Verrem, iii. 70, 75, v. 2; Livy, Epit. 96; Appian, Bel. Civ. iv. 28; Orosius v. 24.

3. GAULUS CASSIUS LONGINUS, prime mover in the conspiracy against Julius Caesar. Little is known of his early life. In 53 B.C. he served in the Parthian campaign under M. Licinius Crassus, saved the remains of the army after the defeat at Carrhae, and for two years successfully repelled the enemy. In 49 B.C. he became tribune of the plebs. The outbreak of the civil war saved him from being brought to trial for extortion in Syria. He at first sided with Pompey, and as commander of part of his fleet rendered considerable service in the Mediterranean. After Pharsalus he became reconciled to Caesar, who made him one of his legates. In 44 B.C. he became praetor peregrinus with the promise of the Syrian province for the ensuing year. The appointment of his junior, M. Junius Brutus, as praetor urbicus deeply offended him, and he was one of the busiest conspirators against Caesar, taking an active part in the actual assassination. He then left Italy for Syria, raised a considerable army, and defeated P. Cornelius Dolabella, to whom the province had been assigned by the senate. On the formation of the triumvirate, Brutus and he, with their combined forces, crossed the Hellespont, marched through Thrace, and encamped near Philippi in Macedonia. Their object was to outflank the enemy, but they were forced into an engagement. Brutus was successful against Octavian, but Cassius, defeated by M. Antonius (Mark Antony), gave up all for lost, and ordered his freedman to slay him. He was lamented by Brutus as “the last of the Romans,” and buried at Thasos. A man of considerable ability, he was a good soldier, and took an interest in literature, but in politics he was actuated by vanity and ambition. His portrait in Shakespeare’s Julius Caesar, though vivid, is scarcely historical.

See Plutarch, Brutus, passim, Cassius, 27, 29, Caesar, 62, 69; Dio Cassius xi. 28, xii. 13, xiii. 14, xiv. 20; Vell. Pat. ii. 46, 56, 58, 65, 70, 87; Cicero, Philippics, xi. 13, 14, ad Att. v. 21, xiv. 21, ad Pro. ii. 3, 15, 16; Appian, Bel. Civ. ii. 111, 112, i. 2, 8, iv. 60-62, 87, 90, 111-113, 132; Caesar, Bell. Civ. iii. 101.

4. QUINTUS CASSIUS LONGINUS, the brother or cousin of the murderer of Caesar, quaestor of Pompey in Further Spain in 54 B.C. In 49, as tribune of the people, he strongly supported the cause of Caesar, by whom he was made governor of Caesar. He treated the provincials with great cruelty, and his
CASSIUS, AIDIVUS—CASSOCK

appointment (48) to take the field against Juba, king of Numidia, gave him an excuse for fresh oppression. The result was an unsuccessful insurrection at Corduba. Cassius punished the leaders with merciless severity, and in the course of the operations some of his troops revolted under the career of M. Marcellus, who was proclaimed governor of the province. Cassius was surrounded by Marcellus in Ulia. Bogud, king of Mauretania, and M. Lepidus, proconsul of Hither Spain, to whom Cassius had applied for assistance, negotiated an arrangement with Marcellus whereby Cassius was to be allowed to go free with the legions that remained loyal to him. Cassius sent his troops into winter quarters, hastened on board ship at Malaca with his ill-gotten gains, but was wrecked in a storm at the mouth of the Iberus (Ebro). His tyrannical government of Spain had greatly injured the caurse of Caesar.

See Dio Cassius xii. 15, 24, xiii. 15, xiii. 29: Livy, Epit. 111; Appian, B.C. ii. 33: 43: Bellum Alexandrinum, 85-94.

5. GAIUS CASSIUS LONGINUS (1st century A.D.), Roman jurist, consul in 30, proconsul of Asia 40-41, and governor of Syria under Claudius 43-50. On his return to Rome his wealth and high character secured him considerable influence. He was banished by Nero (63) to Sicily, because among the images of his ancestors he had preserved that of the murderer of Caesar. He was restored by Vespasian, and died at an advanced age. As he was consul in 30, he must have been born at the latest in the year 3 B.C. Cassius was a pupil of Maturius Sabinus, with whom he founded a legal school, the followers of which were called Cassiani. His chief work was the Liber Jus Civilis in ten books, which was used by the compilers of the Digest of Justinian.

See Tacitus, Annals, vii. 7-9; Suetonius, Nero, 37; Dio Cassius lxx. 29: Teufel-Schwa, Hist. of Roman Literature, § 298, 3.

CASSIUS, AIDIVUS (d. A.D. 175). Roman general, a Syrian by birth, lived during the reign of Marcus Aurelius. He especially distinguished himself during the Parthian War (A.D. 162-165), at the conclusion of which he was apparently appointed military governor of Asia, though the actual extent of his jurisdiction is doubtful. In 172 he was sent to Egypt, where he put down a dangerous rising of the Bucolic, and sent a robber herdsmen of the delta of the Nile, after which he returned to Syria. In 175 the emperor Aurelius fell ill, and his wife Faustina, to secure her position in case of his death, offered her hand and the throne to the successful general. A rumour of Aurelius's death having reached Syria, Cassius, without waiting for confirmation, proclaimed himself emperor; when the report proved false, it was too late for him to draw back, and he accordingly prepared for war. The senate declared him a public enemy, although Aurelius even then expressed the hope that he might have the opportunity of pardoning him. Depriving the necessity for taking up arms against his trusted officer, Aurelius set out for the east. While in Ilyria, he received the news that Cassius had been slain by his own officers. The murderers offered his head to Aurelius, who refused to admit them, and ordered its immediate burial.

See Dio Cassius lxxii. 2-4, 17, 22-28, 30, 31: Fronto, Letters, i. 6: Livy, ix. 4: Marcus Aurelius, Verus and Commodus in the Scriptores Historiae Augustae, and the special biography of Avidius Cassius in the same by Vulcacius Gallicanus. The various letters and documents in the last-named are generally considered spurious, and portions of the others founded on them consequently untrustworthily. See also article in Pauly-Wissowa's Realenzyklopädie, ii. pt. 2 (1896).

CASSIUS, GAIUS, Latin poet, general and politician, called Parmenias is from his birthplace Parma, was one of the murderers of Julius Caesar, and after his death joined the party of Brutus and his namesake Cassius the conspirator. In 43 B.C. he was in command of the fleet on the coast of Asia, but lost the battle of Philippi joined Sextus Pompeius in Sicily. When Pompeius, having been defeated in a naval engagement at Nauculich by the fleet of Octavian under Agrippa, fled to Asia, Cassius went over to Antony, and took part in the battle of Actium (31). He afterwards fled to Athens, where he was soon put to death by Octavian, whom he had offended by writing an abusive letter (Suetonius, Augustus, 4). Cassius is credited with satires, elegies, epigrams and tragedies. Some hexameters with the title Cassi

Orpheus are by Antoninus Thylaeus, an Italian of the 17th century. Horace appears to have thought well of Cassius as a poet, for he asks Tullus Cato whether he means to compete with the opuscula (probably the elegies) of Cassius (Epistles, i. 4. 3). The story in the Horace scholia that L. Varius Rufus published his famous tragedy Thyestes from an MS, which he found amongst the papers of Cassius after his death, is due to a confusion of Cassius's murderer, Q. Attius Varus, with the tragedian (Appian, B.C. v. 2, 139; Cicero, Ad Fam. xii. 13; Vell. Pat. ii. 87; Orosius, vi. 19; see also the diffuse treatise of A. Weichert, De L. Varri et Cassius Parmennis Vita et Carminibus, 1836). Cassius Parmenides must not be confused with Cassius Etruscus (Horace, Satires, i. 10. 60), an improviser, who is said to have used enough paper to furnish his funerary pyre.

CASSIVELAUNUS, or Cassivellanus, a British chieftain, ruler of the country north of the Thames, who led the native tribes against Julius Caesar on his second expedition (54 B.C.); see BRITAIN). After several indecisive engagements, Caesar took the camp of Cassivellanaus, who was obliged to make peace on condition of paying tribute and giving hostages. But these promises were not meant to be kept, and it appears certain that the tribute was never paid. According to Bede (Hist. Eccl. i. 2), the remains of Cassivellanaus's entourage were visible seven centuries later. See Caesar, B.G. v. 11-12; Dio Cassius xi. 2, 3; Orosius vi. 9: Eutropius vi. 17; Polyneaus, Strategemata, viii. 23. For the etymology of the name (which is Celtic in origin, and appears later as Casswallon) see J. Rhys, Celtic Britain, pp. 289-300 (1904); C. I. Elton, Origins of English History (1909); and Stock's edition of Caesar, De Bello Gallico (1898).

CASSOCK (Fr. casaque, a military cloak), a long-sleeved, close-fitting robe worn by the clergy and others engaged in ecclesiastical functions. The name was originally specially applied to the dress worn by soldiers and horsemen, and later to the long garment worn in civil life by both men and women. As an ecclesiastical term the word "casok" came into use somewhat later (as a translation of the old names of subtanea, vestis talaris, toga talaris, or tunica talaris), being mentioned in canon 74 of 1604; and it is in this sense alone that it now survives. The origin of the word has been the subject of much speculation. It is derived through the French from the Italian cassa, which Florio (Q. Anna's New World of Words, 1611) translates as "a frock, a horseman's cote, a long cote; also a habitation or dwelling," and it is usually held that this in turn is derived from casa, a house (cf. the derivation of "chauble," q.v.). This, however, though possible is uncertain. A Slav origin for the word has been suggested (Hatzfeld and Darmsteter, Diction. gén. de la langue française), and the Cassock horseman may have given to the West both the garment and the name. Or again, it may be derived from casaequin (Ital. casecchino), rather than vice versa, and this in turn from an Arabic kasâyand (Pers. kashyand), a padded jerkin; the word kasagdhn occurring in Mid. High Ger. for a riding-cloak, and gasygan in O. Fr. for a padded jerkin (Lagarde in Göt. gelehrte Anzeiger, April 15, 1887, p. 238).

The cassock, though part of the canonical costume of the clergy, is not a liturgical vestment. It was originally the outer- and domestic dress of lay-people as well as clergy, and its survival among the latter when the secular fashions had changed is merely the outcome of ecclesiastical conservatism. In mild weather it was the outer garment; in cold weather it was worn under the talar or chimere (q.v.); sometimes in the middle ages the name "chimere" was given to it as well as to the sleeveless upper robe. In winter the cassock was often lined with furs varying in costliness with the rank of the wearer, and its colour also varied in the middle ages with his ecclesiastical or academic status. In the Roman Catholic Church the subtanea (Fr. soutane, Ital. sottana) must be worn by the clergy whenever they appear, both in ordinary life (except in Protestant countries) and under their vestments in church. It varies in colour with the wearer's rank: white for the pope, red (or black edged with red) for cardinals, purple for bishops, black for the lesser ranks: members of religious orders, however,
CASSONE—CASTALIA

whatever their rank, wear the colour of their religious habit. In the Church of England the cassock, which with the gown is prescribed by the above-mentioned canon of 1604 as the canonical dress of the clergy, has been continuously, though not universally, worn by the clergy since the Reformation. It has long ceased, however, to be their every-day walking dress and is now usually only worn in church, at home, or more rarely by clergy within the precincts of their own parishes. The custom of wearing the cassock under the vestments is traceable in England to about the year 1400.

The old form of English cassock was a double-breasted robe fastened at the shoulder and probably girdled. The continental, single-breasted cassock, with a long row of small buttons from neck to hem, is said to have been first introduced into England by Bishop Harris of Llandaff (1739-1738). The shortened form of cassock which survives in the bishop’s “apron” was formerly widely used also by the continental clergy. Its use was forbidden in Roman Catholic countries by Pope Pius IX., but it is still worn by Roman Catholic dignitaries as part of their out-of-door dress in certain Protestant countries.

See the Report of the sub-committee of Convocation on the Ornaments of the Church and its Ministers (London, 1908), and authorities there cited.

CASSONE, in furniture, the Italian name for a marriage coffer. The ancient and once almost universal European custom of providing a bride with a chest or coffer to contain the household linen, which often formed the major part of her dowry, produced in Italy a special type of chest of monumental size and artistic magnificence. The cassoni of the people, although always large in size, were simple as regards ornament; but those of the nobles and the well-to-do mercantile classes were usually imposing as regards size, and adorned with extreme richness. The cassone was almost invariably much longer than the English chest, and even at a relatively early period it assumed an artistic finish such as was never reached by the chests of northern Europe, except in the case of a few of the royal corbeilles de mariage made by such artists as Boule for members of the house of France. Many of the earlier examples were carved in panels of geometrical tracery, but their characteristic ornament was either intarsia or gesso, or a mixture of the two. Bold and massive feet, usually shaped as claws, lions’ or other animals are also exceedingly characteristic of cassoni, most of which are of massive and sarcophagus-like proportions with moulded lids, while many of them are adorned at their corners with figures sculptured in high relief. The scroll-work inlay is commonly simple and graceful, consisting of floral or geometrical motives, or arabesques. The examples coated with gilded gesso or blazoned with paintings are, however, the most magnificent. They were often made of chestnut, and decorated with flowers and foliage in a relief which, low at first, became after the Renaissance very high and sharp. The panels of the painted cassoni frequently bore representations of scriptural and mythological subjects, or incidents derived from the legends of chivalry. Nor was heraldry forgotten, the arms of the family for which the chest was made being perhaps embazoned upon the front. These chests rarely bear dates or initials, but it is often possible to determine their history from their armorial bearings.

CASSOWARY (Casuarius), a genus of struthious birds, only inferior in size to the emu and ostrich, and, according to Sir R. Owen, approximating more closely than any other living birds to the extinct moas of New Zealand. The species are all characterized by short rudimentary wings, bearing four or five barbel-like shafts, a few inches long, and apparently useless for purposes of flight, of running, or of defence; and by loosely webbed feathers, short on the neck, but of great length on the rump and back, whence they descend over the body forming a thick hair-like covering. They possess stout limbs, with which they kick in front, and have the inner toe armed with a long powerful claw. The common cassowary (Casuarius casuarius) stands 5 ft. high, and has a horn, helmet-like protuberance on the crown of its head; the front of the neck is naked and provided with two brightly-coloured wattles. It is a native of the Island of Ceram, where it is said to live in pairs, feeding on fruits and herbs, and occasionally on small animals. The mooruk, or Bennett’s cassowary (Casuarius Bennettii), is a shorter and more robust bird, approaching in the thickness of its legs to the moas. It differs further from the preceding species in having its head crowned with a horny plate instead of a helmet. It has only been found in New Britain, where the natives are said to regard it with some degree of veneration. When captured by them shortly after being hatched, and reared by the hand, it soon becomes tame and familiar; all the specimens which have reached Europe alive have been thus domesticated by the natives. The adult bird in the wild state is exceedingly shy and difficult of approach, and, owing to its great fleetness and strength, is rarely if ever caught. It eats voraciously, and, like the ostrich, will swallow whatever comes in its way. (See EMEU.)

CAST (from the verb meaning “to throw”; the word is Scand. in origin, cf. Dan. kaste, and Swed. kasta; “cast” in Middle Eng. took the place of the A.S. weorfan, cf. Ger. werfen), a throw, or that which is thrown, or that into which something is thrown. From these three meanings come the main uses of the word; for the throwing of dice, with the figures of a chance or opportunity, as in “at the last cast”; for the throwing of a fisherman’s line in fly-fishing; for hounds spreading out in search of a lost scent; or, with the further meaning of a twisted throw or turn, for a slight squat in the eye. “Cast” is applied to a measure of herrings or other fish, being the amount taken in two hands to be thrown into a vessel, and similarly to a potter’s measure for a certain quantity of clay; in fishing, to the casting line of gut with fly attached; to the hard refuse thrown out of the crop of a bird of prey, and to the coils of earth thrown up by earth-worms. From the old method, in making calculations, of using counters, which were thus “thrown” up into a heap, is probably derived the meaning of “cast” for the “casting up” of figures in an account. Further, the word is found for a mould for the casting of metals, and more particularly for the copy of an original statue or relief taken from a mould; similarly, of fossils, for the mining filling of the empty mould left by the organism. Special uses of the word are also found in the theatrical term for the assignment of particular parts to the actors and actresses in a play, and in the many figurative senses of a type or stamp, as of features or characters.

CASTAGNO, ANDREA DEL (1390—1457), Italian painter of the Florentine school, was born in 1390, probably at Castagno, in the district of Mugello, and died in August 1457. He imitated Masaccio and the naturalists of his time in boldness of attitude, but was deficient in grace and colouring. His name was for about four centuries burdened with the heinous charge of murder; it was said that he treacherously assassinated his colleague, Domenico Veneziano, in order to monopolize the then recent secret of oil painting as practised in Flanders by the Van Eycks. This charge has, however, been proved to be an untruth; Domenico died four years after Andrea. The latter is commonly called "Andrea (or Andreino) del Impiccati" ("of the Hanged Men"); this was in consequence of his being commissioned in 1435, by the Prior of the Church of San Miniato in Florence, for the fallen leaders of the Peruzzi and Albizzi—not (as currently said) the men of the Pazzi conspiracy, an event which did not occur until 1478, long after this painter’s death. One of his principal works now extant (most of them have perished) is the equestrian figure of Nicola di Tolentino, in the cathedral of Florence.

CASTALIA, or FONS CASTALIUS, a celebrated fountain in Greece, now called the Fountain of St John, which rises in a chasm of Mount Parnassus, in the neighbourhood of Delphi. It was sacred to Apollo and the Muses, and its water was used in the religious purifications of the "Pythian Pilgrims." From its connexion with the Muses it is sometimes referred to by late Greek writers (e.g. Lucian, Jup. Trag. 30) and Latin poets (e.g. Ovid, Am. i. 15. 36) as a source of inspiration, and this has passed into a commonplace of modern literature. According to some authorities the nymph Castalia was the daughter of Achenius; according to others the water of the spring was derived from the Boeotian Cephissus.
CASTANETS—CADE

CASTANETS (Fr. castagnettes, Ger. Kastagnetten, Span. castañuelas), instruments of percussion, introduced through the Moors by way of Spain into Europe, which the East used for making the rhythm in dancing. Castanets are always held in pairs, one in each hand, consisting of two pear or musel-shaped bowls of hard wood, hinged together by a silk cord, the loop being passed over the thumb and first finger. The two halves are then struck against each other by the other fingers in single, double or triple beats, giving out series of hollow clicks of indefinite musical pitch. When intended for use in the orchestra the pair of castanets is mounted one at each end of a wooden stick about 8 in. long, which facilitates the playing. Castanets are also sometimes used in military bands and are then specially constructed. The two halves are kept open by a slight spring fixed to a frame attached to the hoop of a side drum, and the instrument is worked by the drummer with an ordinary drumstick. An instance of the use of castanets in opera occurs in the Habanera in Carmen. A quaint description of castantins is given in the Harleian MS. 2034 (f. 208) at the British Museum (before 1688) with a pencil sketch which tallies very well with the above. The MS. is by Randle Holme and forms part of the Academy of Armoy. Castanets (κρυθῆκα) were used by the ancient Greeks, and also by the Romans (Lat. crotalum, crotala) to accompany the dances in the Dionysiac and Bacchalian rites.

CADE (through the Fr. from Sp. and Port. casta, lineage, Lat. castus, pure). There are not many forms of social organization on a large scale to which the name "caste" has not been applied in a good or in a bad sense. Its Portuguese origin simply suggests the idea of family; but before the word came to be extensively used in modern European languages, it had been for some time identified with the Brahmanic division of Hindu society into classes. The corresponding Hindu word is tarna, or colour, and the words gati, kula, gotra, pravara and karana are also used with different shades of meaning. Wherever, therefore, a writer has seen something which reminds him of any part of the extremely indeterminate notion, Indian caste, he has used the word, without regard to any particular age, race, locality or set of social institutions. Thus Palgrave1 maintains that the colleges of operatives, which inscriptions prove to have existed in Britain during the Roman period, were practically castes, because by the Theodosian code the son was compelled to follow the father's employment, and marriage into a family involved adoption of the family employment. But these collegia opificum seem to be just the forerunners of the voluntary associations for the regulation of industry and trade, the frith-gilds, and craft-gilds of later times, in which, no doubt, sons had great advantages as apprentices, but which admitted qualified strangers, and for which intermarriage was a matter of social feeling. The history of the formation of gilds shows, in fact, that they were really protests against the authoritative regulation of life from without and above. In the Saxon period, at any rate, there was nothing resembling caste in the strict sense. "The squire who had thriven so well as to have five hides of land rose to the rank of a thegn; his wardled became 1200 shillings; the value of his oath and the penalty of trespass against him increased in proportion; his descendants in the third generation became geat-though. Nor was the character of the thriving defined; it might, so far as the terms of the custom went, be either purchase, or inheritance, or the receipt of royal bounty. The successful merchant might also thrive to thegn-right. The thegn himself might also rise to the rank, the estimation and status of an earl."2 It has been said that early German history is, as regards this matter, in contrast with England, and that true castes are to be found in the military associations (Genossen-schaften) which arose from the older class of Dienstmannen, and in which every member—page, squire or knight—must prove his knightly descent; the Bauernstand, or rural non-military population; in the Bürgerstand, or merchant-class. The Ministry of the Catholic Church in the West, was, however, never restricted by blood relation. There is no doubt that at some time or other professions were in most countries hereditary. Thus Prescott3 tells us that in Peru, notwithstanding the general rule that every man was his own master and that a man did not gauge his standing in the social ladder according to his wealth, yet "there were certain individuals carefully trained to those occupations which minister to the wants of the more opulent classes. These occupations, like every other calling and office in Peru, were fixed to father to son. The division of castes was in this particular as precise as that which existed in Hindustan or Egypt." Again, Zurita4 says that in Mexico no one could carry on trade except by right of inheritance, or by public permission. The Fiji carpenters form a separate caste, and in the Tonga Islands all the trades, except tattoo-markers, barbers and club-carvers are hereditary,—the separate classes being named matabooles, mooas and toonas. Nothing is more natural than that a father should teach his son his handicraft, especially if there be no organized system of public instruction; it gives the father help at a cheap rate, it is the easiest introduction to life for the son, and the custom or reputation of the father as a craftsman is often the most important legacy he has to leave. The value of transmitted skill in the simple crafts was very great; and what was once universal in communities still survives in outlying portions of communities which have not been brought within the general market of exchange. But so long as this process remains natural, there can be no question of caste, which means that the adoption of a new profession is not made against the wishes of the parent. The idea of caste has been applied to sacred corporations. A family or a tribe is consecrated to the service of a particular altar, or all the altars of a particular god. Or a semi-sacred class, such as the Brehons or the Bards, is formed, and these, and perhaps some specially dignified professions, become hereditary, the others remaining free. Thus in Peru, the priests of the Sun at Cuzco transmitted their office to their sons; so did the Quipu-camayoo, or public registrars, and the amantes and haraceos, the learned men and singers.5 In many countries political considerations, or distinctions of race, have prevented intermarriage between classes. Take, for example, the patricians and the plebeians at Rome, or the Spartates, Akhives or Zerek, and the Ethnêxes at Sparta. In Guatemala it was the law that if any noble married a plebeian woman he should be degraded to the caste of mazegual, or plebeian, and be subject to the duties and services imposed on that class, and that the bulk of his estate should be sequestered to the king.6 In Madagascar marriage is strictly forbidden between the four classes of Nobles, Hovas, Zarahovas and Andevos,—the lowest of whom, however, are apparently mere slaves. In a sense slavery might be called the lowest of castes, because in most of its forms it does permit some social contact, but this is not so with the class below. In a sense also, the privilege in the Indian royal family is that of "equality of birth." (Ebenbürgerlichkeit) is that of a caste conception, and the marriage of one of the members of the European royal family with a person not of royal blood might be described as an infraction of caste rule.

Caste in India is a question of more than historical interest. It is the great obstacle to government in accordance with modern

1. History of Peru, i. 143.
3. Something like this is to be found in the Russian notion of chin, or status according to official hierarchy of ranks, as modified by the custom of myestnichestvo, by which no one entering the public service could be placed beneath a person who had been subject to his father's orders. Hereditary nobility at one time belonged to every servant, and it is only in the last century or two that the city life of the court has been cut off from social privilege by the privilege of inheriting office for two generations lost its rights of nobility; but in 1854 the privilege was confined to army colonels and state councillors of the 4th class. At one time, therefore, the rasvaydnyiya kniya, or special regalia worn by the nobles, was the key to the privileged class. Peter's "label o rangzakh" contained fourteen classes. The subject is treated of in the 1600 articles of the ninth volume of the Russian Code. See Zagoskin's The Russian Nobility, through de-
ideas, and to the work of native religious reformers as well as of Christian missionaries. By some writers caste has been regarded as the great safeguard of social tranquillity, and therefore as the indispensable condition of the progress of certain arts and industries which the Hindus have made. Others, such as James Mill, have denounced it as fatal to the principle of free competition and opposed to individual happiness. The latter view assumes a state of facts which was denied by Colebrooke, one of the highest authorities on Indian matters. Writing in 1798 he says, after pointing out that any person unable to earn a subsistence by the exercise of his profession may follow the trade of a lower caste or even of a higher: "Daily observation shows even Brahmins exercising the menial profession of a Sudra. We are aware that every caste forms itself into clubs or lodges, consisting of the several individuals of that caste residing within a small distance, and that these clubs or lodges govern themselves by particular rules or customs or by-laws. But though some restrictions and limitations, not founded on religious prejudices, are found among their by-laws, it may be received as a general maxim that the occupation appointed for each tribe is entitled merely to a preference. Every profession, with few exceptions, is open to every description of persons; and the discouragement arising from religious prejudices is not greater than what exists in Great Britain from the effects of municipal and corporation laws. In Bengal the numbers of people actually willing to apply to any particular occupation are insufficient for the unlimited extension of this character." This was corroborated by Elphinstone, who states that, during a long experience of India, he never heard of a single case of degradation from caste; and it is illustrated by the experience of the Indian army, in which men of all castes unite.

The ordinary notion of modern caste is that it involves certain restrictions on marriage, on profession, and on social intercourse, especially that implied in eating and drinking together. How far intermarriage is permitted, what are the effects of a marriage permitted but looked on as irregular, what are the penalties of a marriage forbidden, whether the rules protecting trades and occupations are in effect more than a kind of unionism grown inerterate through custom, by what means caste is lost, and in what circumstances it may be regained,—these are questions on which very little real or definite knowledge exists. Sir H. Risley regards the absolute prohibition of mixed marriages as now the essential and most prominent characteristic. It is very remarkable that the Vedas, on which the whole structure of Brahmanic faith and morals professes to rest, give no countenance to the later regulations of caste. The only passage bearing on the subject is in the Purusha Sukta, the 90th Hymn of the 10th Book of Rig Veda, in the Samhita. "When they divided men, how many did they make him? What was his mouth? What was his mouth? What were his limbs? what were his fingers in his hands? The Brahmana was his mouth, the Raganya was made his arms, the Vaisya became his thighs, the Sudra was born from his feet." Martin Haug finds in this a subtle allegory that the Brahmanas were teachers, the Kshatriyas the warriors of mankind. But this is opposed to the simple and direct language of the Vedic hymns, and to the fact that in the accounts of creation there the origin of many things besides classes of men is attributed in the same fanciful manner to parts of the divine person. It is in the Puranas and the Laws of Manu, neither of which claims direct inspiration, where they differ from the letter of the Veda, that the texts that are on what all that is objectionable in caste has been based. Even in the Vishnu Purana, however, the legend of caste speaks of the caste as "perfectly inclined to conduct springing from religious faith." It is not till after the whole human race has fallen into sin that separate social duties are assigned to the classes. The same hymn speaks of the evolution of qualities of Brahma. Sattva, or goodness, sprang from the mouth of Brahma; Rajas, or passion, came from his breast; Tamas, or darkness, from his thighs; others he created from his feet. For each one of these, or primitive differences of quality, a thousand couples, male and female, have been created, to which the distinct heavens, or places of perfection of Prajapati, Indra, Maruts and Gandharvas are assigned. To the gunas are related the yugas, or ages: 1st, the Krita, or glorious age of truth and piety, in which apparently no distinctions, at least no grades of excellence were known; 2nd, the Treta, or period of knowledge; 3rd, the Dvapara, or period of sacrifice; 4th, the Kali, or period of darkness. Bunsen supposes there may have been an historical element in the legend that Pururava, a great conqueror of the Treta age, founded caste. The yugas are hardly periods of historical chronology, but there is no doubt that the Vayu Purana assigns the definite origin of caste to the Treta period. "The perfect beings of the first age, some tranquil, some fiery, some active and some distressed, were again born in the Treta, as Brahmas, &c., governed by the good and bad actions performed in the Treta age." Thus the system proceeds to explain that the first arrangement did not work well, and that a second was made, by which force, criminal justice and war were declared to be the business of the Kshatriyas; officiating at sacrifices, sacred study and the receipt of presents to belong to the Brahmans; traffic, cattle and agriculture to the Vaisyas; the mechanical arts and service to the Sudras. The Ramayana hymn suggests that in the four great periods the castes successively arrive at the state of dharma or righteousness. Thus, a Sudra cannot, even by the most rigorous self-mortification, become righteous in the period proper to the salvation of the Vaisyas. As the hymn speaks in the Dvapara age, it speaks of the salvation of Sudras as future, and not yet possible. Wholly in opposition to the story of a fourfold birth from Brahma is the legend that the castes sprang from Manu himself, who is removed by several generations of gods and demi-gods from Brahma. Then, again, the Santi-parvan alleges that the world, at first entirely Brahmanic, was separated into castes merely by the evil works of man. Castehood consists in the exercise of certain virtues or vices. Manus, or persons born indiscriminately, frequently rise to the caste of Brahmans, and the offspring of Brahman sink to a lower level. The serpent observes: "If a man is regarded by you as being a Brahman only in consequence of his conduct, then birth is vain, until action is shown." But this change of caste takes place only through a second birth, and not during the life which is spent in virtue. Another poetical conception of caste birth is expressed in the Harivamsa. The Brahmanas were formed from an imperishable element (Akshara), the Kshatriyas from a perishable element (Kshara), the Vaisyas from alteration, and the Sudras from a modification of smoke.

The general result of the foregoing texts is that several contradictory accounts have been given of the origin of caste, and that these are for the most part unintelligible. Caste is described as a late epoch in creation, and as born from different parts of different gods, from the mortal Manu, from abstract principles, and from non-entity. It is also described as coeval with creation, as existing in perfection during the Krita period, and subsequently falling into sin. It is also said that only Brahmanas existed at first, the others only at later periods. Then the rationalistic theories of the Sanskrit RVUP the very foundation of caste, viz. hereditary transmission of the caste character. It seems clear that when the Vedas were composed, many persons who were not Brahmanas acted as priests, and saints, the "preceptors of gods," by their "austere fervour," rose from a lower rank to the dignity of Brahmanhood. Originally, indeed, access to the gods by prayer

1 Life and Essays of H. T. Colebrooke, i. p. 104.
2 History of India.
3 The cruelties and cruelties of the caste system need not blind us to its other aspects. There is no doubt that it is the main cause of the fundamental stability and contentment by which Indian society has been braced for centuries against the shocks of politics and the cataclysms of Nature. It provides every man with his post in life, his career, his occupation, his circle of friends. It makes him, at the outset, a member of a corporate body: it protects him through life from the canker of social jealousy and unfulfilled aspirations: it ensures him companionship and a sense of community with others in like case with himself. The caste organization is to the Hindu his club, his trade union, his benefit society, his philanthropic society. An Indian without caste, as things stand at present, is not quite easy to imagine." (Sidney Low, Vision of India, 1906, ch. xv. p. 263.)

4 Muri's Sanskrit Texts, v. i. (1868).
and sacrifice was open to all classes of the community. As the Brahmans grew in political importance, they made religion an exclusive and sacred business. We find them deciding questions of succession to the throne, and enforcing their decisions. While in the earlier literature there are several instances of Brahmans receiving instruction from the hands of Kshatriyas, in the Puranas and Manu death is made to overtake Kshatriyas who are not submissive to the Brahmans; and in one case Visvamitra, the son of Gaddi, actually obtains Brahmanhood as a reward for his submission. It seems certain that many of the ancient myths were expressly manufactured by the Brahmans to show their superiority in birth and in the favour of Heaven to the Kshatriyas —a poetical effect which is sometimes spoiled by their claiming descent from their rivals. This brings us to a consideration of the theories which have been started to account for the appearance of Brahmanic caste, as it is stereotyped in the Laws of Manu. James Mill, who invariably underestimated the influence on history of "previous states of society, suggested that the original division must have been the work of some inspired individual, a legislator or a social reformer, who perceived the advantages which would result from a systematic division of labour. But this explanation is not satisfactory, and the superstitious terror and the designing lust of power which have so frequently been invoked to explain the natural supremacy of the religious class. Because the ravages of war were dreaded most after the calamities sent by heaven, he finds that the military class properly occupy the second place. This arrangement he apparently contemplates as at no time either necessary or wholesome, and as finally destroyed by the selfish jealousies of caste, and by the degradations which the multiplication of trades made inevitable. Heeren and Klaproth have contended that the division into castes is founded on an original diversity of race, and that the higher castes are possessed of superior beauty. The clear complexion and regular features of the Brahmans are said to distinguish them as completely from the Sudras as the Spanish Creoles were distinguished from the Peruvians.

"The high forehead, stout build, and light copper colour of the Brahmins and other castes allied to them, appear in strong contrast with the somewhat low and wide heads, slight make, and dark bronze of the low castes" (Stevenson, quoted by Max Müller, Chips, ii, p. 327). This explanation is, however, generally conjoined with that founded on the tradition of conquest by the higher castes. There is no doubt that the three castes of lighter colour (traivarnika), the white Brahmans, the red Kshatriyas, the yellow Vaisyas, are, at least in the early hymns and Brahmas, spoken of as the Aryas, the Sanskrit-speaking conquerors, in contradistinction to the dark cloud of the Turanian aborigines Dasyus.

In fact Aryan, which means noble, is derived from ārya, which means household, and was the original name of the largest caste, now called Vaisyas. The great Sanscrit scholar, Rudolf von Roth (1821-1893), in his Brahman und die Brahmanen held that the Vedic people advanced from their home in the Punjab, drove the aborigines into the hills, and took possession of the country between the Ganges, the Jumna and the Vindhyas range. "In this stage of complication and disturbance," he said, "power naturally fell into the hands of those who did not possess any direct authority," i.e. the domestic priests of the numerous tribal kings. The Sudras he regarded as the conquered race, perhaps a branch of the Aryan stock, which immigrated at an earlier period into India, perhaps an autochthonous Indian tribe. The latter hypothesis is opposed to the fact that, while the Sudra is debarred from sharing three important Vedic sacrifices, the Brahmanic Pythian expressly permits them to sacrifice "without mantras," and imposes on him duties with reference to Brahmans and cows which one would not expect in the case of a nation strange in blood. But unless a previous subordination of castes among the conquering race be supposed, it seems difficult to see why the warrior-class, who having contributed most to the conquest must have been masters of the situation, should have consented to degradation below the class of Brahmans. The position of the Sudra certainly suggests conquest. But are there sound historical reasons for supposing that Brahmans and Sudras belonged to different nations, or that either class was confined to one nation? The hypothesis was held in a somewhat modified form by Meiners, who supposed that instead of one conquest there may have been two successive immigrations,—the first immigrants being subdued by the second, and then forming an intermediate class between their conquerors and the aborigines; or, if there were no aborigines, the mixture of the two immigrant races would form an intermediate class. In the same way Talboys Wheeler suggested that the Sudra was an original race of the place, the Arapaho, represented by the Pariah. Most of these explanations seem rather to describe the mode in which the existing institutions of caste might be transplanted from one land to another, from a motherland to its colonies, and altered by its new conditions. Military conquest, though it often introduces servitude, does not naturally lead to the elevation of the priesthood. It is unsatisfactory to assume large historical events, or large ethnological facts, or the existence of some creator of social order.

As Benjamin Constant points out, caste rests on the religious idea of an indelible stain resting on certain men, and the social idea of certain functions being committed to certain classes. The idea of physical purity was largely developed under the Mosaic legislation; in fact the internal regulations of the Essenes (who were divided into four classes) resemble the frivolous prohibitions of Brahmanism. As the daily intercourse of men in trade and industry presents numberless occasions on which the stain of real or fancied impurity might be caught, the power of the religious class who define the rules of purity and the penalties of their violation becomes very great. However, the Hindus are deeply religious, and therefore naturally prepared for Purohit or priest-rule. They were also passionately attached to their national hymns, some of which had led them to victory, while others were associated with the benign influences of nature. Only the priest could chant or teach these hymns, and it was believed that the smallest mistake in pronunciation would draw down the anger of the gods. But however favourable the conditions of spiritual dominion might be, it seems to have been by no more natural process than hard fighting that the Brahmans finally asserted their supremacy. We are told that Parasurama, the great hero of the Brahmanas, "cleared the earth thrice seven times of the Kshatriya caste, and filled with their blood the five large lakes of Samauta." Wheeler thinks that the substitution of blood-sacrifices for offerings of parched grain, clarified butter and soma wine marks an adaptation by the Brahmanas of the great military duties to the purposes of political supremacy. It is, therefore, till the Brahmanic period of Indian history, which ends with the coming of Sakya Muni, in 600 B.C., that we find the caste definitions of Manu realized as facts. These are—"To Brahmanas he (i.e. Brahma) assigned the duties of reading

2 The idea of conquering white race is strangely repeated in the later history of India. The Rajputs and Brahmas are succeeded by the Mussulmans, the Turks, the Afghans. There was an aristocracy of colour under the Mogul dynasty. But under an Indian climate it could not last many generations. The Brahmas of southern India have been overlaid by the lowest castes; the Chandalas or outcastes were descended from Brahmas. According to Manu the Chandalas must not dwell within town; his sole wealth must be dogs and asses; his clothes must consist of the mantles of deceased persons; his dishes must be broken pots. Surely this vituperative description must apply to an aboriginal race.

6 For a characteristic appreciation of caste see Comte, Cours de philosophie positive, vi. c. 8. He regards the hereditary transmission of functions under the rule of a sacerdotal class as a necessary and conservative good, and speaks of the humanism of the Brahman as a direct result of colonization. The morality of caste was, he contends, an improvement on what preceded; but its permanence was impossible, because the "political rule of intelligence is hostile to human progress." The seclusion of women and the preservation of industrial inventions were features of caste; and the higher priests were also magistrates, philosophers, artists, engineers, and physicians.
the Vedas, of teaching, of sacrificing, of assisting others to sacrifice, of giving alms if they be rich, and if indigent of receiving gifts. 11 The duties of the Kshatriya are "to protect the people, to give alms, to sacrifice, to read the Veda, to shun the allures of sensual gratification." The duties of a Vaisya are "to keep herds of cattle, to bestow largesses, to sacrifice, to read the scripture, to carry on trade, to lend at interest, and to cultivate land." These three castes (the twice born) wear the sacred thread. The one duty of a Sudra is "to serve the forementioned classes without depreciating their worth." 12 The Brahman is entitled by primogeniture to the whole universe; he may eat no flesh but that of victims; he has his peculiar clothes. He is bound to help military and commercial men in distress. He may seize the goods of a Sudra, and whatever the latter acquires by labour or succession beyond a certain amount. The Sudra is to serve the twice born; and even when emancipated cannot be anything but a Sudra. He may not learn the Vedas, and in sacrifice he must omit the sacred texts. A Sudra in distress may turn to a handicraft; and in the same circumstances a Vaisya may stoop to service. Whatever crime a Brahman might commit, his person and property were not to be injured; but whoever struck a Brahman with a blade of grass would become an inferior quadruped during twenty-one transmigrations. From his youth the Brahman was a scholar: he was the raja's priest, exempt from taxation, the performer of public sacrifices, the expounder of Manu, and at one time the physician of bodies as well as of souls. He is more liable than less holy persons to pollution, and his ablutions are therefore more frequent. A Kshatriya who slandered a Brahman was to be fined 100 panas (a copper weight of 200 grains); a Vaisya was fined 200 panas; a Sudra was to be whipped. A Brahman slandering any of the lower castes pays 50, 25 or 12 panas. In ordinary salutations a Brahman is asked whether his devotion has prospered; a Kshatriya, whether he has suffered from his wounds; a Vaisya whether his health is secure; a Sudra whether he is in good health. 3 In administering oaths a Brahman is asked to swear by his vertity; a Kshatriya by his weapons, house or elephant; a Vaisya by his kine, grain or goods; a Sudra by all the most frightful penalties of perjury. The Hindu mind is fertile in oaths; before the caste assembly the Dhurm, or caste custom, is sometimes appealed to, or the feet of Brahma, or some cow or god or sacred river, or the bell (the sacred creeper), or the roots of the turmeric plant. The castes are also distinguished by their modes of marriage. Those peculiar to Brahmans seem to be—first, a Brahman's daughter, when dressed only with a single robe, is given to a man learned in the Veda whom her father has voluntarily invited and respectfully receives; and, Devas or Daiva, when a daughter, in gay attire is given, when the sacrifice is already begun, to the officiating priest. The primitive marriage forms of Rassas or Rachass, when a maiden is seized by force from home, while she weeps and calls for help, is said to be appropriate to Kshatriyas. To the two lower castes the ceremony of Asura is open, in which the bridegroom, having given as much wealth as he can afford to the father and paternal kinsman and to the damsel herself, takes her voluntarily as his bride. A Kshatriya woman on her marriage with a Brahman must hold an arrow in her hand; a Vaisya woman marrying one of the sacerdotal or military classes must hold a whip; a Sudra woman marrying one of the upper castes must hold the skirt of a mantle.

How little the system described by Manu applies to the existing castes of India may be seen in these facts—(1) that there is no artisan caste mentioned by Manu; (2) that eating with another caste, or eating food prepared by another caste, is not said by him to involve loss of caste, though these are now among the most frequent sources of degradation. The system must have been profoundly modified by the teaching of Buddha: "As the four rivers which fall into the Ganges lose their names as soon as they mingle their waters with the holy river, so all who believe in Buddha cease to be Brahmans, Kshatriyas, Vaisyas, and Sudras." After Buddha, Sudra dynasties ruled in many parts of India, and under the Mogul dynasty the Ceyots, a race of Sudras, had almost a monopoly of public offices. But Buddha was "at variance with his caste and with those of the Sudras. That it is related that a Brahman Pandit who had embraced the doctrines of Buddha nevertheless found it necessary, when his king touched him, to wash from head to foot. 4 Alexander the Great found no castes in the Punjab, but Megasthenes had left an account of the ryots and traders, the military order and the gymnosophists (including the Buddhist Germans) whom he found in the country of the Ganges. 5 From his use of the word gymnosophist it is probable that Megasthenes confounded the Brahmins with the hermits or fakirs; and this explains his statement that any Hindu might become a Brahman. Megasthenes spent some time at the court of Sandraccottus (Chandragupta Maurya), a contemporary of Seleucus Nicator. All the later Greeks 6 follow his statement and concur in enumerating seven Indian castes—sophsists, agriculturists, herdsmen, artisans, warriors, inspectors, councillors. On the revival of Brahmanism it was found that the second and third castes had disappeared, and that the field was now occupied by the Brahmans, the Sudras, and a host of mixed castes, sprung from the original twelve, the Manu, and Pratitum, left-hand and right-hand, which were formed by the crossing of the four original castes. Manu himself gives a list of these castes, and the Ain-i-Akbari (1556-1605) makes the positive statement that there are 300 tribes bearing the name of Kshatriya, while the real caste no longer existed. Most of these subdivisions are really trade-organizations, many of them living in village-communities, which trace descent from a pure caste. Thus in Bengal there are the Vaidya or Baidya, the physicians, who, Manu says, originated in the marriage of a Brahman father and a Vaisya mother. As Colebrooke said, Brahmans and Sudras enter into all trades, but Brahmans (who are profoundly ignorant even of their own scriptures) have succeeded in maintaining their monopoly of Vedic learning, which really means a superficial acquaintance with the Puranas and Manu. Though they have succeeded in excluding others from sacred employment, only a portion of the caste are actually engaged in religious ceremonies, in sacred study, or even in religious begging. Many are privates in the army, many water-carriers, many domestic servants. And they have, like other castes, many subdivisions which prevent intimate association and intermarriage. The ideal Brahman is gone: the priest with his head and beard clipped, his passions subdued, his mantle white, his body pure, golden rings in his ear. But the bold which caste has on the Hindu mind does perhaps, be most clearly seen in the history of the Christian missions and in comparatively recent times.

1 Travels of Fuh Hian, c. 27. 2 Strabo, Ind. iv. c. 59. 3 Arrian, Ind. c. 11, 12; Diod. Sic. ii. c. 40, 41; and Strabo xv. 1.
Nobili did everything but become Brahmans in order to convert
the south of India; they put on a dress of cavy or yellow colour,
they made frequent ablutions, they lived on vegetables and milk,
they put on their foreheads the sandalwood paste used by the
Brahmans—and Gregory XV. published a bull sanctioning
caste regulations in the Christian churches of India. The
Danish mission of Tranquebar, the German mission of the heroic
Schwarz, whose headquarters were Tanjore, also permitted caste
to be retained by their followers. Even the priests of Buddha,
whose life was a protest against caste, re-erected the system in
the island of Ceylon, where the radis or radius were reduced to
much the same state as the Parias.1 Protestant missions have
made but little progress, even in recent years. The number of
native converts to Christianity rose from 1,246,000 in 1872
to 2,664,000 in 1901; these figures, however, are by themselves
rather misleading, for Christianity appears to have touched
the higher classes in India not at all, only the out-castes.

It is still the general law that to constitute a good marriage
the parties must belong to the same caste, but to unconnected
families. Undoubtedly, however, the three higher castes were
always permitted to intermarry with the caste next below their
own, or the house taking the lower caste or sometimes forming a new
caste. A Sudra need not marry a wife of the same caste or sect as
himself. In 1871 it was decided by the judicial committee of
the privy council that a marriage between a zemindar (land-
owner) of the Malavar class, a subdivision of the Sudra caste,
with a woman of the Vellala class of Sudras is lawful. Generally
also a woman may not marry beneath her own caste. The feeling
is not so strong against a man marrying even in the lowest caste,
for Manu permits the son of a Brahman and a Sudra mother
to raise his family to the highest caste in the seventh generation.
The illegitimacy resulting from an invalid marriage does not
render incapable of caste; at least it does not so disqualify the
lawful children of the bastard. On a forfeiture of caste by either
spouse intercourse ceases between the spouses: if the out-caste
be a sonless woman, she is accounted dead, and funeral rites
are performed for her; if she have a son, he is bound to maintain
her. It is remarkable that the professional concubinage of the
dancing-girl does not involve degradation, if it be with a person
of the same caste. This suggests that whatever may be the
function of caste, it is not a safe guardian of public morality.
The rules as to prohibited degrees in marriage used to be very
strict, but they are now relaxed. An act of 1856 legalized re-
marrriage by widows in all the castes, with a conditional forfeit-
ure of the deceased husband’s estate, unless the husband has
expressly sanctioned the second marriage. The later Indian
Marriage Act was directed against the iniquitous child marriages;
it requires a minimum age. In many ways the theoretical
inferiority of the Sudra absolves him from the constraints
which the letter of the law lays on the higher castes. Thus a
Sudra may adopt a daughter’s or sister’s son, though this is
counter to the general rule that the adopter should be able to
marry the mother of the adopted person. The rule requiring the
person adopted to be of the same caste and gotra or family as the
adopter is also dispensed with in the case of Sudras. In fact, it is
only in the case of the Brahman that a Sudra may not adopt. As regards
inheritance the Sudra does not come off so well in competition
with the other castes.

"The sons of a Brahmana in the several
tribes have four shares or three or two or one; the children of a
Kshatriya have three portions or two or one; and those of a
Vaisya take two parts or one." This refers to the case per-
mitted by law, and not unknown in practice, of a Brahman
having four wives of different castes, a Kshatriya three, and so
on. But all sons of inferior caste are excluded from property
coming by gift to the father; and a Sudra son is also excluded
from land acquired by purchase. It must be recollected, how-
ever, that under an act of 1850, loss of caste no longer affects the
capacity to inherit or to be adopted. In cases of succession
ab intestato on failure of the preceptor, pupil, and fellow-student
(heads called by the Hindu law after relatives), a priest, or any
Brahman, many succeed. Where a Sudra is the only son of a
1 Irving, Theory and Practice of Caste (London, 1859).

Brahman, the Sapinda, or next of kin, would take two-thirds
of the inheritance; where he is the only son of any other twice-
born father, the Sapinda would take one-half. Possibly, the rule
of equal division among sons of equal caste did not at first apply
to Brahmans, who, as the eldest sons of God, would perhaps
observe the custom of primogeniture among themselves. On the
other hand it was laid down in the judicial committee in 1869,
counter to the collected opinions of the Pundits of the Sudder
court, that, in default of lawful children, the illegitimate children
of the Sudra caste inherit their putative father’s estate, and, even
if there be lawful children, are entitled to maintenance out of the
estate. It had previously been decided by Sir Edward Ryan in
1857 that the illegitimate children of a Rajput, or of any other
member of a superior caste, have no right of inheritance even
under will, but a mere right to maintenance, provided the children
are docile. It seems then that the Kshatriya and Vaisya castes,
though in one sense non-existent, still control Hindu succession.

With regard to Persia the Zend Aesesta speaks of a fourfold
division of the ancient inhabitants of Iran into priests, warriors,
agriculturists and artisans; and also of a sevenfold division corres-
ponding to the seven amshaspands or divinities of Zoroastrian.
This was no invention of Zoroaster, but a tradition from the golden
age of Jemshid or Demshid. The priestly caste of Magi was
divided into Herods or disciples, Mobeds or masters, and Destur
Mobeds or complete masters. The last-named were alone entitled
to read the liturgies of Ormuzd; they alone predicted the future
and carried the sacred costi, or girdle, hasan, or cup, and barsom,
or bunch of twigs. The Zend word barsoma is supposed to be
connected with Brahma, or sacred element, of which the symbol
was a bunch of kusa grass, generally called veda. The Persian
and Hindu religions are further connected by the ceremony
called Homa in the one and Soma in the other. Haug, in his
Tract on the Origin of Brahmanism (quoted by Muir, ubi supra),
maintains that the division in the Zend Aesesta of the followers
of Ahura Mazda into Atharvas, Rathaesvas, and Vastrya was
precisely equivalent to the three superior Indian castes. He
also asserts that only the sons of priests (Atharvas) could become
priests, a rule still in force among the Parsees. The Book of Daniel
rather suggests that the Magi were an elective body; and as
regards the secular classes there does not seem to be a trace of
hereditary employment or religious subordination. There is
a legend in the DBastian of a great conqueror, Mahabab, who
divided the Abyssinians into the usual four castes; and Strabo
mentions a similar classification of the Iberians into kings, priests,
soldiers, husbandmen and menials.

At one time it was the universal opinion that in Egypt there
were at least two great castes, priests and warriors, the functions
of which were transmitted from father to son, the minor pro-
fessions grouped under the great castes being also subject to
hereditary transmission. This opinion was held by Otfried
Müller,2 Meiners of Gottingen, and others. Doubts were first
suggested by Rossellini, and after Champollion had deciphered
the hieroglyphic inscriptions, J. J. Ampère3 boldly announced
that there were in Egypt no castes strictly so called; that in
particular the professions of priest, soldier, judge, &c., were not
hereditary; and that the division of Egyptian society was merely
that which is generally found in certain stages of social growth
between the liberal professions and the mechanical arts and
trades. No difference of colour, or indeed of any feature, has been
observed in the monumental pictures of the different Egyptian
castes. From an inspection of numerous tombs, sarcophagi,
and funeral stones, which frequently enumerate the names and
professions of several kinsfolk of the deceased, Ampère concluded
that sacerdotal and military functions were sometimes united
in the same person, and might even be combined with civil
functions; that intermarriage might certainly take place between
the sacred and military orders; and that the members of the
same natural family did frequently adopt the different occupations
which had been supposed to be the exclusive property of the
castes. The tombs of Bent Hassan show in a striking manner the

CASTEL—CASTELAR Y RIPOLL 469

Egyptian tendency to accumulate, rather than to separate, employments. Occasionally families were set apart for the worship of a particular divinity. An interesting "sacerdotal" society is afforded by a granite monument preserved in the museum at Naples. Nine figures in bas-relief represent the deceased, his father, three brothers, a paternal uncle, and the father and two brothers of his wife. Another side contains the mother, wife, wife's mother and maternal aunt. The deceased is described as a military officer and superintendent of buildings; his elder brother as a priest and architect; his third brother as a provincial governor, and his father as a priest of Ammon. The family of the wife is exclusively sacerdotal. Egyptian caste, therefore, permitted two brothers to be of different castes, and one person to be of more castes than one, and of different castes from those to which his father or wife belonged. The lower employments, commerce, agriculture, even medicine, are never mentioned on the tombs. The absolute statements about caste in Egypt, circulated by such writers as Reynier and De Goguet, have, no doubt, been founded on passages in Herodotus (ii. 143, 164), who mentions seven classes, and makes war an hereditary profession; in Dioscorides (ii. 28), who mentions five castes and a hereditary priesthood; and in Plato, who, in the Phaidon, endeavours to illustrate the principle of compulsory division of labour, on which his republic was based, speaks in the _Timaeus_ of a total separation of the six classes—priests, soldiers, husbandmen, artisans, hunters and shepherds. Heren (ii. 594) does not hesitate to ascribe the formation of Egyptian caste to the meeting of different races. According to the chronology constructed by Bunsen the division into castes began in the period 10,000–9000, and was completed along with the introduction of animal worship and the improvement of writing under the third dynasty in the 6th or 7th century of the Old Empire. The Scholiast of Apollonius Rhodius, on the authority of Dicaearchus, in the _Book of Helias_ mentions a king, Sesonchosis, who, about 3717 B.C., "enacted that no one should abandon his father's trade, for this he considered as leading to avarice." Bunsen conjectures that this may refer to Sesostris, the lawgiver of Manetho's third or Memphite dynasty, the eighth from Menes, who introduced writing, building stone, and medicine; possibly, also, to Sesostris, who, Aristotle says (_Polit._ vii. 1), introduced caste to Crete. He further observes that in Egypt there was never a conquered indigenous race. There was one nation with one language and one religion; the public panegyrics embraced the whole people; every Egyptian was the child and friend of the gods. The kings were generally warriors, and latterly adopted into the sacerdotal caste. Intermarriage was the rule, except between the swineherds and all other classes. "Every shepherd is an abomination unto the Egyptians" (_Gen._ xlviii. 34).

The comprehensive essay by Sir H. H. &. Rlsey in the introductory volume of the Indian Census Report for 1901 is the best recent account of caste in India. See also, besides the works mentioned in the text, Sir Denizel Llbbetson's _Report on the Punjabi Caste_ (1881); W. Crooke, _Things Indian_ (1905) and other books by this author on Indian religion and caste; Senart, _Les Castes dans l'Inde_ (1896); Jogendra Nath Bhattacharya, _Hindu Castes and Sects_ (1896). There is an admirable essay on the subject by W. Compatible _Vorste von Indien_ (1896). See also _India, Indian Law, and Hinduism._

CASTEL, LOUIS BERTRAND (1688–1757), French mathematician, was born at Montpellier on the 11th of November 1688, and entered the order of the Jesuits in 1703. Having studied literature, he afterwards devoted himself entirely to mathematics and natural philosophy. He wrote several scientific works, that which attracted most attention at the time being his _Opuscle de couleurs_ (1740), or treatise on the melody of colours. He endeavoured to illustrate the subject by a claviceum oculare, or ocular harpsichord; but the treatise and the illustrations were quickly forgotten. He also wrote _Mathematique universelle_ (1728) and _Traité de physique sur la pesanteur universelle des corps_ (1724). He also published a critical account of the system of Sir Isaac Newton in French in 1743.

CASTELAR Y RIPOLL, EMILIO (1832–1899), Spanish statesman, was born at Cadiz on the 8th of September 1832. At the age of seven he lost his father, who had taken an active part in the progressist agitations during the reign of Ferdinand VII, and had passed several years as an exile in England. He attended a grammar-school at Sax. In 1848 he began to study law in Madrid, but soon elected to compete for admission at the school of philosophy and letters, where he took the degree of doctor in 1854. He was an obscure republican student when the Spanish revolutionary movement of 1844 took place, and the young liberals and democrats of that epoch decided to hold a meeting in the largest theatre of the capital. On that occasion Castelar delivered his maiden speech, which at once placed him in the van of the advanced politicians of the reign of Queen Isabella. From that moment he took an active part in politics, radical journalism, literary and historical pursuits. Castelar was compromised in the first rising of June 1866, which was concerted by Marshal Prim, and crushed, after much bloodshed, in the streets by Marshals O'Donnell and Serrano. A court-martial condemned him _in contumacia_ to death by "garrote vial," and he had to hide in the house of a friend until he escaped to France. There he lived two years until the successful revolution of 1868 allowed him to return and enter the Cortes for the first time as deputy for Saragossa. At the same time he resumed the professorship of history at the Madrid university. Castelar soon became famous by his rhetorical speeches in the Constituent Cortes of 1869, where he led the republican minority in advocating a federal republic as the logical outcome of the recent revolution. He thus gave much trouble to men like Serrano, Topete and Prim, who had never harboured the idea of drifting into advanced democracy, and who had each his own scheme for re-establishing the monarchy with certain constitutional restrictions. Hence arose Castelar's constant and vigorous criticisms of the successive plans mooted to place a Hohenzollern, a Portuguese, the duke of Montpesier, Espartero and finally Amadeus of Savoy on the throne. He attacked with relentless vigour the short-lived monarchy of Amadeus, and contributed to its downfall.

The abdication of Amadeus led to the proclamation of the federal republic. The senate and congress, very largely composed of monarchists, permitted themselves to be dragged along into the new time by the republican minority headed by Salmeron, Figueras, Pi y Margall and Castelar. The short-lived federal republic from the 11th of February 1873 to the 3rd of January 1874 was the culminating point of the career of Castelar, and his conduct during those eleven months was much praised by the wiser portion of his fellow-countrymen, though it alienated from him the sympathies of the majority of his quondam friends in the republican ranks.

Before the revolution of 1868, Castelar had begun to dissent from the doctrines of the more advanced republicans, and particularly as to the means to be employed for their success. He abhorred bloodshed, he disliked mob rule, he did not approve of military pronunciamientos. His idea would have been a parliamentary republic on the American lines, with some traits of the Swiss constitution to keep in touch with the regional and provincialist inclinations of many parts of the peninsula. He would have placed at the head of his Commonwealth a junta of Cortes and a national assembly of the people, ruling the country in a liberal spirit and with due regard for conservative principles, religious traditions and national unity. Such a statesman was sure to clash with the doctrinaires, like Salmeron, who wanted to imitate French methods; with Pi y Margall, who wanted a federal republic after purely Spanish ideas of decentralization; and above all with the intransigent and gloomy fanatics who became the leaders of the cantonal insurrections at Cadiz, Seville, Valencia, Malaga and Cartagena in 1873.

At first Castelar did his best to work with the other republican members of the first government of the federal republic. He accepted the post of minister for foreign affairs. He even went so far as to side with his colleagues, when serious difficulties arose between the new government and the president of the Cortes, Señor Martos, who was backed by a very imposing commission composed of the most influential conservative members of the last parliament of the Savoyard king, which had
suspended its sittings shortly after proclaiming the federal republic. A sharp struggle was carried on for weeks between the executive and this commission, at first presided over by Martos, and, when he resigned, by Salmeron. In the background Marshal Serrano and many politicians and military men steadily advocated a coup d'état in order to avert the triumph of the republicans. The adversaries of the executive were prompted by the captain-general of Madrid, Pavia, who promised the co-operation of the garrison of the capital. The president, Salmeron, and Marshal Serrano himself lacked decision at the last moment, and lost time and many opportunities by which the republican ministers profited. The federal republicans became masters of the situation in the last fortnight of April 1873, and turned the tables on their adversaries by making a pacific bloodless pronunciamiento.

The battalions of the militia that had assembled in the bullring near Marshal Serrano's house to assist the anti-democratic movement were disarmed, and their leaders, the politicians and generals, were allowed to escape to France or Portugal. The Cortes were dissolved, and the federal and constituent Cortes of the republic convened, but they only sat during the summer of 1873, long enough to show their absolute incapacity, and to convince the executive that the safest policy was to suspend the session for several months.

This was the darkest period of the annals of the Spanish revolution of 1873-1874. Matters got to such a climax of disorder, disturbance and confusion, from the highest to the lowest strata of Spanish society, that the president of the executive, Figueras, deserted his post and fled the country. Pi y Margall and Salmeron, in successive attempts to govern, found no support in the really important and influential elements of Spanish society. Salmeron had even the audacity to appeal to such well-known reactionary generals as Pavia, Sanchez, Bregua and Moriones, to assume the command of the armies in the south and in the north of Spain. Fortunately these officers responded to the call of the executive. In less than five weeks a few thousand men properly handled sufficed to quell the cantonal risings in Cordoba, Sevilla, Cadiz and Malaga, and the whole of the south might have been soon pacified, if the federal republican ministers had not once more given way to the pressure of the majority of the Cortes, composed of "Intransigentes" and radical republicans. The president, Salmeron, after showing much indecision, resigned, but not until he had recalled the general in command in Andalusia, Pavia. This resignation was not an unfortunate event for the country, as the federal Cortes not only made Castelar chief of the executive, though his partisans were in a minority in the Parliament, but they gave him much liberty to act, as they decided to suspend the sittings of the house until 2nd January 1874. This was the turning-point of the Spanish revolution, as from that day the tide set in towards the successive developments that led to the restoration of the Bourbons.

On becoming the ruler of Spain at the beginning of September 1873, Castelar at once devoted his attention to the reorganization of the army, whose numbers had dwindled down to about 70,000 men, though aided by considerable bodies of local militia and volunteers in the northern and western provinces, was insufficient to cope with the 60,000 Carlists in arms, and with the still formidable nucleus of cantonalists around Alcoy and Cartagena. To supply the deficiencies Castelar called out more than 100,000 conscripts, who joined the colours less than six weeks. He selected his generals without respect of politics, sending Moriones to the Basque provinces and Navarre at the head of 20,000 men, Martinez Campos to Catalonia with several thousand, and Lopez Domínguez, the nephew of Marshal Serrano, to begin the land blockade of the last stronghold of the cantonal insurgents, Cartagena, where the crews of Spain's only fleet had joined the revolt.

Castelar next turned his attention to the Church. He renewed direct relations with the Vatican, and at last induced Pope Pius IX. to approve his selection of two dignitaries to occupy vacant sees as well as his nominee for the vacant archbishopric of Valencia, a prelate who afterwards became archbishop of Toledo, and remained to the end a close friend of Castelar. He put a stop to all persecutions of the Church and religious orders, and enforced respect of Church property. He attempted to restore some order in the treasury and administration of finance, with a view to obtain ways and means to cover the expense of the three civil wars, Carlist, cantonal and Cuban. The Cuban insurgents gave him much trouble and anxiety, the famous Virginius incident nearly leading to a rupture between Spain and the United States. Castelar sent out to Cuba all the reinforcements he could spare, and a new governor-general, Jovellar, whom he peremptorily instructed to crush the mutinous spirit of the Cuban militia, and not allow them to drag Spain into a conflict with the United States. Acting upon the instructions of Castelar, Jovellar gave up the filibuster vessels, and those of the crew and passengers who had not been summarily shot by General Barriére. Castelar always prided himself on having terminated this incident without too much damage to the prestige of Spain.

At the end of 1873 Castelar had reason to be satisfied with the results of his efforts, with the military operations in the peninsula, with the assistance he was getting from the middle classes and even from many of the political elements in the Spanish revolution that were not republican. On the other hand, on the eve of the meeting of the federal Cortes, he could indulge in no illusions as to what he had to expect from the bulk of the republicans, who openly disserted from his conservative and conciliatory policy, and announced that they would reverse it on the very day the Cortes met. Warnings came in plenty, and no less a personage than the man he had made captain-general of Madrid, General Pavia, suggested that, if a conflict arose between Castelar and the majority of the Cortes, not only the garrison of Madrid and its chief, but all the armies in the field and their generals, were disposed to stand by the president. Castelar knew too well what such offers meant in the classic land of pronunciamientos, and he refused so flatly that Pavia did not renew his advice. The sequel is soon told. The Cortes met on the 2nd of January 1874. The intransigent majority refused to listen to a last eloquent appeal that Castelar made to their patriotism and common sense, and they passed a vote of censure. Castelar resigned. The Cortes went on wrangling for a day and night until, at daybreak on the 3rd of January 1874, General Pavia forcibly ejected the deputies, closed and dissolved the Cortes, and called up Marshal Serrano to form a provisional government.

Castelar kept apart from active politics during the twelve months that Serrano acted as president of the republic. Another pronunciamiento finally put an end to it in the last week of December 1874, when Generals Campos at Sagunto, Jovellar at Valencia, Primo de Rivera at Madrid, and Laserna at Logroño, proclaimed Alphonso XII. king of Spain. Castelar then went into voluntary exile for fifteen months, at the end of which he was elected deputy for Barcelona. He sat in all subsequent parliaments, and just a month before his death he was elected as representative of Murcia. During that period he became even more estranged from the majority of the republicans. His experience had shown him that their federal doctrines and revolutionary methods could lead only to discord, and he agreed with the aspirations of the majority of Spaniards. He desired, to use his own words, to defend and to seek the realization of the substance of the programme of the Spanish revolution of 1868 by evolution, and legal, pacific means. Hence the contrast between his attitude from 1876 to 1886, during the reign of Alphonso XII., and what he stood for in the time of the Opposition, to defend the reforms of that revolution against Señor Canovas, and his attitude from 1886 to 1891. In this latter period Castelar acted as a sort of independent auxiliary of Sagasta and of the Liberal party. As soon as Castelar saw universal suffrage re-established he solemnly declared in the Cortes that his task was accomplished, his political mission at an end, and that he proposed to devote the remainder of his life to those literary, historical, philosophical, and economic studies which he had never neglected even in the busiest days of his political career. Indeed, it was his extraordinary activity and power of
assimilation in such directions that allowed him to keep his fellow-countrymen so well informed of what was going on in "the new world." His literary and journalistic labours occupied much of his time, and were his chief means of subsistence. He left unfinished a history of Europe in the 17th century. The most conspicuous of his earlier works were:—A History of Civilization in the First Five Centuries of Christianity, Recollections of Italy, Life of Lord Byron, The History of the Republican Movement in Europe, The Redemption of Slaves, The Religious Revolution, Historical Essays on the Middle Ages, The Eastern Question, Fra Filippo Lippi, History of the Discovery of America, and some historical novels. Castelar died near Murcia on the 25th of May 1890, at the age of 66. His funeral at Madrid was an imposing demonstration of the sympathy and respect of all classes and parties. (A. E. H.)

CASTELFRANCO NELL' EMILIA, a town of Emilia, Italy, in the province of Bologna, 16 m. N.W. by rail from the town of Bologna. Pop. (1901) 3163 (town), 13,484 (commune). The churches contain some pictures by later Bolognese artists. Just outside the town is a massive fort erected by Urban VIII. in 1628, on the frontier of the province of Bologna, now used as a prison. Castelfranco either occupies or lies near the site of the ancient temple of Minerva, a place on the Via Emilia between Mutina and Bononia, where in 43 B.C. Octavian and Hirtius defeated Mark Antony.

CASTELFRANCO VENETO, a town and episcopal see of Venetia, Italy, in the province of Treviso, 16 m. W. by rail from the town of Treviso. Pop. (1901) 5220 (town), 12,523 (commune). The older part of the town is square, surrounded by medieval walls and towers constructed by the people of Treviso in 1218 (see CITTADELLA). It was the birthplace of the painter Giorgio Barbarelli (Il Giorgione, 1477-1512), and the cathedral contains one of his finest works, the Madonna with SS. Francis and Liberale (1504), in the background of which the towers of the old town may be seen.

CASTELL, EDMUND (1666-1685), English orientalist, was born in 1666 at Tadlow, in Cambridgeshire. At the age of fifteen he entered Emmanuel College, Cambridge, but afterwards changed his residence to St John's, on account of the valuable library there. His great work was the compiling of his Lexicon Heptaglotton Hebraicum, Chaldaicum, Syriacum, Sogdianum, Aethiopicum, Arabum, Persicum (1680). Over this book, he worked for eighteen years, working (if we may accept his own statement) from sixteen to eighteen hours a day; he employed fourteen assistants, and by an expenditure of £12,000 brought himself to poverty, for his lexicon, though full of the most unusual learning, did not find purchasers. He was actually in prison in 1667 because he was unable to discharge his brother's debts, for which he had made himself liable. A volume of poems dedicated to the king brought him preferment. He was made prebendary of Canterbury and professor of Arabic at Cambridge. Before undertaking the Lexicon Heptaglotton, Castell had helped Dr Brian Walton in the preparation of his Polyglott Bible. His MSS. he bequeathed to the university of Cambridge. He died in 1685 at Higham Gobion, Bedforshire, where he was rector. The Syriac section of the Lexicon was issued separately at Gottingen in 1794 by J. D. Michaelis, who offers a tribute to Castell's learning and industry. Trier published the Hebrew section in 1790-1792.

CASTELLAMARE DI STABIA (anc. Stabiae), a seaport and episcopal see of Campania, Italy, in the province of Naples, 17 m. S.E. by rail from the town of Naples. Pop. (1901) town, 26,378; commune, 32,886. It lies in the south-east angle of the Bay of Naples, at the beginning of the peninsula of Sorrento, and owing to the sea and mineral water baths (12 different springs) and its attractive situation, with a splendid view of Vesuvius and fine woods on the hills behind, it is a favourite resort of foreigners in spring and autumn and of Neapolitans in summer. The castle from which it takes its name, on the hill to the south of the town, was built by the emperor Frederick II. There are three large churches of the late 18th century. There are a large royal dockyard and a small-arms factory; there are also iron works, cotton, flour and macaroni mills. The value of imports (chiefly coal, wheat, scrap-iron and cheese) for 1904 was £1,226,48, and the value of exports (chiefly macaroni and grapefruit) £760,100. There is also sponge trade, but the former coral trade is depressed. The port was cleared by 420 vessels of 477,713 tonnage in 1905. An electric tramway along the coast road to Sorrento was opened in 1905.

CASTELLIES, ADRIANO (c. 1460?-c. 1521?), known also as CORNETO from his birthplace, Italian cardinal and writer, was sent by Innocent VIII. to reconcile James III. of Scotland with his subjects. While in England he was appointed (1503), by Henry VII., to the see of Hereford, and in the following year to the more lucrative diocese of Bath and Wells, but he never resided in either. Returning to Rome, he became secretary to Alexander VI. and was made by him cardinal (May 31, 1503). A man of doubtful reputation, Alexander's confidant and favourite, he paid the pope a large sum for his elevation. He bought a villa in the Borgo near the Vatican, and thereon erected a sumptuous palace after designs by Bramante; and it was here, in the summer of 1503, that he entertained the pope and Cesare Borgia at a banquet that went on till nightfall despite the unhealthy season of the year, when ague in its most malignant form was raging. Of the three, Cardinal Adrian was the first to fall ill, the pope succumbing a week after. The: thought of the poisoning of the pope is to be relegated to the realm of fiction. Soon after the election of Leo X., the cardinal was implicated in the conspiracy of Cardinal Petracci against the pope, and confessed his guilt; but, pardoned being offered only on condition of the payment of 25,000 ducats, he fled from Rome and was subsequently deposed from the cardinalate. As early as 1504 he had presented his palace (now the Palazzo Giraud-Torlonia) to Henry VII. as a residence for the English ambassador to the Holy See; and on his flight Henry VIII., who had quarrelled with him, gave it to Cardinal Campeggio. Adrian first fled to Venice. Of his subsequent history nothing is known for certain. It is said that he was murdered by a servant when on his way to the conclave that elected Adrian VI. As a writer, he was one of the first to restore the Latin tongue to its pristine purity; and among his works are De Vera Philosophia ex quatuor doctoribus ecclesiae (Bologna, 1527); De Sermone Latino (Basel, 1513), and a poem, De Venatione (Venice, 1534).

CASTELLI, IGNAZ FRANZ (1781-1862), Austrian dramatist, was born at Vienna on the 6th of March 1781. He studied law at the university, and then entered the government service. During the Napoleonic invasions his patriotism inspired him to write stirring war songs, one of which, Kriegslaend fur die ost- und westlichen Armee, was printed by order of the archduke Charles and distributed in thousands. For this Castelli was proclaimed by Napoleon in the Moniteur, and had to seek refuge in Hungary. In 1815 he accompanied the allies into France as secretary to Count Czarniak, and, after his return to Vienna, resumed his official post in connexion with the estates of Lower Austria. In 1842 he retired to his property at Lillienfeld, where, surrounded by his notable collections of pictures and other art treasures, he for the rest of his life devoted himself to literature. Castelli's dramatic talent was characteristically Austrian; his plays were well constructed and effective and satirized unsparingly the foibles of the Viennese. But his wit was too local and ephemeral to appeal to any but his own generation, and if he is remembered at all to-day it is by his excellent Gedichte in niederosterreichischer Mundart (1828). He died at Lillienfeld on the 3rd of February 1862.

Castelli's Gesammelte Gedichte appeared in 1838 in 6 vols.; a selection of his works in 3 vols. (2nd ed., 1848); followed by 6 supplementary volumes in 1858. His autobiography, Memoiren meiner Lebens, appeared in 1861-1862 in 4 vols.

CASTELLO, BERNARDO (1557-1629), Genoese portrait and historical painter, born at Albaro near Genoa, was the intimate friend of Tasso, and took upon himself the task of designing the figures of the Gerusalemme Liberata, published in 1592;
some of these subjects were engraved by Agostino Caracci. Besides painting a number of works in Genoa, mostly in a rapid and superficial style, Castello was employed in Rome and in the court of the duke of Savoy.

CASTELLO, GIOVANNI BATTISTA (1596?–1659?), Italian historical painter, was born near Bergamo in 1596 or perhaps 1599, and is henceordinarily termed Il Bergamasco. He belongs, however, to the school of Genoa, but does not appear to have had any family relationship with the other two painters named Castello, also noticed here. He was employed to decorate the Nunziata di Portoria in Genoa, the saloon of the Lanzi Palace at Pisa, and the Pardo Palace in Spain. His best-known works are the “Martrydom of St. Sebastian,” and the picture of “Christ as Judge of the World” on one of the vaultings of the Annunziata. He was an architect and sculptor as well as a painter. In 1657 he was invited to Madrid by Philip II., and there he died, holding the office of architect of the royal palaces. The date of death (as of birth) is differently stated as 1596 or 1579.

CASTELLO, VALERIO (1625–1659), Italian painter, was the youngest son of Bernardo Castello (q.v.). He surpassed his father, and particularly excelled in painting battle-scenes. He painted the “Rape of the Sabines,” now in the Palazzo Brignole, Genoa, and decorated the cupola of the church of the Annunziata in the same city. In these works he is regarded by his admirers as combining the fire of Tintoretto with the general style of Paolo Veronese.

CASTELLO BRANCO, CAMILLO, VISCONDE DE COREIA Botelho (1825–1890), Portuguese novelist, was born out of wedlock and lost his parents in infancy. He spent his early years in a village in Traz-os-Montes. He learned to love poetry from Camoens and Bocage, while Mendes Pinto gave him a lust for adventure, but he dreamed more than he read, and grew up undisciplined and proud. He studied in Oporto and Coimbra with much irregularity, and since his disdain for the intrigues and miseries of politics in Portugal debarred him from the chance of a government post, he entered the career of letters to gain a livelihood. After a spell of journalistic work in Oporto and Lisbon, he proceeded to the Episcopal seminary in Braga, but took leave of absence in order to write. He was the first to make Braga, As Modernas Ideias na literatura Portuguesa (Oporto, 1882); Padre Senna Freitas, Perfil de Camillo Castello Branco (S. Paulo, 1887); and Paulo Osório, Camillo, a sua vida, o seu genio, a sua obra (Oporto, 1908).

CASTELLO BRANCO, an episcopal city and the capital of an administrative district formerly included in the province of Beira, Portugal; 1,356 ft. above the sea, on the Abrantes-Guarda railway. Pop. (1900) 7,288. Numerous Roman remains bear witness to the antiquity of Castello Branco, but its original name is unknown. The city is dominated by a ruined castle, and partly enclosed by ancient walls; its chief buildings are the cathedral and episcopal palace. Cloth is manufactured, and there is a flourishing local trade in cork, wine and olive oil. The administrative district of Castello Branco, which comprises the valleys of the Zêzere, Ourem and Ponsul, right-hand tributaries of the Tagus, coincides with the south-eastern part of Beira; pop. (1900) 216,688; area, 2,782 sq. m.

CASTELLÓN DE LA PLANA, a maritime province of eastern Spain, formed in 1833 of districts formerly included in Valencia, and bounded on the N. by Teruel and Tarragona, E. by the Mediterranean Sea, S. by Valencia, and W. by Teruel. Pop. (1900) 310,828; area, 2495 sq. m. The province of the surface is almost everywhere mountainous, and flat only near the coast and along some of the river valleys. Even on the coast the Atalayas de Alcalá and the Desierto de las Palmas form two well-defined though not lofty ridges. The Mijares or Millares is the principal river, flowing east-south-east from the highlands of Teruel, between the Sierras of Espina and Espadan towards the south, and the peak called Peña Golosa (5935 ft.) towards the north, until it reaches the sea a little south of the capital, also called Castellón de la Plana. The Monleó, a left-hand tributary of the Mijares; the Bergantes, which flows inland to Montesinos; and the Turón, which flows from Tarragona; and a variety of lesser streams, render the province abundantly fertile. No considerable inlet breaks the regularity of the coast-line, and there is no first-class harbour. The climate is cold and variable in the hilly districts, temperate in winter and very warm in summer in the lowlands. Agriculture, fruit-growing, and especially the cultivation of the vine and olive, employ the majority of the peasantry; stock-farming and sea-fishing are also of importance. Lead, zinc, iron and other ores have been discovered in the province; but in 1903, out of 120 mining concessions registered, only two were worked, and their output, lead and zinc, was quite insignificant. The local industries are mainly connected with fish-curing, paper, porcelain, woolens, cotton, silk, esparto, bandy and oils. Wine, oranges and oil are exported to foreign countries and...
other parts of Spain. The important Barcelona-Valencia railway skirts the coast, passing through the capital; and the Catanayud-Sagunto line crosses the southern extremity of the province. Elsewhere the roads, which are generally indifferent, form the sole means of communication. Castellón (29,904), Villarreal (16,068), the port of Burriana (12,062), and Peñíscola (3,142), a town of some historical interest, are described in separate articles. The other chief towns are Alcalá de Chivert (6,293), Almazora (7,076), Benicarló (7521), Maella (7355), Onda (6592), Segorbe (745), Vall de Uxó (8643), Villamamés (6708) and Vinaroz (8625).

CASTELLÓN DE LA PLANA, the capital of the province described above, on the Barcelona-Valencia railway, 4 m. from the Mediterranean Sea. Pop. (1900) 29,094. The broad and fertile plain in which Castellón is built is watered artificially by a Moorish aqueduct, largely cut through the solid rock, and supplied by the estuary of the Mijares, 5 m. south-east. The town is partly encircled by ancient walls; and, although most of its public buildings are modern, it contains several convents of early foundation, a curious old belfry, 150 ft. high, and a parish church chiefly noteworthy for a painting in the interior by Francisco Ribalta, who was born here in the middle of the 17th century. Castellón has a brisk trade, its manufactures comprising porcelain, leather, silk, linen, brandy and cork goods. Its harbour, El Grío de Castellón, about 4 m. east, is annually entered by some 200 small vessels. A light railway, which traverses the numerous and profitable orange plantations on the south-west, connects it with the towns of Almazora, Villarreal, Burriana and Onda. Under its Moorish rulers Castellón occupied a hill to the north of its present site; its removal to the plain by James I of Aragon (1213-1276) gave the town its full name,"Castellón of the Plain."

CASTELNAU, MICHEL DE, SIEUR DE LA MAUVISSIÈRE (c. 1520-1592). French soldier and diplomatist, ambassador to Queen Elizabeth, was born in Toulouse about 1520. He was one of a large family of children, and his grandfather, Pierre de Castelnaux, was equerry to Louis XII. Endowed with a clear and penetrating intellect and remarkable strength of memory, he received a careful education, to complete which he travelled in Italy and made a long stay at Rome. He then spent some time in Malta, afterwards entered the army, and made his first acquaintance with war in the campaigns of the French in Italy. His abilities and his courage won for him the friendship and protection of the cardinal of Lorraine, who took him into his service. In 1557 a command in the navy was given to him, and the cardinal proposed to get him knighted. This, however, he declined, and then joined the French army in Picardy. Various delicate missions requiring tact and discretion were entrusted to him by the constable de Montmorency, and these he discharged so satisfactorily that he was sent by the king, Henry II., to Scotland with despatches for Mary Stuart, then betrothed to the dauphin (afterwards Francis II.). From Scotland he passed into England, and treated with Queen Elizabeth respecting her claims on Calais (1559), a settlement of which was effected at the congress of Cateau-Cambrésis. He was next sent as ambassador to the princes of Germany, for the purpose of prevailing upon them to withdraw their favour from the Protestants. This embassy was followed by missions to Margaret of Parma, governess of the Netherlands, to Savoy, and then to Rome, to ascertain the views of Pope Paul IV. with regard to France. Paul having died just before his arrival, Castelnaux used his influence in favour of the election of Pius IV. Returning to France, he once more entered the navy, and served under his former patron. It was his good fortune, at Nantes, to discover the earliest symptoms of the conspiracy of Amboso, which he immediately reported to the government.

After the death of Francis II. (December 1560) he accompanied the queen, Mary Stuart, to Scotland, and remained with her a year, during which time he made several journeys into England, and attempted to bring about a reconciliation between Mary and Queen Elizabeth. The wise and moderate counsels which he offered to the former were unheeded. In 1562, in consequence of the civil war in France, he returned there. He was employed against the Protestants in Brittany, was taken prisoner in an engagement with them and sent to Havre, but was soon after exchanged. In the midst of the excited passions of his countrymen, Castelnaux, who was a sincere Catholic, maintained a wise self-control and moderation, and by his counsels rendered valuable service to the government. He served at the siege of Rouen, distinguished himself at the battle of Dreux, took Tancarville, and contributed in 1563 to the recapture of Havre from the English.

During the next ten years Castelnaux was employed in various important missions—first to Queen Elizabeth, to negotiate a peace; next to the duke of Alba, the new governor of the Netherlands. On this occasion he discovered the project formed by the prince of Condé and Admiral Coligny to seize and carry off the royal family at Montceaux (1567). After the battle of St Denis he was again sent to Germany to solicit aid against the Protestants; and on his return he was rewarded for his services with the post of governor of Saint-Dizier, and a company of orderlies. At the head of his company he took part in the battles of Jarnac and Moncontour. In 1572 he was sent to England by Charles IX. to allay the excitement created by the massacre of St Bartholomew, and the same year he was sent to Germany and Switzerland. Two years later he was reappointed by Henry III. ambassador to Queen Elizabeth, and he remained at her court for ten years. During this period he used his influence to promote the marriage of the queen with the duke of Alençon, with a view especially to strengthen and maintain the alliance of the two countries. But Elizabeth made so many promises only to break them that at last he refused to accept them or communicate them to his government. On his return to France he found that his château of La Mauvissière had been destroyed in the civil war; and as he refused to recognize the authority of the League, the duke of Guise deprived him of the governorship of Saint-Dizier. He was thus brought almost to a state of destitution. But on the accession of Henry IV., the king, who knew his worth, and was confident that although he was a Catholic he might rely on his fidelity, gave him a command in the army, and entrusted him with various confidential missions.

Castelnaux died at Joinville in 1592. His Mémoires rank very high among the original authorities for the period they cover, the eleven years between 1559 and 1570. They were written during his last embassy in England for the benefit of his son; and they possess the merits of clearness, veracity and impartiality. They were first printed in 1621; again, with additions by Le Labourer, in 2 vols. folio, in 1659; and a third time, still further enlarged by Jean Godfrey, 3 vols. folio, in 1731. Castelnaux translated into French the Latin work of Rams, On the Manners and Customs of the Ancient Gauls. Various letters of his are preserved in the Cottonian and Harleian collections in the British Museum.

His grandson, JACQUES DE CASTELNAU (1620-1658), distinguished himself in the war against Austria and Spain during the ministries of Richelieu and Mazarin, and died marshal of France.

See Dubaut, Ambassade de Castelnaux en Angleterre (1856); Relations politiques de la France ... avec l’Ecosse au seizième siècle, edited by J. B. A. T. Teulet (1862); and De la Ferrière, Les Projets de mariage d’Elisabeth (1883).

CASTELNAUDARY, a town of south-western France, capital of an arrondissement in the department of Aude, 22 m. W.N.W. of Carcassonne, on the Southern railway between that city and Toulouse. Pop. (1906) 6650. It is a little situated on an elevation in the midst of a fertile and well-cultivated plain; and its commercial facilities are greatly increased by the Canal de MIDI, which widens out, as it passes the town, into an extensive basin surrounded with wharves and warehouses for the timber used in the upkeep of the canal. The principal buildings are the law court, the hôtel de ville, and the church of St Michel, dating from the 14th century; none of these offers any feature of unusual interest. There are a number of flour-mills, as well as manufactories of earthenware, tiles and blankets; an extensive
trade is maintained in lime, gypsum, timber, grain, fruits, wine, wool, cattle and farm implements, and the building of canal boats forms an important industry. The public institutions include the sub-prefecture, tribunals of first instance and of commerce, a communal college and a hospital.

Castelnauaudry probably ancient town of Stomagus, taken during the 7th century by the Visigoths, who, it is conjectured, rebuilt the town, calling it Castrum Novum Ariarorum, whence the present name. Early in the 13th century the town was the scene of several struggles during the war against the Albigenses, between Simon IV., count of Montfort, and Raymond VI., count of Toulouse, and their supporters. In 1229 it was deprived of its ramparts, and after these had been rebuilt, it was captured and burned by the Black Prince in 1355, but again rebuilt in 1366. In 1632 it was the scene of a cavalry engagement in which the rebel Henry II., duke of Montmorency, was defeated and captured by the royal troops.

CASTELSARRASIN, a town of south-western France, capital of an arrondissement in the department of Tarn-et-Garonne, 12 m. W. of Montauban on the Southern railway. Pop. (1906) town, 3189; commune, 7496. Castelsarrasin, situated on the left bank of the lateral canal of the Garonne and about a mile from the right bank of that river, is surrounded by promenades occupying the site of the old fortifications. Its chief building is the brick-built church of St Sauveur, which dates from the 13th century. Its administrative buildings are modern. The town has a sub-prefecture, a tribunal of first instance, and a communal college. The principal industrial establishment is the metal-foundry of Sainte-Marguerite, where copper, tin and other metals are worked; there are also flour-mills, saw-mills and dye-works. Trade is in cattle, agricultural produce, wine, baskets and game.

The name Castelsarrasin appears in the 13th century, when the village of Villelongue was replaced by the present bastide. Castrum Cercuicum, Castel-sur-Azine (from the neighbouring stream, Azine) and Castellum Sarracenum are suggested derivations, none of which can be adopted with certainty.

CASTI, GIOVANNI BATTISTA (1721-1803). Italian poet, was born of humble parents at Montelibretto, in the states of the church, in 1721. He rose to the dignity of canon in the cathedral of his native place, but gave up his chance of church preferment to satisfy his gay and restless spirit by visiting most of the capitals of Europe. In 1762, on the death of Metastasio, he was appointed Poeta Cæsario, or poet-laureate of Austria, in which capacity he applied himself with great success to the opera bouffe; but in 1769, the enthusiasm of his administrative buildings were modern. To 1803. Casti is best known as the author of the Novelle galant, and of Gl’Animali parlanti, a poetical allegory, over which he spent eight years (1794-1802), and which, notwithstanding its tedious length, excited so much interest that it was translated into French, German and Spanish, and (very freely and with additions) into English, in W. S. Rose’s Court and Parliament of Beasts (Lond., 1819). Written during the time of the Revolution in France, it was intended to exhibit the feelings and hopes of the people and the defects and absurdities of various political systems. The Novelle Galant is a series of poetical tales, in the ottava rima—a metre largely used by Italian poets for that class of compositions. The sole merit of these poems consists in the harmony and purity of the style, and the liveliness and sarcastic power of many passages. They are, however, characterized by the grossness licentiousness; and there is no originality of plot—that, according to the custom of Italian novelists, being taken from classical mythology and other ancient legends. Among the other works of Casti is the Poesie Tartare, a more heroic satire on the court of Catherine II., with which he was personally acquainted.

CASTIGLIONE, BALDASSARE (1478-1559). Italian diplomat and man of letters, was born at Casanatino near Mantua, and was educated at Milan under the famous professors Merula and Chalcondyles. In 1496 he entered the service of Lodovico Sforza, duke of Milan, returning to Mantua in 1500 when Lodovico was carried prisoner into France. In 1504 he was attached to the court of Guidobaldo Malatesta, duke of Urbino, and in 1506 he was sent by that prince on a mission to Henry VII. of England, who had before conferred on Federigo Malatesta, "the Good Duke," the most famous mercenary of his age, the order of the Garter. Guidobaldo dying childless in 1508, the ducy of Urbino was given to Francesco Maria della Rovere, for whom Castiglione, envoy at the court of Leon X. (Medici), obtained the office of generalissimo of the Papal troops. Charged with the arrangement of the dispute between Clement VII. (Medici) and Charles V., Castiglione crossed, in 1524, into Spain, where he was received with highest honours, being afterwards naturalized, and made bishop of Avila. In 1527, however, Rome was seized and sacked by the Imperialists under Bourbon, and in July of the same year the surrender of the castle of Sant' Angelo placed Clement in their hands. Castiglione had been tricked by the emperor, but there were not wanting accusations of treachery against himself. He had, however, placed fidelity highest among the virtues of his ideal "courtier," and when he died at Toledo in 1529 it was said that he had died of grief and shame at the imagination. The emperor mourned him as "one of the world's best cavaliers." A portrait of him, now at the Louvre, was painted by Raphael, who disdained neither his opinion nor his advice.

Castiglione wrote little, but that little is of rare merit. His verses, in Latin and Italian, are elegant in the extreme; his letters (Padua, 1769-1771) are full of grace and finesse. But the book by which he is best remembered is the famous treatise, II Cortegiano, written in 1513, published at Venice by Aldus in 1528, and translated into English by Thomas Hoby as early as 1561. This book, called by the Italians Il Libro d'oro, and remarkable for its easy force and underestimating elegance of style no less than for the nobility and manliness of its theories (see the edition by V. Cian, Florence, 1894), describes the Italian gentleman of the Renaissance under his brightest and fairest aspect, and gives a charming picture of the court of Guidobaldo da Montefeltre, duke of Urbino, "confessedly the purest and most elevated court in Italy." In the form of a discussion held in the duchess's drawing-room—with Elisabetta Gonzaga, Pietro Bembo, Bernardo Bibbiena, Giuliano de' Medici, Emilia Pia, and Ceretino the Unique among the speakers—the question, What constitutes a perfect courtier? is debated. With but few differences, the type determined on is the ideal gentleman of the present day.

See P. L. Ginguené, Histoire littéraire de l'Italie, vi., viii.; J. A. Schmidt, Geschichte der Weltliteratur (Berlin, 1878), C. Hare, Courts and Camps of the Italian Renaissance (1908); Julia Cartwright, B. Castiglione, the Perfect Courtier (1908), with good bibliography.

CASTIGLIONE, CARLO OTTAVIO, COUNT (1784-1849), Italian philologist, was born at Milan of an ancient family. His principal work was done in connexion with the Arabic and other Oriental languages, but he also performed good service in several other departments. In 1819 he published Monete cufiche del Museo di Milano, and assisted Cardinal Mai in his Ulpitiae partium incitatiorum in Ambrosiis palimpsestis repertorum editio. A learned Mémoire géographique et numismatique sur la partie orientale de la Barbarie appelée Afrique par les Arabes appeared in 1826, and established his reputation. In 1829 he published by himself the Gothic version of the second epistle of Paul to the Corinthians; and this work followed by the Gothic version of the epistle to the Romans, the first cufiques and the second cufiques and the epistle to the Ephesians in 1834, by Galatians, Philippans, and 1 Thessalonians in 1835, and by 2 Thessalonians in 1839. He died at Genoa on the 10th of April 1849.

His Life, by Biondelli, appeared at Milan in 1856.

CASTIGLIONE, GIOVANNI BENEDETTO (1616-1679), called in Italy II Grechetto, and in France Le Benédette, Italian painter of the Genoese school, was born in Genoa, and studied for some time under Vandycck. He painted portraits, historical pieces and landscapes, but chiefly excelled in fairs, markets and rural scenes with animals. Noah and the animals entering the
Ark was a favourite subject of his. His paintings are to be found in Rome, Venice, Naples, Florence, and more especially Genoa and Mantua. He also executes a number of etchings, which are brilliant, fresh, and full of taste; "Diogenes searching for a Man" is one of the principal of these. The etchings are remarkable for light and shade, and have even earned for Castiglione the name of "a second Rembrandt." The Presepio (Nativity of Jesus) in the church of San Luca, Genoa, ranks among his most celebrated paintings, and the Louvre contains eight characteristic examples. In his closing years he lived in Mantua, painting for the court; here he received his name of "Greechetto," from the classic air of his pastorals, and here he died of gout in 1670. His brother Salvatore and his son Francesco excelled in the same subjects; and it is thought that many paintings which are ascribed to Benedetto are only copies after him, or perhaps originals by his son or brother.

**CASTIGLIONE DELLE STIVIERE,** a town of Lombardy, Italy, in the province of Mantua, 20 m. N.W. of Mantua by road. Pop. (1901) 4122 (town), 5940 (commune). It has an old castle, much altered and restored, especially by the Gonzaga family of Mantua in the 16th century. During the time of the Spanish domination the French under the duke of Vendôme occupied it; and during the siege of Mantua in 1796, the Austrians under Würmser were defeated here by the French under Augereau, who was later created by Napoleon duke of Castiglione.

**CASTIGLONE OLONA,** a town of Lombardy, Italy, in the province of Como, 27 m. N.E. of Milan by rail. Pop. (1901) 1806. The choir of the collegiate church, erected about 1428 by Cardinal Branda Castiglione, contains fine frescoes by Masolino of Florence: there are other works by the same master in the baptistery. The tomb of the cardinal (1443) is good. The church of S. Sepolcro, in the lower part of the town, has two large stone figures of saints on its façade (of the end of the 13th century) and, within, painted wooden figures and the tomb of Guido Castiglione (d. 1485) with fine sculptures of the school of Amadeo. The palace erected by Cardinal Castiglione has good terra-cotta decorations.

**CASTILLO,** an ancient kingdom of Spain, occupying the central districts of the Iberian Peninsula; and bounded on the N. by the Bay of Biscay, N.E. by the Basque Provinces and Navarre, E. by Aragon, S.E. by Valencia and Murcia, S. by Andalusia, W. by Estremadura and Leon, and N.W. by Asturias. Pop. (1900) 57,087,713; area, 55,307 sq. m. The name Castile is commonly said to be derived from the numerous frontier forts (castillos) erected in the middle ages as a defence against the Moors. The northern part of the kingdom, which was first freed from Moorish rule, is called Old Castile (Castilla la Vieja); the southern, acquired later, is called New Castile (Castilla la Nueva). These two divisions, with a third known as North Castile, now rank as military districts or captaincies-general; but the term "North Castile," which covers the northern extremity of Old Castile, is not generally used. In 1833 Old Castile was divided into the provinces of Ávila, Burgos, Logroño, Palencia, Santander, Segovia, Soria, and Valladolid; while Old Castile was similarly divided into the provinces of Guadalajara, Guadarrama, Madrid, and Toledo.

The modern progress of commerce, communications, &c., in these thirteen provinces is described in the separate articles upon each of them.

Castile extends for about 300 m. from north to south, and 160 m. from east to west. It consists of a vast central plateau, with an average altitude of about 2500 ft. This plateau has a natural frontier of high mountains on all sides, except on the borders of Leon and Murcia; it is also bisected by the Sierra de Guadarrama and Sierra de Gredos, which extend in a south-western direction across the central districts, and form the dividing line between Old and New Castile. Geographically it includes also the high plains of Leon, towards the north-west, and of Murcia on the south-east. The existing frontier is marked on the north by the Cantabrian Mountains (q.v.); on the east by the Sierra de la Demanda with its offshoots, and by the Serranía de Cuenca; on the south by the Sierra Morena; and on the west by various minor ranges which link together the three more or less parallel chains of the Sierra de Gréados, Sierra de Guadalupé and Sierra Morena. Three great rivers, the Douro, which traverses Old Castile, with the Tagus and Guadiana, which respectively drain the central and southern regions of New Castile, flow westward into Portugal, and finally reach the Atlantic; while the Ebro, which rises in the north of the kingdom, skirts the north-eastern frontier on its way to the Mediterranean. These rivers are described under their own names.

The climate of Old Castile is healthy, but liable to severe cold and heat. Snow falls early and lies late in the mountains, and there is a heavy rainfall in the north-west. New Castile has a still more rigorous climate, for although the mean annual temperature is about 50° Fahr., the summer heat in the valleys is peculiarly oppressive, and the highlands are swept by scorching or icy gales, laden with dust. The rainfall rarely exceeds 20 in. in a year.

In both the Castiles the central plateau has a naturally fertile soil, for after rain a luxuriant vegetation appears; but drought is common, owing to the insufficient volume of rainfall, and the failure of the Spaniards to extend the fine system of irrigation which the Moors originated. Certain districts, indeed, in which a layer of heavy loam underlies the porous and friable surface, are able to retain the moisture which elsewhere is absorbed. Such land is found in Palencia, and in the Mesa de Ocaña, where it yields abundant crops; and many of the northern mountains are well wooded. But vast tracts of land are useless except as pasture for sheep, and even the sheep are driven by the severe winters to migrate yearly into Estremadura (q.v.). The normal Castilian landscape is an arid and sterile steppe, with scarcely a tree or spring of water; and many even of the villages afford no relief to the eye, for they are built of sunburnt unbaked bricks, which share the dusty brownish-grey tint of the soil. Especially characteristic is the great plain of La Mancha (q.v.).

The transformation of Castile from a small country in the north of what is now Old Castile into an independent monarchy, was due to the decisive events in the reconquest of Spain from the Moors, and the successful resistance offered by Asturias to the invaders had been followed by the liberation of Galicia and Leon, when Ferdinand I. of Castile (1035-1065), by his marriage with Sancha, widow of the last king of Leon, was enabled to unite Leon and Castile in a single kingdom, with its capital at Burgos. New territories were annexed on the south, until, after the capture of Toledo in 1085, and the consequent formation of a New Castile, the kingdom comprised the whole of central Spain. Thenceforward its history is inseparable from that of the whole country; and it is therefore described in full, together with the language and literature of Castile, under Spain (q.v.).

Castilian, which is the literary language of Spain, and with certain differences, of Spanish America, is spoken in Old and New Castile, Aragon, Estremadura, and the greater part of Leon; and in Andalusia it is subject to various modifications of accent and pronunciation. As there is little, if any, difference of racial origin, character and physical type, among the inhabitants of this region, except in Andalusia, and, to a less extent, in Estremadura, the Castilian is justly regarded as the typical Spanish. Among the Castilian provinces, where education and foreign influence have never penetrated deeply, the national character can best be studied. Its intense pride, its fatalistic indolence and ignorance, its honesty and its bigotry, tempered by a keen sense of humour, are well-known characteristics. Apart from the peasant class, Castilians have contributed more to the development of Spanish art and literature than the inhabitants of any other region except, perhaps, Andalusia, which claims to be regarded as supreme in architecture and painting. Of the two great Spanish universities, Alcalá de Henares belonged in all respects to Castile, and Salamanca rose to equality with Paris, Oxford or Bologna, under the purely Castilian influence of Alfonso X. (1252-1284).

For a general description of Castile and its inhabitants, antiquities, commerce, &c., see *Castilla la Nueva*, three illustrated volumes in
the series *España*, by J. M. Quadro and V. de la Fuente (Barcelona, 1883-1890), and the *Guía del antiguo reino de Castilla*, by E. Valverde y Álvarez (Madrid, 1886), which deals with the provinces of Burgos, Santander, Logroño, Soria, Ávila and Segovia. For the history, see in addition to the works cited under Spain (section History), *Crónicas de los reyes de Castilla*, by C. Rosell (Madrid, 1875-1877, 2 vols.); *Colección de las crónicas y memorias de los reyes de Castilla* (Madrid, 1779-1787, 7 vols.); and *Historia de las comunidades de Castilla* (Madrid, 1870).

CASTILLO, ANTONIO DE FELICIANO DE (1800-1875), Portuguese man of letters, was born at Lisbon. He lost his sight at the age of six, but the devotion of his brother Augusto, aided by a retentive memory, enabled him to go through his school and university course with success; and he acquired an almost complete mastery of the Latin language and literature. His first work of importance, the *Cartas de Echo e Narciso* (1821), belongs to the pseudo-classical school in which he had been brought up, but his romantic leanings became apparent in the *Primavera* (1823) and in *Amor e Melancholia* (1823), two volumes of honeyed and prolix bucolic poetry. In the poetic legends *A noite de Castello* (1836) and *Cuímes do bardo* (1838) Castilho appeared as a full-blown Romanticist. These books exhibit the defects and qualities of all his work, in which lack of ideas and of creative imagination and an atmosphere of artificiality are ill compensated for by a certain emotional charm, great purity of diction and melodious versification. Belonging to the didactic and descriptive school, Castilho saw nature as all sweetness, pleasure and beauty, and he lived in a dreamland which he exchanged for the succession of King John VI. He brought him an office of profit at Coimbra. On his return from a stay in Madeira, he founded the *Revista Universal Lisbonense*, in imitation of Herculano's *Panorama*, and his profound knowledge of the Portuguese classics served him well in the introduction and notes to a very useful publication, the *Litteraria Classica Portuguesa* (1845-1847, 25 vols.), while two years later he established the "Society of the Friends of Letters and the Arts." A study on Camoens and treatises on metrification and mnemonics followed from his pen. His praise-worthy zeal for popular instruction led him to take up the study of pedagogy, and in 1850 he brought out his *Leitura Repertoria*, a method of reading which was named after him, and he became government commissary of the schools which were destined to put it into practice. Going to Brazil in 1854, he there wrote his famous "Letter to the Empress." Though Castilho's lack of strong individuality and his over-great respect for authority prevented him from achieving original work of real worth, his translations of Anacreon, Ovid and Virgil and the *Chave do Enigma*, explaining the romantic incidents that led to his first marriage with D. Maria de Baena, a niece of the satirical poet Tolentino, and a descendant of Antonio Ferreira, reveal him as a master of form and a purist in language. His versions of Goethe's *Faust* and Shakespeare's *Midsummer Night's Dream*, made without a knowledge of German and English, scarcely added to his reputation. When the Coimbra question arose in 1865, Garrett was dead and Herculano had ceased to write, leaving Castilho supreme, for the moment, in the realm of letters. But the youthful Anheiro de Quental withstood his claim to direct the rising generation and assisted its superannuated leadership, and after a fierce war of pamphlets Castilho was dethroned. The rise of João de Deus reduced him to a secondary position in the Portuguese Parnassus, and when he died ten years later much of his former fame had preceded him to the tomb.

See J. "Monografías de Castilho" in the Instituto de letras; Innocencio da Silva in *Dicionario bibliographico Portugues*, l. 130 and viii. 132; Latino Coelho's study in the *Revista contemporanea de Portugal e Brazil*, vols. i. and ii.; Dr Theophilo Braga, *Historia do Romantismo* (Lisbon, 1880). (E. P.)

CASTILLO, CRISTÓBAL DE (1490-1559), Spanish poet, was born at Ciudad Rodrigo in 1490. In 1518 he left Spain with Ferdinand of Austria, afterwards emperor, whose private secretary he eventually became. While residing at Vienna in 1528-1530 he wrote the *Historia de Piramo y Tisbe*, and dedicated it to Anna von Schaumburg, with whom he had a platonic love-affair. He seems to have visited Venice, to have been neglected by his patron, to have fallen ill in 1540, and to have passed his last years in poverty. He died on the 12th of June 1556, and was buried at Vienna. Castillo's poems are interesting, not merely because of their intrinsic excellence, but also because they are the most powerful protest against the metrical innovations imported from Italy by Boscán and Garciilaso de la Vega. He adheres to the native quintillas or to the *coplas de pie quebrado*, and only abandons these traditional forms when he indulges in caustic parody of the new school—as in the lines *Contra los que dejan los metrlos castellanos*. He excels by virtue of his charming simplicity and his ingenious wit, always keen, sometimes licentious, never brutal. The urbane gaiety of his occasional poems is delightfully spontaneous, and the cynical humour which informs the *Diálogo de las condiciones de las mujeres* and the *Diálogo de la vida de la corte* is impregnated with the Renaissance spirit. Castillo is the Clément Marot of Spain. His plays are lost; the best text of his verses is that printed at Madrid in 1592.

CASTILLO, ANTONIO DE (1854-1877), Spanish novelist and playwright, is stated to have been baptized at Tordesillas near Valladolid on 1st October 1854. Nothing is known of his youth, and he is next heard of at Madrid in 1869 as a man of literary tastes. While in the service of the marquis de Villar, he issued his first work, *Donaires del Parnaso* (1864-1865), two volumes of humorous poems; his Tardes entretenidas (1865) and *Jornadas alegres* (1866) proved that he was a novelist by vocation. Shortly afterwards he joined the household of the marquis de los Vélez, viceroy of Valencia, and published in quick succession three clever picaresque novels: *La Niño de los embustes*, *Teresa de Mazaray* (1864), *Las Aventuras del Bachiller Trepasa* (1867), and a continuation entitled *La Guarda de Sevilla* and *Anuncio de las balsas* (1864). To these shrewd cynical stories he owes his reputation. He followed the marquis de los Vélez in his disastrous campaign in Catalonia, and accompanied him to Rome, where the defeated general was sent as ambassador. Castillo Solórzano's death occurred (probably at Palermo) before 1868, but the exact date is uncertain. His prolonged absence from Madrid prevented him from writing as copiously for the stage as he would otherwise have done; but he was popular as a playwright both at home and abroad. His *Marqués del Cigarral* and *El Mayorazgo figurón* are the sources respectively of Scarron's *Don Jophet d'Arménie* and *L'Héritier ridicule*. Among his numerous remaining works may be mentioned *Las H Arpas* in Madrid (1633), *Fiestas del Jardín* (1634), *Los Alivios de Casandra* (1640) and the posthumous Quinta de Laurel (1649); the witty observation of these books forms a singular contrast to the prime devotion of his *Sagrario de Valencia* (1635). His versatility and graceful style deserve the highest praise. (J. F.-K.)

CASTLE (Lat. *castellum*, a fort, diminutive of *castra*, a camp; Fr. *château* and *châtelet*), a small self-contained fortress, usually of the middle ages, though the term is sometimes used of prehistoric earthworks (e.g. Hollingbury Castle, Maiden Castle), and of some citadels (e.g. the castles of Badajoz and Burgos), and a small detached fort or tower (e.g. in modern times. It is also often applied to the principal mansion of a prince or nobleman, and in France (as *château*) to any country seat, this use being a relic of the feudal age. Under its twofold aspect of a fortress and a residence, the medieval castle is inseparably connected with the subjects of fortification (see *Fortification* and *Siegecraft*) and architecture (q.v.). An account of Roman and pre-Roman castella in Britain will be found under BRITAIN.

The word "castle" (castel) was introduced into English shortly before the Norman Conquest to denote a type of fortress, then new to the country, brought in by the Norman knights whom Edward the Confessor had sent for to defend Herefordshire against the inroads of the Welsh. Richard's castle, of which the earthworks remain and which has given its name to a parish, was erected at this period on the border of Herefordshire and Shropshire by Richard Fitz Gisbro. The essential feature of this type was a circular mound of earth surrounded by a dry ditch and flattened at the top. Around the crest of
its summit was placed a timber palisade. This motte was styled in French motte (latinized molte), a word still common in French place-names. It is clearly depicted at the time of the

Conquest in the Bayeux tapestry, and was then familiar on the mainland of western Europe. A description of this earlier castle is given in the life of John, bishop of Hereford (Acta

Sanctorum, March 10), and of its replacement by a castle of Merchem, built by "a lord of the town many years before" may be taken as typical of the practice of the 13th century.

But in addition to the mound, the citadel of the fortress, there was usually appended to it a bailey or bascouse (and sometimes two) of semicircular or horseshoe shape, so that the mound stood d

cheval on the line of the enceinte. The rapidity and ease with which it was possible to construct castles of this type made them characteristic of the Conquest period in England and of the Anglo-Norman settlements in Wales, Ireland and the Scottish lowlands. In later days a stone wall replaced the timber palisade and produced what is known as the shell-keep, the type met with in the extant castles of Berkeley, Alnwick and Windsor.

But the Normans introduced also two other types of castle. The one was adopted where they found a natural rock stronghold which, only needed adaptation, as at Clifford, Ludlow, the Peak and Exeter, to produce a citadel; the other was a type wholly distinct, the high rectangular tower of masonry, of which the Tower of London is the best-known example, though that of Colchester was probably constructed in the 11th century also. But the latter type belongs rather to the more settled conditions of the 12th century when haste was not a necessity, and in the first half of which the fine extant keeps of Hedingham and Rochester were erected. These towers were originally surrounded by palisades, usually on earthen ramparts, which were replaced later by stone walls. The whole fortress thus formed was styled a castle, but sometimes more precisely "tower and castle," the former being the citadel, and the latter the walled enclosure, which preserved more strictly the meaning of the Roman castellum.

Reliance was placed by the engineers of that time simply and solely on the inherent strength of the structure, the walls of which defied the battering-ram, and could only be undermined at the cost of much time and labour, while the narrow apertures were constructed to exclude arrows or flaming brands.

At this stage the crusades, and the consequent opportunities, afforded to western engineers of studying the solid fortresses of the Byzantine empire, revolutionized the art of castle-building, which henceforward follows recognized principles. Many castles were built in the Holy Land by the crusaders of the 12th century, and it has been shown (Oman, Art of War: the Middle Ages, p. 529) that the designers realized, first, that a

second line of defences should be built within the main enceinte, and a third line or keep inside the second line; and secondly, that a wall must be flanked by projecting towers. From the Byzantine engineers, through the crusaders, we derive, therefore, the cardinal principle of the mutual defence of all the parts of a fortress. The donjon of western Europe was regarded as the fortress, the outer walls as accessory defences; in the East each envelope was a fortress in itself, and the keep became merely the last refuge of the garrison, used only when all else had been captured. Indeed the keep, in several crusader castles, is no more than a tower, larger than the rest, built into the enceinte and serving with the rest for a flank defence, while the fortress was made strongest on the most exposed front. The idea of the flanking towers (which were a type very different from the slight projections of the shell-keep and rectangular tower) soon penetrated to Europe, and Alnwick Castle (1140-1150) shows the influence of the new system. But the finest of all castles of the Middle Ages was Richard Cœur de Lion's fortress of Château Gaillard (1197) on the Seine near Les Andelys. Here the innermost ward was protected by an elaborate system of strong appended defences, which included a strong
tete-de-pont covering the Seine bridge (see Clark, i. 384, and Oman, p. 533). The castle stood upon high ground and consisted of three distinct enceintes or wards besides the keep, which was in this case merely a strong tower forming part of the innermost ward. The donjon was rarely defended à outrance, and it
...gradually sank in importance as the outer “wards” grew stronger. Round instead of rectangular towers were now becoming usual, the finest examples of their employment as keeps being at Conisborough in England and at Coucy in France. Against the relatively feeble siege artillery of the 13th century a well-built fortress was almost proof, but the mines and the battering ram of the attack were more formidable, and it was realized that corners in the stonework of the fortress were more vulnerable than a uniform curved surface. Château Gaillard fell to Philip Augustus in 1204 after a strenuous defence, and the success of the assailants was largely due to the wise and skilful employ-ment of mines. An angle of the noble keep of Rochester was undermined and brought down by John in 1215.

The next development was the extension of the principle of successive lines of defence to form what is called the “concentric” castle, in which each ward was placed wholly within another which enveloped it; places thus built on a flat side (e.g. Caerphilly Castle) became for the first time more formidable than strongholds perched upon rocks and hills such as Château Gaillard, where the more exposed parts indeed possessed many successive lines of defence, but at other points, for want of room, it was impossible to build more than one or, at most, two walls. In these cases, the fall of the inner ward by surprise, escalade, vive force, or even by regular siege (as was sometimes feasible), entailed the fall of the whole castle.

The adoption of the concentric system precluded any such mischance, and thus, even though siege-engines improved during the 13th and 14th centuries, the defence, by the massive strength of the concentric castle in some cases, by natural inaccessibility of position in others, maintained itself superior to the attack during the latter middle ages. Its final fall was due to the introduction of gunpowder as a propellant. “In the 14th century the change begins, in the 15th it is fully developed, in the 16th the feudal fastness has become an anachronism.”

The general adoption of cannon placed in the hands of the central power a force which ruined the baronial fortifications in a few days of firing. The possessors of cannon were usually private individuals of the middle classes, from whom the prince hired the materiel and the technical workmen. A typical case will be found in the history of Brandenburg and Prussia (Carlyle, Frederick the Great, bk. iii. ch. i.), the impregnable castle of Friesack, held by an intractable feudal noble, Dietrich von Quitzow, being reduced in two days by the elector Frederick I, with “Heavy Peg” (Faule Grete) and other guns hired and borrowed (February 1414). The beginnings of orderly government in Brandenburg thus depended upon the guns, and the taking of Friesack is, in Carlyle’s phrase, “a fact memorable to every Prussian man.” In England, the earl of Warwick in 1464...
reduced the strong fortress of Bamborough in a week, and in Germany, Franz von Sickingen's stronghold of Landstuhl, formerly impregnable on its heights, was ruined in one day by the artillery of Philip of Hesse (1525). Very heavy artillery was used for such work, of course, and against lighter natures, some castles and even fortified country-houses or castellated mansions managed to make a stout stand even as late as the Great Rebellion in England.

The castle thus ceases to be the fortress of small and ill-governing local magnates, and its later history is merged in that of modern fortification. But an interesting transitional type between the medieval stronghold and the modern fortress is found in the coast castles erected by Henry VIII., especially those at Deal, Sandown and Walmer (c. 1540), which played some part in the events of the 17th century, and of which Walmer Castle is still the official residence of the lord warden of the Cinque Ports. Viollet-le-Duc, in his *Annals of a Fortress* (English trans.), gives a full and interesting account of the repeated renovations of the fortress on his imaginary site in the valley of the Doubs, the construction by Charles the Bold of artillery towers at the angles of the castle, the protection of the masonry by earthen outworks, boulevards and demi-boulevards, and, in the 17th century, the final service of the medieval walls and towers as a pure *enceinte de sûreté*. Here and there we find old castles serving as *forts d'arrêt* or block-houses in mountain passes and defiles, and in some few cases, as at Dover, they formed the nucleus of purely military places of arms, but normally the castle falls into ruins, becomes a peaceful mansion, or is merged in the fortifications of the town which has grown up around it. In the *Annals of a Fortress* the site of the feudal castle is occupied by the citadel of the walled town, for once again, with the development of the middle class and of commerce and industry, the art of the engineer came to be displayed chiefly in the fortification of cities. The baronial "castle" assumes *pari passu* the form of a mansion, retaining indeed for long some capacity for defence, but in the end losing all military characteristics save a few which survived as ornaments. Examples of such castellated mansions are seen in Wingfield Manor, Derbyshire, and Hurstmonceux, Sussex, erected in the 15th century, and

![From Clark's Med. M11. Arch.](image1)

**Fig. 9.—Beaumaris Castle: Plan.**

nearly all older castles which survived were continually improved and altered to serve as residences.

(C. F. A.)

**Influence of Castles in English History.**—Such strongholds as existed in England at the time of the Norman Conquest seem to have but little resistance to William the Norman, who, in order effectually to guard against invasions from without as well as to awe his newly-acquired subjects, immediately began to erect castles all over the kingdom, and likewise to repair and augment the old ones. Besides, as he had parcelled out the lands of the English amongst his followers, they, to protect themselves from the resentment of the despoiled natives, built strongholds and castles on their estates, and these were multiplied so rapidly during the troubled reign of King Stephen that the "adulterine" (i.e. unauthorized) castles are said by one writer to have amounted to 1115.

In the first instance, when the interest of the king and of his barons was identical, the former had only retained in his hands the castles in the chief towns of the shires, which were entrusted to his sheriffs or constables. But the great feudal revolts under the Conqueror and his sons showed how formidable an obstacle to the rule of the king was the existence of such castles in private hands, while the people hated them from the first for the oppressions connected with their erection and maintenance. It was, therefore, the settled policy of the crown to strengthen the royal castles and increase their number, while jealously keeping in check those of the barons. But in the struggle between Stephen and the empress Maud for the crown, which became largely a war of sieges, the royal power was relaxed and there was an outburst of castle-building, without permission, by the barons. These in many cases acted as petty sovereigns, and such was their tyranny that the native chronicler describes the castles as "filled with devils and evil men." These excesses paved the way for the pacification at the close of the reign, when it was provided that all unauthorized castles constructed during its course should be destroyed. Henry II., in spite of his power, was warned by the great revolt against him that he must still rely on castles, and the massive keeps of Newcastle and of Dover date from this period.

Under his sons the importance of the chief castles was recognized as so great that the struggle for their control was in the forefront of every contest. When Richard made vast grants at his accession to his brother John, he was careful to reserve the possession of certain castles, and when John rose against the king's minister, Longchamp, in 1191, the custody of castles was the chief point of dispute throughout their negotiations, and Lincoln was besieged on the king's behalf, as were Tickhill, Windsor and Marlborough subsequently, while the siege of Nottingham had to

![From Clark's Med. M11. Arch.](image2)

**Fig. 10.—Beaumaris Castle: View.**

be completed by Richard himself on his arrival. To John, in turn, as king, the fall of Château Gaillard meant the loss of Rouen and of Normandy with it, and when he endeavoured to repudiate the newly-granted Great Charter, his first step was to prepare the royal castles against attack and make them his centres of resistance. The barons, who had begun their revolt by besieging that of Northampton, now ascalled that of Oxford as well and

**Fig. 12.—Caerphilly Castle: View.**
seized that of Rochester. The king recovered Rochester after a severe struggle and captured Tonbridge, but thenceforth there was a war of faction between John, with his mercenaries and Louis of France with his Frenchmen, and the barons, which was specially notable for the great defence of Dover Castle by Hubert de Burgh against Louis. On the final triumph of the royal cause, after John's death, at the battle of Lincoln, the general pacification was accompanied by a fresh issue of the Great Charter in the autumn of 1217, in which the precedent of Stephen's reign was followed and a special clause inserted that all "adulterine" castles, namely those which had been constructed or rebuilt since the breaking out of war between John and the barons, should be immediately destroyed. And special stress was laid on this in the writs addressed to the sheriffs.

In 1223 Hubert de Burgh, as regent, demanded the surrender to the crown of all royal castles not in official custody, and though he succeeded in this, Falke de Breauté, John's mercenary, burst into revolt next year, and it cost a great national effort and a siege of nearly two months to reduce Bedford Castle, which he had held. Towards the close of Henry's reign castles again asserted, in the Baron's War, their importance. The Provosts of Oxford included a list of the chief royal castles and of their appointed castellans with the oath that they were to take; but the alien favourites refused to make way for them till they were forcibly ejected. When war broke out it was Rochester Castle that successfully held Simon de Montfort at bay in 1264, and in Pevensey Castle that the fugitives from the rout of Lewes were able to defy his power. Finally, after his fall at Evesham, it was in Kenilworth Castle that the remnant of his followers made their last stand, holding out nearly five months against all the forces of the crown, till their provisions failed them at the close of 1266.

Thus for centuries after the Norman Conquest castles had proved of primary consequence in English political struggles, revolts and warfare. And, although, when the country was again free from alien rule, the civil strife, their subjects warring among themselves, and their kings warring among themselves, the crown's historic jealousy of private fortification was still seen in the need to obtain the king's licence to "crenellate" (i.e. embattle) the country mansion.

BIBLIOGRAPHY—C. T. Clark, Medieval Military Architecture in England (2 vols.), includes a few French castles and is the standard work on the subject, but inaccurate and superseded on some points by recent research; Professor Oman's Art of War in the Middle Ages (1901) in the subject but short is the chapter of his History of the World: Clive of India, "The Burgher,"ies: Deville, Histoire du Château-Gaillard (1829) and Château d'Aiguers (1839); Viollet-le-Duc's Essay on the Military Architecture of France (1866); and Macdertmot's Histoire de l'Angleterre (1850). More recent studies will be found in J. H. Round's Geoffrey de Mandeville (1891); "English Castles" (Quarterly Review, July 1894); and "Castles of the Conquest" (Archeologia, LII., 1892); "The Kingdom of the Malt-house" (Archaeol. J., 1892); Mrs Armitage's "Early Norman Castles of England" (Eng. Hist. Review, xvi., 1904), and her papers in Scot. Soc. Art. Proc. xxvii., and The Antiquary, July, August, 1908; G. H. Orpen, "The Malt House in Norman Scotland," (Scottish Review, iv., 1898); G. H. Orpen, "Motes and Norman Castles in Ireland" (Eng. Hist. Review, xxi., 1906-1907). (J. H. R.)

CASTLEBAR, a market town and the county town of Co. Mayo, Ireland, in the west parliamentary division, on the river and near the lough of the same name, on the Manulla and Westport branch of the Midland Great Western railway. Pop. of urban district (1901) 3,585. The county court buildings and other public offices occupy a square, and there is a pleasant mall shaded by fine trees. There are some breweries, and trade in linens and agricultural produce. The castle, which gives its name to the town, was a fortress of the De Burgh family; but the town itself was founded in the reign of James I., and received a charter from him in 1613. In 1641 the castle was held for the parliament by Sir Henry Bingham, but he was forced to surrender to Lord Mayo, and fell a victim, with all his garrison, to the fury and treachery of the besiegers. The massacre was afterwards avenged in 1653 by the execution of Sir Theobald Burke (that time Lord Mayo), who had been in command along with his father at the siege. In 1728 the town was occupied for some weeks by the French under General J. J. Humbert, who had defeated the English under Luke Hutchison in a conflict which is jocularly styled the "Castlebar Races." The town returned two members to the Irish parliament until the Union. Four miles N.E. of Castlebar is Turlough, with a round tower 70 ft. high and 57 ft. in circumference, and other remains.

CASTLECONNELL, a village of Co. Limerick, Ireland, on the left bank of the Shannon, 8 m. N.E. of Limerick on the Great Southern & Western railway. It possesses a spa which was once considerably frequented, but is famous as a centre for the salmon fishing on the lower Shannon. Castleconnell is so intimately connected with this sport that it has given its name to a favourite pattern of fly-rod, in which a movable splice takes the place of the usual metal joint. The beautiful rapids of Doonas (avoided by a canal) are in the neighbourhood, and the surrounding scenery is generally attractive. There are remains of a castle from which the town took its name, which was the seat of the kings of Thomond, and was blown up by General Ginkel at the time of the siege of Limerick (1690).

CASTLE DONINGTON, a town in the Loughborough parliamentary division of Leicestershire, England, 12 3/4 m. N.N.W. from London, on the Trent Junction and Western branch of the Midland railway. Pop. (1901) 5,324. It lies on the flank of the hills overlooking the Trent and Soar valleys. There are slight remains of the castle. The church of St Luke is a fine building of Early English and later date. Donington Park, a neighbouring mansion, was offered to refugees during the French Revolution in 1830, and Charles X. availed himself of this retreat. Hosiery, silk and baskets are manufactured. Castle Donington is 2 1/2 m. west of Kegworth station on the Midland main line.

Kegworth (pop. 2,078) on the Soar, has a hosiery and knitting industry.

CASTLE DOUGLAS, a burgh of barony and police burgh of Kirkcudbrightshire, Scotland. Pop. (1901) 3,018. It is situated on Carlingwark Loch, 1 1/2 m. S.W. of Dumfries by the Glassgow & South Western railway. Its auction marts for sheep and cattle sales are the largest in the south-west of Scotland; at an autumn sale as many as 15,000 sheep and 1400 cattle are disposed of in one day. The leading industries comprise the making of agricultural implements and mineral waters, besides tanning. The Macmillan Free Church perpetuates the memory of John Macmillan (d. 1753), the Cameronian, who helped to found the Reformed Presbyterian Church. He had been chaplain to Murray of Broughton, and afterwards became minister of Balmagie, about 3 1/2 m. N.W. of Castle Douglas. The town is the chief centre of business in East Galloway, and it is also resorted to in midsummer for its beautiful scenery and excellent fishing. Till 1765 it was only a village under the name of Causewayhead, but the discovery of marble in the lake brought it some prosperity, and it was purchased in 1792 by Sir William Douglas and called after him. Since then its progress has been continuous. Carlingwark Loch contains several islets, on one of which is a crannog, or ancient lake dwelling.

CASTLEFORD, an urban district in the Osogoldcross parliamentary division of the West Riding of Yorkshire, England, on the river Aire near its junction with the Calder, 9 m. S.E. of Leeds, on the North-Eastern and Lancashire & Yorkshire railways. Pop. (1901) 17,386. Large glass-bottle and earthenware-jar works, chemical works, and neighbouring collieries employ the inhabitants. Here was the Roman village or fort of Lagetum or Leogetum; and though visible remains are wanting, a number of relics have been discovered.

CASTLE-GUARD, an arrangement under the feudal system, by which the duty of finding knights to guard royal castles was imposed on certain baronies, and divided among their knight's fees. The greater barons provided for the guard of their castles by exacting a similar duty from their knights. In both cases the obligation was commuted very early for a fixed money payment, which, as "castle-guard rent" lasted on to modern times.

CASTLEMAINE—CASTOR AND POLLUX

CASTLEMAINE, a town of Talbot county, Victoria, Australia, 78 m. by rail N.N.W. of Melbourne. Pop. (1901) 1704. The gold-mines here were among the first discovered in the colony, and dredging for gold is carried on in Barker's and Forrest creeks, at the junction of which the town stands. Slate and flagstone are largely quarried in the district, which also produces wine and much fruit, especially apples. Castlemaine has a reputation as a health resort in cases of pulmonary complaints.

CASTLE RISING, a village of Norfolk, England, 4 m. by road N.E. of King's Lynn. The Norman castle for which it is famous stands on slightly elevated ground overlooking, to the west, the low marshy coast of the Wash. Its site is enclosed by artificial ramparts of earth and a dyke which is crossed by an ancient bridge. The keep is square and massive, and fairly perfect, and it is not difficult to reconstruct the arrangement of the rooms. In some parts, especially the entrance, the Norman carving is very rich. The foundations of a small chapel with apsidal eastern termination have been discovered outside the castle. The village of Castle Rising is the decayed remnant of a town of no little importance. Its church of St Laurence is late Norman, with much rich ornamentation; it shows traces of considerable alterations in the Early English period, but is an admirable example of the earlier style.

It is a matter of dispute whether Rising was or was not an early Saxon settlement; in Domesday Book the manor is given as having belonged to Archbishop Stigand, from whom it had passed to Odo of Bayeux, whose estates were confiscated in 1088. Granted to William de Albini, whose son built Rising Castle, it passed first to Robert de Montalt, and then by sale to Isabel, queen of England, in 1332, remaining in the possession of the crown until Henry VIII. exchanged it for other lands with the Duke of Norfolk. In 1569 an inquisition found that the lord had the return of all rents. In 1769 Robert de Montalt died seized of the manor and vill with the assize of bread and ale. An inquisition of 1379, although it makes no mention of the borough, states that the lord has the rents of assizes, and perquisites of the courts with view of frank-pledge. A mayor is first mentioned in 1343, and a borough existed in the 15th century. A survey of 1589-1590 declared that Castle Rising was an ancient borough by prescription according to the grant made to Hugh de Albini by Henry III. In 1589-1590 the recorder was chosen by the lord of the manor. The mayor, the only member of the corporation, whose sole duty was the holding of the assize of bread and ale, was chosen by the burgesses and presented at the court leet for confirmation. Castle Rising became a parliamentary borough in 1558, but was disfranchised in 1832 and the corporation abolished in 1835, although a mayor was elected for special purposes until 1883. Having no manufactures, the trade of the town depended entirely on its fairs and markets; but these have been long obsolete.

CASTLETON, a village in the High Peak parliamentary division of Derbyshire, England, 17 m. W.S.W. of Sheffield, and 2 m. from Hope station on a branch of the Midland railway. Pop. (1901) 547. Lying itself at an elevation of about 600 ft., it is surrounded on the north, west, and south by hills from 1400 to 1700 ft. in height, rising sharply, and in parts precipitously. The village is celebrated for its situation in the midst of the wild Peak country, for the caves and mines in the neighbourhood, and for the Castle of the Peak, the ruins of which are strongly placed on a cliff immediately above the village. The Peak Cavern or Devil's Hole, penetrating this cliff, is the most magnificent in Derbyshire. For many generations the entrance to this cave has served as a workshop, held free of rent, to families employed in the shape and size making of Lanterns. Speedwell Cavern is some 17 miles further in, and more than half a mile from the west entrance, with a very extensive and fine chamber. The Caves are some 50 m. from the present village, and are a great source of local interest, as they are the home of the Derbyshire Devil and the first page of the 'Smithy Stone.' The caverns were opened to the public in 1838. The Caves are open on Sunday afternoons, and during school holidays. The caverns are under the care of the Derbyshire Caves Committee. The castle is a ruin, but remains a romantic and interesting feature in the district.

CASTLETON, retains a fine Norman chancel arch, and the vestry contains a valuable library. At Brough near Castleton was a Roman fort, established to hold in check the hillmen of the Peak. It was connected by roads with Buxton, Manchester and Rotherham. The Castle of the Peak, or Peveril Castle, is famous through Sir Walter Scott's novel Peverel of the Peak. Early earthworks, which, extending from below the castle in a semi-circle, enclosed the town, can still in great part be traced. Before the Conquest the site was held by Gerneburn and Hundine, and was granted by the Conqueror to William Peverell, by whom the castle was built. On the forfeiture of William Peverell, grandson of the first holder, it was granted by Henry II. to Prince John who, in 1204, made Hugh Nevill governor of the castle. In 1216 William Ferrers, earl of Derby, took it from the rebellious barons, and was made governor by Henry III., who in 1223 granted a charter for a weekly market at the town. In 1328 the castle was granted to John of Gaunt on his marriage with Blanche of Lancaster, and thus became parcel of the duchy of Lancaster. The castle has often been used as a prison, and from its position was almost impregnable.

CASTLETOWN (Manx, Bully Cashiel), a town of the Isle of Man, 10 m. S.W. of Douglas, by the Isle of Man railway. Pop. (1901) 1075. It is picturesquely situated on both sides of a small harbour formed by the outflow of the Silver Burn into Castletown Bay. It was the legal capital of the island until 1862. In the centre of the town stands Castle Rushen, which is said to owe its foundation to the Danish chief, Guthred, in 947-950, though the existing building, which is remarkably well preserved, probably dates from the 14th century. Until the 18th century it was the residence of the lords of Man, and until 1891 served as a prison. The massive keep is square, and is surrounded by an outer wall, with towers and a moat. The council chamber and court-house were built in 1644. In the neighbourhood of the castle is the old House of Keys, where the members of the Manx parliament held their sessions until the removal of the seat of government to Douglas. A lofty Doric column commemorates Cornelius Smelt, lieutenant-governor of the island (d. 1832), near which there is a remarkable sun-dial with thirteen faces, dating from 1720. King William's College, situated a mile to the north-east of the town, was opened in 1833, but a complete restoration was rendered necessary by fire in 1844, and it was subsequently enlarged. It is the chief educational establishment in the island. At Hango Hill near the town William Christian, receiver-general, who had surrendered the castle, and with it the island, to the parliamentary forces in 1651, was executed in 1665 at the instance of the countess of Derby, who had undertaken to defend it for the king. A small shipping trade is maintained.

CASTOR and POLLUX (Gr. Πολύδωροι), in Greek and Roman mythology, the twin sons of Leda, and brothers of Helen and Clytemnestra. They were also known under the name of Dioscuri (Διόσκουροι), later Διόσκουροι, children of Zeus), for, according to later tradition, they were the children of Zeus and Leda, whose love the god had won under the form of a swan. In some versions Leda is represented as having brought forth two eggs, from one of which were born Castor and Pollux, from the other Helen. In another account, Zeus is the father of Pollux and Helen, Tyndareus (king of Sparta) of Castor and Clytemnestra. In Homer, Castor, Pollux and Clytemnestra are said to be the children of Tyndareus and Helen, Helen the daughter of Leda by Zeus. The Dioscuri were specially revered among people of Dorian race, and were said to have reigned at Spartan for many years after they were buried. They were specially adored, especially in Argolis, by poets and protectors (Διόσκουροι, Διόσκουροι). Sailors in a storm prayed to them (Horace, Odes, i. 3) and sacrificed a white lamb, whereupon they were wont to appear in the form of fire at the masthead (probably referring to the phenomenon of St Elmo's fire), and the storm ceased. Later, they were confounded with the Samothracian Cabeiri. In battle they appeared riding on white horses and gave victory to the side they favoured. They were the patrons of hospitality, and founded the sacred festival called Theoxenia.
CASTOR OIL—CASTRÉN

They presided over public games, Castor especially as the horse-tamer, Pollux as the boxer; but both are represented as riding on horseback or driving in a chariot. In Sparta their ancient symbol was two parallel beams (dikaea), connected by cross-bars, which the Spartans took with them into the field (Plutarch, De Fraterno Amore, 1; Herodotus v. 73); later, they were represented by two amphorae with snakes winding round them. The most common exploits were the invocation of Attacus, to rescue their sister Helen from Theseus; their share in the hunting of the Calydonian boar (see MELEAGER) and the Argonautic expedition, and their battle with the sons of Aphares, brought about by a quarrel in regard to some cattle, in which Castor, the mortal (as the son of Tyndareus), fell by the hand of Idas. Pollux, finding him dead after the battle, implored Zeus to be allowed to die with him; this being impossible by reason of his immortality, Pollux was permitted to spend alternately one day among the gods, the other in Hades with his brother. According to another fabula, the god marked his approval of their love by placing them together in the sky, as the Twins or the morning and evening star (Hyginus, Poet. Astronom. li. 22). Like the Asvins of the Veda, the bringers of light in the morning sky, with whom they have been identified, the Dioscuri are represented as youthful horsemen, naked or wearing only a light chlamys. Their characteristic attribute is a pointed egg-shaped case suspended from the neck.

Though their worship was perhaps most carefully observed among people of Dorian origin, Castor and Pollux were held in no small veneration at Rome. It was the popular belief in that city from an early period that the battle of Lake Regillus had been decided by their interposition (Dion. Halic. vi. 13). They had fought, it was said, armed and mounted, at the head of the legions of the commonwealth, and had afterwards carried the news of the victory with incredible speed to the city. The well in the Forum at which they alighted was pointed out, and near it rose their ancient temple, in which the senate often held its sittings. On the 15th of July, the supposed anniversary of the battle, a great festival with sumptuous sacrifices was celebrated in their honour, and a solemn parade of the Roman knights (transvectio equitum), who looked upon the Dioscuri as their patrons, took place. (Apollodorus iii. 10. 7, 11. 2; Homer, Odyssey, x. 299; Hyginus, Fab. 77, 155; Pindar, Nem. x. 66, 86 and schol.; Diol. Sic. iv. 43; Plutarch, Theseus, 32, 335. Theocritus, Idyll, xxii.)

Furtwängler in Keplers Lexicon der Mythologie; and by M. Alber in Darmenf and Saglio's Dictionnaire des antiquités.

CASTOR OIL, the fixed oil obtained from the seeds of the castor oil plant or Palma Christi, Ricinus communis, belonging to the natural order Euphorbiaceae. The botanical name is from Lat. ricinus, a tick, from the form of the seed and markings of the seed. The plant is a native of tropical Africa, but it has been introduced, and is now cultivated in most tropical and in the warmer temperate countries. In size it varies from a shrubby plant to a tree of from 30 to 40 ft. in height according to the climate in which it grows, being arborecent in tropical latitudes. On account of its very large beautiful palmate-peltate leaves, which sometimes measure as much as 2 ft. in diameter, it is cultivated as an ornamental plant. In the south of England, with the habit of an annual, it ripens its seeds in favourable seasons; and it has been known to come to maturity as far north as Christiansland in Norway. Plants are readily grown from seed, which should be sown singly in small pots and placed in heat early in March. The young plants are kept under glass till early in June when they are hardened and put out. The fruit consists of three-celled capsule, covered externally with soft yielding prickles, and each cell develops a single seed. The seeds of the different cultivated varieties, of which there are a great number, differ much in size and in external markings; but average seeds are of an oval, laterally compressed form, with their longest diameter about four lines. They have a shining, metallic-grey and brown, thick, leathery outer coat, within which is a thin dark-coloured brittle coat. A large distinct leafy embryo lies in the middle of a dense, oily tissue (endosperm). The seeds contain a toxic substance, which makes them actively poisonous; so much so that three have been known to kill an adult.

The oil is obtained from the seeds by two principal methods—expression and decoction—the latter process being largely used in India, where the oil, on account of its cheapness and abundance is extensively employed for illuminating as well as for other domestic and medicinal purposes. The oil exported from Calcutta to Europe is prepared by shelling and crushing the seeds between rollers. The crushed mass is then placed in hemp cloths and pressed in a screw or hydraulic press. The oil which exudes is mixed with water and heated till the water boils, and the mucilaginous matter in the oil separates as a scum. It is next strained, then bleached in the sunlight, and stored for exportation. A considerable quantity of castor oil of an excellent quality is also made in California; the manufacture is conducted on an extensive scale. The following is an outline of the process adopted in a Californian factory. The seeds are submitted to a dry heat in a furnace for an hour or thereby, by which they are softened and prepared to part easily with their oil. They are then pressed in a large powerful screw-press, and the oily matter which flows out is caught, mixed with an equal proportion of water, and boiled to purify it from mucilaginous and albuminous matter. After boiling about an hour, it is allowed to cool, the water is drawn off, and the oil is transferred to zinc tanks or clarifiers capable of holding from 60 to 100 gallons. In these it stands about eight hours, bleaching in the sun, after which it is ready for storing. By this method 100 lb. of good seeds yield about 5 gallons of pure oil.

Castor oil is a viscous liquid, almost colourless when pure, possessing only a slight odour, and a mild yet highly nauseous and disagreeable taste. Its specific gravity is ~0.96, a little less than that of water, but the oil does not dissolve freely in alcohol, ether and glacial acetic acid. It contains palmitic and several other fatty acids, among which there is one—ricinoleic acid—peculiar to itself. This occurs in combination with glycerin, constituting the greater part of the bulk of the oil.

The active principle to which the oil owes its purgative properties has not been isolated. It is, indeed, probable that it is formed in the intestine, as a result of some decomposition as yet unknown. The dose is from a drachm to an ounce. The pharmacopoeial mixture is best avoided, being almost uniquely nauseous. By far the best way to administer the oil is in capsules. It acts in about five hours, affecting the entire length of the bowel, but not increasing the flow of bile except in very large doses. The mode of its action is unknown. The oil will purge when rubbed into the skin or injected per rectum. It is an invaluable drug in temporary constipation and whenever a mild action is essential, as in pregnancy. It is extremely useful for children and the aged, but must not be employed in cases of chronic constipation, which it only aggravates, whilst relieving the symptoms.

CASTRÉN, MATTHIAS ALEXANDER (1813–1853), Finnish ethnologist and philologist, was born at Tervola, in the parish of Kemi in Finland, on the 20th of November (December 2, 1813). His father, Christian Castrén, parish minister at Rovaniemi, died in 1825; and Matthias passed under the protection of his uncle, Mathias Castrén, the kindly and learned incumbent of Kemi. At the age of twelve he was sent to school at Uleåborg, and there he helped to maintain himself by teaching the younger children. On his removal to the Alexander University at Helsingfors in 1830, he first devoted himself to Greek and Hebrew
with the intention of entering the church; but his interest was soon excited by the language of his native country, and he even began before his course was completed to lay the foundations of a work on Finnish mythology. The necessity of personal explorations among the still unwritten languages of cognate tribes soon made itself evident; and in 1838 he joined a medical fellow-student, Dr. Ehrström, in a journey through Lapland. In the following year he travelled in Russian Karelia at the expense of the Literary Society of Finland; and in 1841 he undertook, in company with Dr Elias Lönnrot, the great Finnish philologist, a third journey, which ultimately extended beyond the Ural as far as Obdonsk, and occupied a period of three years. Before starting on this last expedition he had published a translation into Swedish of the Finnish epic of Kaledola; and on his return he gave to the world his Elementa grammatices Syjureaeae and Elementa grammatices Tschermessae, 1844. No sooner had he recovered from the illness which his last journey had occasioned than he set out, under the auspices of the Academy of St Petersburg and the Helsingfors University, on an exploration of the whole government of Siberia, which resulted in a vast addition to previous knowledge, but seriously affected the health of the adventurous investigator. The first-fruits of his continued labours were published at St Petersburg in 1849, in the form of Versuch einer Sprachlehre. In 1850 he published a treatise De affinis personalibus linguarum Altaicarum, and was appointed professor at Helsingfors of the new chair of Finnish language and literature. The following year saw him raised to the rank of chancellor of the university; and he was busily engaged in what he regarded as his principal work, a Samoyedic grammar, when he died on the 7th of May 1853.

Five volumes of his collected works appeared from 1852 to 1858, containing respectively—(1) Reseninnien från åren 1838-1844; (2) Resenåretts och brof åren 1845-1849; (3) Föreläsningar i Finns mytologi; (4) Etnologiska föreläsningar öfver Altaiska fabler; and (5) Smärre afhandlinger och akademiska dissertationer. A German translation was published by Anton Schieffer, who was also entrusted by the St Petersburg Academy with the editing of his manuscripts, which had been left to the Helsingfors University and which were subsequently published.

CASTRENSIS, Paulus, an Italian jurist of the 14th century. He studied under Baldus at Perugia, and was a fellow-pupil with Cardinal Zabarella. He was admitted to the degree of doctor of civil law in the University of Vienna in the but it is uncertain when he first undertook the duties of a professor. A tradition, which has been handed down by Panzirius, represents him as having taught law for a period of fifty-seven years. He was professor at Vienna in 1360, at Avignon in 1394, and at Padua in 1429; and, at different periods, at Florence, at Bologna and at Perugia. He was for some time the vicar-general of Cardinal Zabarella at Florence, and his eminence as a teacher of canon law may be inferred from the language of one of his pupils, who styles him "famosissimus juris urbiusque monarca." His most complete treatise is his readings on the Digest, and it appears from a passage in his readings on the Digestum Vetus that he delivered them at a time when he had been actively engaged for forty-five years as a teacher of civil law. His death is generally assigned to 1436, but it appears from an entry in a MS. of the Digestum Vetus, which is extant at Munich, made by the hand of one of his pupils who styles him "praecipiter meus," that he died on the 20th of July 1441.

CASTRES, a town of south-western France, capital of an arrondissement in the department of Tarn, 30 m. S.S.E. of Albi, on the left bank of the river. Pop. (1906) 28,582; commune, 28,272. Castres, the busiest and most populous town of its department, is intersected from north to south by the Agout; the river is fringed by old houses the upper stories of which project over its waters. Wide boulevards traverse the west of the town, which is also rendered attractive by numerous fountains fed by a fine aqueduct hewn in the rock. The church of St Benoit, once a cathedral, and the most important of the churches of Castres, dates only from the 17th and 18th centuries. The hôtel de ville, which contains a museum and the municipal library, occupies the former bishop's palace, designed by Jules Mansart in the 17th century; the Romanesque tower beside it is the only survival of an old Benedictine abbey. The town possesses some old mansions of which the hôtel de Nayrac, of the Renaissance, is of most interest. Castres has a sub-prefecture, tribunals of first instance and of commerce, a board of trade-arbitrators, a chamber of commerce, a branch of the bank of France and two hospitals. There are also communal colleges for boys and girls, a school of artillery and school of draughtsmanship. The industrial establishments include manufactories of earthenware and porcelain and metal-foundries, and tanning, leather-dressing, turnery, the making of wooden shoes and furniture, the weaving of woollen and other fabrics, dyeing, and the manufacture of machinery, paper and parchment are carried on.

Castres grew up round a Benedictine abbey, which is believed to have been founded in the 7th century. It was a place of considerable importance as early as the 12th century, and ranked as the second town of the Albigenese. During the Albigenian crusade it surrendered of its own accord to Simon de Montfort; and in 1356 it was raised to a countyship by King John of France. On the confiscation of the possessions of the D'Armagnac family, to which it had passed, it was bestowed by Henry XI. on Robert del Giudicee, but the appointment led to so much disagreement that the countship was united to the crown by Francis I. in 1510. In the wars of the latter part of the 16th century the inhabitants sided with the Protestant party, fortified the town, and established an independent republic. They were brought to terms, however, by Louis XIII., and forced to dismantle their fortifications; and the town was made the seat of the chambre de l'édit, or chamber for the investigation of the affairs of the Protestants, afterwards transferred to Castelnaudary (in 1670). The bishopric of Castres, which had been established by Pope John XXII. in 1317, was abolished at the Revolution.

CASTRO, Inez de (d. 1355), mistress, and perhaps wife, of Peter I. (Pedro), king of Portugal, called Collo de Garo, i.e. "Heron's Neck," was born in Spanish Galicia, in the earlier years of the 14th century. Tradition asserts that her father, Don Pedro Fernandez de Castro, and her mother, Donna Aldoña Soares de Villadarcas, a noble Portuguese lady, were unmarried, and that Inez and her two brothers were consequently of bastard birth. They were at first attended by Cardinal Felix, bishop of Lisbon, and at 13 years of age, was betrothed by her cousin, Manuel, duke of Pefaelo, Inez grew up by side with Costanza, the duke's daughter by a son of the royal house of Aragon, and her own cousin. After refusing several crowned heads in marriage, Costanza was at last persuaded to accept the hand of the infante Dom Pedro, son of Alphonso the Proud, king of Portugal. In 1341 the two girls left Pefaelo; Costanza's marriage was celebrated in the same year, and the young infanta and her cousin went to reside at Lisbon, or at Coimbra, where Dom Pedro conceived that luckless and furious passion for Inez which has immortalized them.

The morality of the age was lax, and more especially so in Spain and Portugal, where the looseness of the marriage tie and the example of the Moors encouraged polygamy. Pedro's connexion par amour with Inez would of itself have aroused no opposition. He might even have married her, after the death of his wife in childbirth in 1345. According to his own assurance he did marry her in 1354. But by that time the rising power of the Castro family had created the most brutal hatred among the rival house, both in Spain and Portugal. Alvaro Gonzales, Pedro Coelho, and Diogo Lopes Pacheco persuaded the king, Alphonso, that his throne was in danger from an alliance between his son and the Castros, and with all the brutality of the age they urged the king to remove the danger by murdering the poor woman. The old king listened, refused, wavered and ended by yielding. He went in secret to the palace at Coimbra, where Inez and the inante resided, accompanied by his three familiars, and by others who agreed with them. The beauty and tears of Inez disarmed his resolution, and he turned to leave her; but the gentlemen about him had gone too far to recede. Inez was stabbed to death and was buried immediately in the church of Santa Clara.
CASTRO, J. De—CASTRO Y BELLVIS

The infante raised at once the flag of revolt against his father, and was only appeased by the concession of a large share in the government. The three murderers of Inez were sent out of the kingdom by Alphonso, who knew his son too well not to be aware that the vengeance would be tremendous as the crime. They took refuge in Castile. In 1357, however, Alphonso died, and the infante was crowned king of Portugal. Peter the Cruel, his nephew, reigned over Castile; and the murderers were given up as soon as required. Diogo Lopes escaped through the grati-
tude of a beggar to whom he had formerly done a kindness; but Coelho and Gonzales were executed, with terrible tortures, in the very presence of the king.

The story of the exhumation and coronation of the corpse of Inez has often been told. It is said that to the dead body, crowned and robed in royal raiment, and enthroned beside the king, the assembled nobles of Portugal paid homage as to their queen, swearing fealty on the withered hand of the corpse. The gravest doubts, however, exist as to the authenticity of this story; Fernão Lopes, the Portuguese Poet, who is the great authority for the details of the death of Inez, with some of the actors in which he was acquainted, says nothing of the ghastly ceremony, though he tells at length the tale of the funeral honours

that the king bestowed upon his wife. Inez was buried at Alcobaca with extraordinary magnificence, in a tomb of white marble, surmounted by her crowned statue; and near her sepulchre Pedro caused his own to be placed. The monument, after repeated resisting the violence of curiosity, was broken into in 1810 by the French soldiery; the statue was mutilated, and the yellow hair was cut from the broken skeleton, to be preserved in reliquaries and blown away by the wind. The children of Inez shared her habit of misfortune. From her brother, however, Alvaro Perez de Castro, the reigning house of Portugal directly descends.

See Fernão Lopes, Chronica del Rey Dom Pedro (1735); Camoens, Os Lusitânicos; Antonio Ferrerias de Inez de Castro, the first regular tragedy of the Renaissance after the Sofonisba of Trissino; Luis Velez de Guevara, Reinmar depois de morir, an elegant play; and Ferdinand Denis, Chroniques chevaleresques de l'Espagne et du Portugal.

CASTRO, JOAO DE (1500-1548), called by Camoens Castro Forte, fourth viceroy of the Portuguese Indies, was the son of Alvaro de Castro, civil governor of Lisbon. A younger son, and destined therefore for the church, he became at an early age a brilliant humanist, and studied mathematics under Pedro Nunez, in company with the infante Dom Luis, son of Emanuel the First, with whom he contracted a life-long friendship. At eighteen he went to Tangier, where he was dubbed knight by Duarte de Menezes the governor, and there he remained several years. In 1535 he accompanied Dom Luis to the siege of Tunis, where he had the honour of refusing knighthood and reward at the hands of the great emperor Charles V. Returning to Lisbon, he received from the king the small, but important, see of St. Pablo de Salavaterra in 1538. He was exceedingly poor, but his wife Lenor de Coutinho, a noble Portuguese lady, admired and appreciated her husband sufficiently to make light of their poverty. Soon after this he left for the Indies in company with his uncle Garcia de Noronha, and on his arrival at Goa enlisted among the aventureiros, “the bravest of the brave,” told off for the relief of Diu. In 1540 he served on an expedition under Estevez da Gama, by whom his son, Alvaro de Castro, a child of thirteen, was knighted, out of compliment to him. Returning to Portugal, Joao de Castro was named commander of a fleet, in 1543, to clear the European seas of pirates; and in 1545 he was sent, with six sail, to the Indies, in the room of Martin de Sousa, who had been dismissed the viceregalty. The next three years were the hardest and most brilliant, as they were the last, of his life—years of battle and struggle, of glory and sorrow, of suffering and triumph. Valiantly seconded by his sons (one of whom, Fernão, was killed before Diu) and by João Mascarenhas, Joao de Castro achieved such popularity by the overthrow of Mahmud, king of Gujarat, by the relief of Diu, and by the defeat of the great army of the Adil Khan, that he could contract a very large loan with the Goa merchants on

the simple security of his moustache. These great deeds were followed by the capture of Broach, by the complete subjugation of Malacca, and by the passage of Antonio Moniz into Ceylon; and in 1547 the great captain was appointed viceroy by Joao III, who had at last accepted him without mistrust. He did not live long to fill this charge, expiring in the arms of his friend, St. Francis Xavier, on the 6th of June 1548. He was buried at Goa, but his remains were afterwards exhumed and conveyed to Portugal, to be interred under a splendid monument in the convent of BemFica.

See Jacinto Freire de Andrada, Vida de D. Joao de Castro (Lisbon, 1851), English translation by Sir Peter Wyche (1664); Diogo de Castro, Crónica da Asia, vi. The best modern books on Castro's voyages in the East (Lisbon, 1833, 1843 and 1872) are of great interest.

CASTROGIOVANNI (Arab. Kasr-Yoni, a corruption of Castrum Eunae), a town and episcopal see of the province of Calatanissita, Sicily, 95 m. by rail S.E. of Palermo, and 56 m. W. of Catania, situated 2605 ft. above sea-level, almost in the centre of the island, and consisting of a magnificent view of the interior. Pop. (1901) 25,826. Enna was one of the cities of the Sicels, and the statement of Stephanus Byzantinus that it was colonized by Syracuse in 664 B.C. is improbable. The question is dis-
bated by E. Pais, Ataka (Pisa, 1851), 63. It does not appear in history before the time of Dionysius I. of Syracuse, who, after unsuccessful attempts, finally acquired possession of it by treachery about 397 B.C. Its natural position rendered it a fortress of great importance, and it is frequently mentioned in subsequent history. In 134-132 it was the headquarters of the slave revolt, and was only reduced by treachery. Cicero speaks of it as a place of some importance, but in imperial times it seems to have been of little account. In A.D. 837 the Saracens attempted to take it, but without success; and it was again solely by treachery that they were able to take it in 859. In 1087 it fell into the hands of the Normans; and the existing remains of fortifications are entirely medieval. There are indeed no remains of earlier days. The cathedral, founded in 1307, is of some interest. There are no remains of the famous temple of Demeter, from which Verres, as Cicero tells us, removed the bronze statue of the goddess. The lake of Pergus, where Persephone, according to one of the myths, was carried off by Hades, lies 4 m. to the south. The myth itself must have had some local origin, but has had so much Greek detail grafted upon it that the very names of the earlier Sicel deities have been displaced.

CASTRO URDIALES, a seaport of northern Spain, in the province of Santander, situated on the bay of Biscay and at the head of a branch railway connected with the Bilbao-San-
tander line. Pop. (1870) about 3500; (1900) 14,791. Castro Urdiales is a modern town, although its castle and parish church date from the middle ages. It was destroyed by the French in 1813, but speedily rebuilt and fortified. Its rapid rise in popu-
lation and prosperity dates from the increased development of iron-mining and railway communication which took place after 1870. Its chief industries are iron-mining, fishing, and the preservation of fish, especially sardines, in oil. Between 1894 and 1904 the exports of iron ore rose from 277,200 tons to 516,574 tons.

CASTRO Y BELLVIS, GUILLÉN DE (1560-1611). Spanish dramatist, was a Valencian by birth, and early enjoyed a reputation as a man of letters. In 1591 he became a member of a local literary academy called the Nocturnos. At one time a captain of the coast-guard, at another the protégé of Benavente, vicerey of Naples, who appointed him governor of Scigliano, patronized by Osuna and Olivares, Castro was nominated a knight of the order of Santiago in 1623. He settled at Madrid in 1626, and died there on the 28th of July 1631 in such poverty that his funeral expenses were defrayed by charity. He probably made the acquaintance of Lope de Vega at the festivals (1629-1622) held to commemorate the beatification and canoniza-
tion of St. Isidore, the patron saint of Madrid. On the latter occasion Castro's octavas were awarded the first prize. Lope de Vega dedicated to him a celebrated play entitled Las Almehas
CASTRUCCIO—CASUISTRY

485

de Toro (1619), and when Castro's Comedias were published in 1618–1621 he dedicated the first volume to Lope de Vega's daughter. The drama that has made Castro's reputation is Los Mocedades del Cid (1599), to the first part of which Cornelle was largely indebted for the materials of his tragedy. The two parts of this play, like all those by Castro, have the genuine ring of the old romances; and, from their intense nationality, no less than for their primitive poetry and flowing versification, were among the most popular pieces of their day. Castro's Fuera de la costumbre is the source of Love's Care, a play ascribed to Fletcher. He is also the reputed author of El Prodigio de los Montes, from which Calderón derived El Mágico prodigioso. Los Mocedades del Cid (Toulouse, 1890) and Ingratitude de amor (Philadelphia, 1899) have been well edited by E. Mérimee and H. A. Remmert respectively.

CASTRUCCIO CASTRACANI DEGLI ANTELMINELLI (1251–1328), duke of Lucca, was by birth a Lucchese, and by descent and training a Ghibelline. Being exiled at an early age with his parents and others of their faction by the Guelphs, then in the ascendant, and orphaned at nineteen, he served as a condottiere under Philip IV. of France in Flanders, later with the Visconti in Lombardy, and in 1313 under the Ghibelline chief, Ugucione della Faggiuola, lord of Pisa, in central Italy. He assisted Ugucione in many enterprises, including the capture of Lucca (1314) and the victory over the Florentines at Montecatini (1315). An insurrection of the Lucchese having led to the expulsion of Ugucione and his party, Castruccio regained his freedom and his position, and the Ghibelline triumph was presently assured. Elected lord of Lucca in 1316, he warred incessantly against the Florentines, and was at first the faithful adviser and staunch supporter of Frederick of Austria, who made him vicar imperial of Lucca in 1320. After the battle of Milhbach he went over to the emperor Louis the Bavarian, whom he served for many years. In 1325 he defeated the Florentines at Altopascio, and was appointed by the emperor duke of Lucca, Pistoja, Volterra and Luni, and two years later he captured Pisa, of which he made imperial vicar. But, subsequently, he was forced to make concessions to Lucca to have grown less friendly and he was afterwards excommunicated by the papal legate in the interest of the Guelphs. At his death in 1328 the fortunes of his young children were wrecked in the Guelphic triumph.

Niccolò Machiavelli's Life of Castruccio is a mere romance; it was translated into French, with notes, by Dres de Rader in 1755. See Niccolò Negroni, Vita di Castruccio (Modena, 1496); Winkler's Castruccio, Herr von Lucca (Berlin, 1891); and Bolan.Buitenzorg, Casaurina, 1890.

CASTRUM MINERVAE (mod. Castro), an ancient town of the Sallentini in Calabria, 10 m. south of Hydruntum, with an ancient temple of Minerva, said to have been founded by Idomeneus, who formed the tribe of the Sallentini from a mixture of Cretans, Illyrians and Italian Locrians. It is also said to have been the place where Aegeus first landed in Italy, the port of which he named Portus Veneti. The temple had lost some of its importance in Strabo's day.

CASUARINA, a genus of trees containing about 30 species, chiefly Australian, but a few Indo-Malayan. The long whip-like green branches are longitudinally grooved, and bear at the nodes whorls of small scale-leaves, the shoots resembling those of Equisetum (horse-tail). The flowers are unisexual; the staminate are borne in spikes, each flower consisting of a central stamen which is surrounded by two scale-like perianth-leaves. The pistillate are borne in dense spherical heads; each flower stands in the axil of a bract and consists of two united carpels flanked by a pair of bracteoles; the long styles hang out beyond the bracts, and the one-chambered ovary contains two ovules. In the fruit the bracteoles form two woody valves between which is a nut; the aggregate of fruits resemble small cones. Pollen is transferred by the wind to the long styles. The pollen tube does not penetrate the ovule through the micropyle but enters at the opposite end—the chalaza. This anomaly was discovered by Dr. M. Treub (see Annal. Jardin Botan. Butenoom, x. 1891), and is associated with a peculiar development of the ovule, and an increased number and peculiar form of the embryosacs (nucleospores). Treub proposed to separate Casuarina as a distinct group of Angiosperms, and suggested the following arrangement—

Angiosperms—

Poragamae

Dicotyledons.

Monocotyledons.

Chalazogamae (Casuarina).

The names of the two subdivisions recall the manner of entrance of the pollen-tube. More recent investigations, chiefly by NAWASCHIN and Miss Benson, on members of the orders Betulaceae, Fagaceae, Juglans and Ulmus, showed a recurrence in a greater or less degree of the various anomalies previously observed in Casuarina, and suggest that the affinity of Casuarina is with these orders of Dicotyledons.

The wood is very hard, and several species are valuable timber trees. From a fancied resemblance of the wood to that of the oak these trees are known as "oaks," and the same species has different names in different parts such as "she-oak," "swamp-oak," "shingle-oak," "river-oak," "iron-wood," "beet-wood," &c.

See J. H. Maiden, Useful Native Plants of Australia (London and Sydney, 1890).

CASUISTRY (from the Lat. castus, a point of law), the art of bringing general moral principles to bear on particular actions. It is, in short, applied morality; anybody is a casuist who reflects about his duties and tries to bring them into line with some intelligible moral standard. But morality at different times has worn very different dresses. It has sometimes been thought of as an outward law, sometimes as an inward disposition; and each of these rival conceptions has developed a casuistical method of its own. Believers in law have put their trust in authority or logic; while believers in disposition chiefly look to our instinctive faculties—conscience, common-sense or sentiment. The legal is the older group, and to it the name of casuist is often exclusively reserved, generally with the implication that its methods are too purely technical to commend themselves to mankind at large. But common-sense and conscience are quite as definite guides as logic or authority; and there seems no good reason for refusing the name of casuistry to their operations.

The casuistry of primitive man is uncompromisingly legal. His morality is not yet separated from his religion; and religion for him means the cult of some superior being—the king or priest of his tribe—whose person is charged with a kind of sacred electricity. "His divinity is a fire, which, under proper restraints, confesses endless blessings; but if rashly touched, or allowed to break bounds, it burns or destroys what it touches. Hence the disastrous effects supposed to follow a breach of taboo; the offender has thrust his hand into the divine fire, which shrivels up and consumes him on the spot" (Frazer, The Golden Bough, i. 160). Elaborate rules are accordingly drawn up to secure the maximum of benefit, and the minimum of inconvenience, from this sacred fire. In the application of these rules does savage casuistry consist. At a higher stage of civilization the god is no longer present in person but issues to his worshippers categorical commands. These logic must seize upon and develop as far as they will go; for the breach of some trifling consequence of a rule might mean the loss of the deity's favour. Hence the rise of sacred books among most Eastern peoples. On the Jewish Decalogue, for instance, follows the law, and on the law the rabbinical schools. Some of these will be stricter, and some laxer; but on the whole all tend to "aggravate the law down to the point of forbidding the faithful to wear a girdle, or to kill a noxious insect on the Sabbath. Though indeed we might look nearer home than the Talmud for similar absurdities; most Puritan communities could furnish strange freaks of Sabbatarian casuistry. Nor have the Catholics been one whit behind them. Their scholastic doctors gravely discuss whether—since water is the ‘matter’ of baptism—a soul can be made regenerate by milk, or rose-water or wine.

At the opposite pole stood ancient Greece. Here ceremonial
casuistry found no place, because there were no sacred books. "Among the Greeks writing never attained the consecration of religion. No system of doctrine and observance, no manuals containing authoritative rules of morality, were ever transmitted in a documentary form. In conduct they shrank from formulas. Unvarying rules petrified action; the need of flexibility, of perpetual adjustment, was strongly felt" (Butcher, The Greek Genius, p. 132). For this reason their interest in ethical speculations was all the keener; their great thinkers were endlessly engaged in settling what the relation ought to be between duty and self-interest. Ought one to swallow up the other—and, if so, which should prevail? Or was it possible to patch up a compromise between them? The great Stoic philosophers took the austerest line, and held that duty should always and everywhere be our only law. But it was one thing to enunciate such magnificent theories in a lecture, and quite another to apply them in the market-place. Casuistry came to the aid of average human nature—that is to say, pupils began to confront the master with hard cases taken from daily life. And more than one master was disposed to make large—even startlingly large—concessions to the exigencies of practice. This concrete side of moral philosophy came specially to the Stoics, for their teachers held that justice had to be done to Rome. Cicero's De Officiis abounds in this kind of question afterwards so warmly discussed by Dr Johnson and his friends. Is it ever right to tell a lie? May a lawyer defend a client whom he knows to be guilty? In selling my goods, is it enough not to disguise their shortcomings, or ought I candidly to admit them? Seneca even made the discussion of such problems into a regular discipline, claiming that their concrete character gave an interest in morality to those who had no love for abstractions; while they prevented those who had from losing themselves in the clouds. And M. Thamin maintains that, if his heroes did not form great characters, at any rate they taught the Roman child to train its conscience. But, then, Cicero and Seneca took common-sense as their guide. They decided each problem on its merits, looking more to the spirit than to the letter, and often showing a practical sagacity worthy of Johnson himself. Quite in the great doctor's spirit is Cicero's counsel to his son, to hear what the philosophers had to say, but to decide for himself as a man of the world. Such advice could not be grateful to the philosophers, who were thus denied the "spiritual discipline" of a later Rome, who earned their bread by smoothing away the doubts of the scrupulous on all matters intellectual and moral. Their great weapon was their logic; and a logician, as Pascal says, must be very unfortunate or very stupid if he cannot manage to find exceptions to every conceivable rule. In their hands casuistry became the art of finding such exceptions. From the Greek sophists they borrowed ingenious ways of playing off one duty against another, or duty in general against self-interest—leaving the doubter in the alternative of neglecting the one and being a knave, or neglecting the other and being a fool. Or else they raised a subtle distinction between the act and the intention. To get drunk for the sake of the drink was the mark of a beast; but wine was a powerful stimulant to the brain, and to fuddle oneself in order to think great thoughts was worthy of a sage. No doubt these sly paradoxes were not always seriously taken; but it is significant that a common Roman proverb identified "philosophizing" (philosophatūr) with thinking out some dirty trick.

Christianity swept all the whole discussion on to a higher plane. At first it seemed to fall on the disposition, not on the outward act. The good deeds of a just man were a natural consequence of his justice; whereas a bad man was no whit the better, because he was now and then deviated into doing right. Actions, in short, were of no account whatever, apart from the character that produced them. "All things are lawful unto me," said St Paul, but all are not expedient." And St Augustine sums the whole matter up in the famous phrase: "Have charity, and do as thou wilt." Narrow-minded Christian consciences, however, could not stay long on this level; law was so very much more satisfying a guide than vague, elusive charity. And law in plenty was forthcoming, so soon as the Church developed the discipline of public confessions followed by appropriate penances for each fault. At first the whole proceeding was informal and impulsive enough; but by the 7th century it had grown thoroughly stereotyped and formal. Libri Poenitentialis began to appear—detailed lists of all possible sins, with the forfeit to be exacted from each. As public penance finally decayed, and auricular confession took its place, these were superseded by the Summae de Poenitentia—law-books in the strictest sense. These were huge digests of all that popes, councils, primitive fathers had decided on every kind of question pertaining to the confessional—what exactly is a sin, what kind of questions the priests must ask, under what conditions he could give absolution. As such, they were eagerly welcomed by the clergy; for a single magistrate, sitting in secret without appeal, necessarily grasps at whatever will lighten his burden of responsibility. Nor was their complexity a stumbling-block. The medieval mind was only too prone to look on morality as a highly technical art, quite as difficult as medicine or chancery law—a path where waylaying men were certain to err, with no guide but their unsophisticated conscience. What could they possibly do but cling to this priestly bond? "If Christ himself in considering the most of the things the Reformation was a violent protest. Catholicism increasingly took for granted that a man inquired his soul by thinking for himself; Protestantism replied that he could certainly lose it, if he left his thinking to another. For it is to the individual conscience that God speaks; through the struggles of the individual conscience he builds up a strong and stable Christian character "A man may be a heretic in the truth," says Milton in his Areopagitica (1644), "if he believes things only because his pastor says so, or the Assembly so determines, without knowing other reason, though his belief be true, yet the very truth he holds becomes his heresy. There is not any burden that some would not gladly post off to another than the charge and care of their religion. A wealthy man, addicted to his pleasures and his profits, finds religion to be a traffic so entangled, and of so many piddling accounts, that all of mysteries he cannot skill to keep a stock going upon that trade. What does he therefore but resolve to give over tolering, and find himself some factor, to whose care and conduct he may commit his spiritual concerns, some divine of note and estimation that must be. To him he adhers, resigns the whole warehouse of his religion with all the locks and keys into his custody, and indeed makes the very person of that man his religion. So that a man may say his religion is now no more within himself, but is become a divisible moveable, which goes or comes near him, according as that good man frequents the house." Twelve years after the Areopagitica appeared Pascal's Provincial Letters (1656–1657). These deal with the casuists of the Counter-Reformation in the spirit of Milton, laying especial stress on the artificiality of their methods and the laxity of their results. Not, of course, that they meant deliberate evil; Pascal expressly credits them with good intentions. But they were drawn, almost to a man, from Italy or Spain, the two countries least alive to the spirit of the Reformation; and most of them were Jesuits, the order that set out to be nothing Protestantism was, and everything that Protestantism was not. Hence they were resolutely opposed to any idea of reform; for to begin making changes in the Church's system would be a tacit admission that Luther had some merit on his side. On the other hand, they would certainly lose their hold on the laity, unless some kind of change were made; for many of the Church's rules were obsolete, and others far too severe to impose on the France of Montaigne or even the Spain of Cervantes. Thus caught between two fires the casuists developed a highly ingenious method, not unlike that of the Roman Stoics, for espressating the substance of a rule while leaving its shadow carefully intact. The next step was to force the confessors to accept their lax interpretation of the law; and this was accomplished by their famous theory of probabilism—first taught in Spain about 1580. This made it a grave sin in the priest to refuse absolution, wherever there
was some good reason for giving it even when there were other and better reasons for refusing it. This principle does not deserve all the abuse that has been lavished upon it. It secured uniformity in the confessional, and thereby protected the penitent from the caprices of individual preachers; and by depriving these of responsibility, it forced the penitent back on himself. But the gain was more than counterbalanced by the evil. The less the Church could expect from its penitents, the more it was driven to trust to the miraculous efficiency of sacramental grace. Once get a sinner to confession, and the whole work was done. However bad his natural disposition, the magical words of absolution would make him a new man. As for most penitents, all they cared for was to scrape through by the skin of their teeth. Casuistry might insist that it only proposed to fix the minimum of a minimum, and beg them for their soul's sake to aim a little higher. Human nature seldom resists the charms of a fixed standard—least of all when it is applied by a live judge in a visible court. If the priest must be satisfied with little, why be at the trouble of offering more? For this reason, casuistry found vigorous opponents in Bossuet and other eminent divines; and various of its excesses were condemned by the popes during the latter half of the 17th century. After a long eclipse it was finally re-established, though in a very modified form, by Alfonso Liguori about the middle of the 18th century. In Protestant countries casuistry shrank and dwindled, though works on the subject continued to be written both in Germany and England during the 17th century. The best known of the Anglican books is Jeremy Taylor's *Ductor Dubitantium* (1660). But the Protestant casuist never pretended to speak authoritatively; all he did was to give his reasons, and leave the decision to the conscience of his readers. "In all this discourse," says Bishop Sanderson, one of the best of the English writers, "I take it upon me not to write edicts, but to give my advice." Very soon, however, these relics of casuistry were swept away by the rising tide of common-sense. The 18th century loved to discuss hard cases of conscience, as a very cursory glance at Fielding's novels (1742-1751) or Boswell's *Life of Johnson* (1751) will show. But the age was scarcely suspicious of attempts to deal with such difficulties on any kind of technical system. Pope was never tired of girding at "Morality by her false guardians drawn, Chicanes in furs, and casuistry in lawn; while Fielding has embodied the popular conception of a casuist in Parson Thwackmuller. and the grand Squire of both worlds, only take to argument when they want to reason themselves out of some obvious duty. Still more outspoken is the Savoyard vicar in the *Émile* (1762) of Jean Jacques Rousseau: "Whence do I get my rules of action? I find them in my heart. All I feel to be good is good; all I feel to be evil is evil. Conscience is the best of casuists; it is only when men wish to cheat it that they fly to logical quibbles." Extravagant as this sentiment sounds, it paved the way to better things. The great object of 17th-century moralists had been to find some general principle from which the whole of ethics could be deduced; common-sense, by turning its back on abstract principles of every kind, forced the philosophers to come down to the solid earth, and start by inquiring how the world does make up its mind in fact. During the last two centuries deduction has gone steadily out, and psychology come in. Ethics have become more distinctively a science, instead of an awkward hybrid between a science and an art; their business has been to investigate what moral conduct is, not to lay down the law as to what it ought to be. Hence they deliberately refuse to engage in casuistry of the old-fashioned sort. Further, it is increasingly felt that ethical judgments do not depend on reason alone, but involve every element in our character; and that the real problem of practical morality is to establish a harmonious balance between the intelligence and the feelings—to make a man's "I think this is right," correspond with his "I feel that it is so." Whether systematic training can do anything to make the attainment of this balance easier is a question that has lately engaged the attention of many educational reformers; and whatever future casuistry may still have before it would seem to lie along the lines indicated by them.

There is an excellent study of the ancient casuists by M. Raymond Thomire, *Le casuisme moral dans l'antiquité* (Paris, 1884). For the 17th century, there are the works of Roman Catholic casuists see Döllinger und Reusch, *Moralstreitigkeiten im siebzehnten Jahrhundert* (2 vols., Nöridingen, 1889), and various articles ("Casuistik, Ethik, Moralismen," &c.) in *Wiener Jahrbücher* (1896), *Jahrbuch für Anthropologie, Ethik und Philosophie* (1899), *Sitzungsberichte der Königlichen Preussischen Akademie der Wissenschaften* (1896) and *The Annuals of Philosophy* (1885). Pope was himself a good casuist, and the opinions of Casuist, the English casuist, are included in his *Ethical Studies* (London, 1876). See also Hasting's *Rashdall, The Early Islamic Age* (London, 1907).

**CASUS BELLI—CAT**

**CASUS BELLI,** the technical term for cases in which a state holds itself justified in making war, if a certain course to which it objects is persisted in. Interference with the full exercise of a state's rights in the management of its internal affairs, an affront to its dignity, an unredressed injury, are instances of casus belii. Most of the new compulsory treaties of arbitration entered into by Great Britain and other states exclude from their application cases affecting the "vital interests" or "national honour" of the contracting states. These may therefore be considered as a sort of definition of casus belii in so far as the high contracting parties to them are concerned.

**CAT,** properly the name of the well-known domesticated feline animal usually termed by naturalists Felis domestica, but in a wider sense employed to denote all the more typical members of the family Felidae. According to the *New English Dictionary,* although the origin of the word "cat" is unknown, the name is found in various languages as far back as they can be traced. In old Western Germanic it occurs, for instance, so early as from A.D. 400 to 450; in old High German it is *chatus* or *catero,* and in Middle German *katte.* Both in Gaelic and in old French it is *cat,* although sometimes taking the form of *chater* in the latter; the Gaelic designation of the European wild cat being *cat fadhailch.* In Welsh and Cornish the name is *cath.* If Martial's *catae* refer to this animal, the earliest Latin use of the name dates from the 1st century of our era. In the work of Palladius on agriculture, dating from about the year A.D. 350, reference is made to an animal called *catus* or *catus,* as being useful in...
grainaries for catching mice. This usage, coupled with the existence of a distinct term in Gaelic for the wild species, leaves little doubt that the word "cat" properly denotes only the domesticated species. This is confirmed by the employment in Byzantine Greek of the term καττος or καττα to designate domesticated cats brought from Egypt. It should be added that the δαλαυος of the Greeks, frequently translated by the older writers as "cat," really refers to the marten-cat, which appears to have been partially domesticated by the ancients and employed for mousing.

As regards the origin of the domesticated cats of western Europe, it is well known that the ancient Egyptians were in the habit of domesticating (at least to some degree) the Egyptian race of the African wild cat (Felis ocreata maniculata), and also of embalming its remains, of which vast numbers have been found in tombs at Beni Hasan and elsewhere in Egypt. These Egyptian cats are generally believed by naturalists to have had a large share in the parentage of the European breeds, which have, however, in many cases been crossed to a greater or less extent with the European wild cat (Fel. catus).

One of the features by which the Egyptian differs from the European wild cat is the longer and less bushy tail; and it has been very generally considered that the same feature is characteristic of European domesticated cats. According, however, to Dr E. Hamilton, "the measurement of a number of tails of the [European] wild and of the domestic cat gives a range between 11 in. and 14½ in., the longer length being quite as often found in the wild cats as in the domestic. The bushy appearance depends entirely on the length of the fur, and accords with the thick fur of the rest of the body of the wild cat, while in the domestic race the fur both on the body and tail is thinner and softer."

Possibly those domesticated cats with unusually short and bushy tails may have a larger share of European wild-cat blood; whereas, conversely, such wild cats as show long tails may have a cross of domesticated blood.

More importance was attached by Dr A. Nehring of Berlin (SB. Ges. Naturfor., Berlin, 1887) to the colour of the soles of the hind-feet as a means of determining the relationship of the domesticated cat of Europe. According to his observations, in the Egyptian wild cat the pads of the toes are wholly black, while the black extends back either continuously or in long stripes as far as the calcaneum or heel-bone. In the European wild cat, on the other hand, the black is limited to a small round spot on the pads, while the colour of the hair as far back as the heel-bone is yellowish or yellowish-grey. Since in all domesticated cats retaining the colouring of the wild species the soles of the hind-feet correspond in this particular with the Egyptian rather than with the European wild cat, the presumption is in favour of their descent from the former rather than from the latter.

Later, Dr Nehring (op. cit. 1889) came to the conclusion that the domesticated cat has a dual parentage, one stock coming from south-eastern Asia and the other from north-eastern Africa; in other words, from a domesticated Chinese cat (itself derived from a wild Chinese species) on the one hand, and from the Egyptian cat on the other. The ordinary domesticated cats of Europe are, however, mainly of African origin, although they have largely crossed, especially in Germany (and probably also in Great Britain), with the wild cat. The same author was likewise of opinion that the domestication or taming of various species of wild cats took place chiefly among nationalities of stationary or non-nomadic habits who occupied themselves with agricultural pursuits, since it would be of vital importance that their stores of grain should be adequately protected from the depredations of rats and mice.

The foregoing opinion as to the dual parentage of our domesticated cats receives support from observations made many years ago by E. Blyth, who have recently been endorsed and amplified by R. I. Pocock (Proc. Zool. Soc. London, 1907). According to these observations, two distinct types of so-called tabby cats are recognizable. In the one the pattern consists of narrow vertical stripes, and in the other of longitudinal or obliquely longitudinal stripes, which, on the sides of the body, tend to assume a spiral or sub-circular arrangement characteristic of the blotched tabby. This latter type appears to be the true "tabby"; since that word denotes a pattern like that of watered silk. One or other of these types is to be found in cats of almost all breeds, whether Persian, short-haired, or Manx; and there appear to be no intermediate stages between them. Cats of the striped type are no doubt descended from the European and North African wild cats; but the origin of cats exhibiting the blotched pattern appears to be unknown. As it was to a cat of the latter kind that Linnaeus gave the name of Felis catus, Pocock urges that this title is not available for the European wild cat, which he would call Felis sylvestris. Without accepting this proposed change in nomenclature, which is liable to lead to confusion without any compensating advantage, it may be suggested that the blotched tabby type represents Dr Nehring's presumed Chinese element in the cat's parentage, and that the missing wild stock may be one of the numerous phases of the leopard-cat (F. bengalenis), in some of which an incipient spiral arrangement of the markings may be noticed on the shoulder.

As to the introduction of domesticated cats into Europe, the opinion is very generally held that tame cats from Egypt were imported at a relatively early date into Etruria by Phoenician traders; and there is decisive evidence that these animals were established in Italy long before the Christian era. The progeny of these cats, more or less crossed with the indigenous species, thence gradually spread over Europe, to become mingled at some period, according to Dr Nehring's hypothesis, with an Asiatic stock. The earliest written record of the introduction of domesticated cats into Great Britain dates from about a.d. 936, when Hywel Dda, prince of South Wales, enacted a law for their protection. "The Romans," writes Dr Hamilton, "were probably the original introducers of this cat, and as the final evacuation of Britain by that nation took place under the emperor Valentinian about a.d. 436, the period of its intoduction may certainly be dated some 500 years previous to the Welsh chronicle and even much earlier." It is added that the remains of cats from Roman villas at Silchester and Dursley are probably referable to the domesticated breed.

Before proceeding to notice some of the different types of domesticated cats, a few lines may be devoted to the wild European species, F. catus. Beyond stating that in colour it conforms very closely to the striped phase of domesticated tabby, it will be unnecessary to describe the species. Its geographical range was formerly very extensive, and included Great Britain, France, the Netherlands, Switzerland, Germany, Bohemia, Hungary, Poland, Transylvania, Galicia, the Caucasus as far as the Caspian, southern Russia, Italy, Spain, Greece, Rumania, Bulgaria, Servia, and portions of central and northern Asia. "At the present time," observes Dr Hamilton, "the wild cat has become almost extinct in many of the above districts. Examples may perhaps occasionally still be found in the uninhabited forests of Hungary and Transylvania, and occasionally in Spain and Greece, as well as in the Caucasus and in some of the Swiss cantons, but the original race has in most countries interbred with the domestic cat wherever the latter has penetrated."

In Great Britain wild cats survive only in some of the Scottish forests, and even there it is difficult to decide whether pure-bred specimens are extant. Remains of the wild cat occur in English caverns; while from those of Ireland (where the wild species has apparently been unknown during the historic period) have been obtained jaws and teeth which it has been suggested are referable to the Egyptian rather than to the European wild cat. Such a determination is, however, extremely hazardous, even if it be admitted that the remains of cats from the rock-fissures of Glenfaltar pertains to Felis catus.

The favourite haunts of the wild cat are mountain forests where masses or rocks or cliffs are interspersed with trees, the crevices in these rocks or the hollow trunks of trees affording sites for the wild cat's lair, where its young are produced and reared. In the Spanish plains, however, the young are often produced in nests built in trees, or among tall bamboo in
Note—Of the two types of colouration found in modern domestic cats, the striped type obviously corresponds to the original wild cat as seen in various parts of North Europe to-day. The origin of the blotched as a special type is wholly unknown.

(Photos from Plates VIII., IX., and X., P. Z. S., 1907, by permission of the Zoological Society of London.)
cane-brakes. "To fight like a wild cat" is proverbial, and wild cats are described as some of the most ferocious and untamable of all animals. How far this untamable character lends support to the view of the origin of our domesticated breeds has not yet been determined. Hares, rabbits, field-mice, water-rats, rats, squirrels, moles, game-birds, pigeons, and small birds, form the chief food of the wild cat.

Apart from the above-mentioned division of the striped members of both groups into two types according to the pattern of their markings, the domesticated cats of western Europe are divided into a short-haired and a long-haired group. Of these, the former is the one which bears the closest relationship to the wild cats of Africa and of Europe, the latter being an importation from the East. The striped (as distinct from the blotched) short-haired tabby is probably the one most nearly allied to the wild ancestors, the stripes being, however, to a great extent due to the European wild cat. In one direction the tabby shows a tendency to melanism which culminates in complete blackness, while in the other direction there is an equally marked tendency to albinism; grey cats, which may be regarded as tabbies whose stripes have disappeared, forming the connecting link between the tabby and the white cat. A mixture of the melanistic with the albinistic type will of course give rise to parti-coloured cats. A third colour-phase, the "erythristic" or red, is represented by the sandy cat, the female of which takes the form of the "tortoise-shell," characterized, curiously enough, by the colour being a blend of black, white, and sandy. The so-called orange tabby is one phase of the erythristic type.

As to long-haired cats, there appear originally to have been two closely-allied strains, the Angora and the Persian, of which the former has been altogether replaced in western Europe by the latter. That these long-haired cats have an ancestry, to some extent at any rate distinct from the ordinary short-haired breeds, is practically certain, and it has been suggested that the breed derived from the "manul" cat (Felis manul), of the deserts of central Asia, which is a long-haired and bushy-tailed species with comparatively slight striping. The fact that in tabby Persians the body-markings are never so strong as in the short-haired breeds is in some degree confirmatory of this, as suggesting descent from a nearly wholly-coloured type. At the present day, however, Persians exhibit nearly all the colour and pattern types of the short-haired breeds, the "orange Persian" representing the erythristic phase.

Turning to the tailless or so-called Manx cats, in which the tail should be represented merely by a tuft of hair without any remnant of bone, it seems that the strain is to be met with in many parts of Russia, and there is a very general opinion that it originally came from Japan or some other far eastern country. Throughout Japan, China, Siam, and the Malay countries, normal long-tailed cats are indeed seldom seen. Instead of these are cats which are derived from shorter-tailed ancestors, or a less degree a decided kink or bend near the tip. In other cases the tail is of the short curling type of that of a bulldog; sometimes it starts quite straight, but divides in a fork-like manner near the tip; and in yet other instances it is altogether wanting, as in the typical Manx cats. These kink-tailed or tailless cats are moreover smaller in size than the ordinary short-tailed breeds, with rather longer hair, whose texture approaches that of rabbit-fur, and a cry said to be like that of the jungle-cat (F. chaus) of India and Africa, and more dog-like habits. Unless the jungle-cat, which is a nearly wholly-coloured species, can claim the position, the ancestry of these Manx-Malay cats is still unknown. Kink-tailed cats, it should be added, are also known from Madagascar.

Among the domesticated cats of India a spotted type of colouring, with a more or less decided tendency for the spots to coalesce into stripes, is very noticeable; and it is probable that these cats are derived from the spotted Indian desert-cat (F. ornata), with a certain amount of crossing from other species. The so-called F. torquata of India is probably based on cats of this type which have reverted to the wild state. Other Indian cats with a tawny or fulvous type of colouring are probably the more or less modified descendants of the jungle-cat. From the same stock may be derived the Abyssinian breed, in which the ears are relatively large and occasionally tipped with long hairs (thus recalling the tufted ears of the jungle-cat). The colour is typically reddish-brown, each individual hair being "ticked" like that of a wild rabbit, whence the popular name of "bunny cat." Another African breed is the Mombasa cat, in which the hair is reported to be unusually short and stiff.

By far the most remarkable of all the Old World domesticated breeds is, however, the royal Siamese cat, which almost certainly has an origin quite distinct from that of the ordinary European breeds; this being rendered evident not only by the peculiar type of colouring, but likewise by the cry, which is quite unmistakable. Siamese cats may have the tail either straight or kinked, but whether the latter feature belongs to the breed, or has been acquired by crossing with the ordinary black and tabby kink-tailed cats of the country, is not known. In the royal Siamese breed the head is rather long and pointed, the body also elongated with relatively slender limbs, the coat glossy and close, the eyes blue, and the general colour some shade of cream or pink, with the face, ears, feet, under-parts, and tail chocolate or seal-brown. There is however a wholly chocolate-coloured strain in which the eyes are yellow. The most remarkable feature about the breed is that the young are white. "The kittens," observes a lady writer, "are born absolutely white, and in about a week a faint pencilling comes round the ears, and gradually all the points come. At four or five months they are lovely, as generally they retain their baby whiteness, which contrasts well with their almost black ears, deep-brown markings, and blue eyes." In constitution these cats are extremely delicate. The blue eyes and the white coat of the kitten indicate that the Siamese breed is a semi-albino, which when adult tends towards melanism, such a combination being apparently unknown in any other animal. If the frequent presence of a kink in the tail be an inherent feature, the breed is evidently related to the other kink-tailed Malay cats which, as already stated, have a cry differing from that of European cats. Should this be so, then if the ordinary Malay cats are the descendants of the jungle-cat, we shall have to assign the same ancestry to the Siamese breed.

Although definite information on this point is required, it seems probable that the southern part of North America and South America possessed certain native domesticated breeds of cats previous to the European conquest of the country; and if this be so, it will be obvious that these breeds must be derived from indigenous wild species. One of these breeds is the Paraguay cat, which when adult weighs only about three pounds, and is not more than a quarter the size of an ordinary cat. The body is elongated, and the tail, especially on the tail, short and close. This wild-clawed and long-tailed cat suggests origin from the jaguarundi (P. jaguarondi), a chestnut-coloured wild species; but information appears to be lacking with regard to the colouring of the domesticated breed. Another South American breed is said to be free from the hideous "cater-wauling" of the ordinary cat. In old days New Mexico was the home of a breed of hairless cats, said to have been kept by the ancient Aztecs, but now well-nigh if not completely extinct. Although entirely naked in summer, these cats developed in winter a slight growth of hair on the back and the ridge of the tail.

Catabolism, or CATABOLISM (Gr. κατά, down, βοῦς, a throw), the biological term for the reverse of anabolism, namely the breaking down of complex into simpler substances, destructive metabolism (see Physiology).

Cataclysm (Gr. κατακλυσμος, a deluge), a great flood or deluge (q.v.). The term is used in geology to denote an
overwhelming catastrophe which has produced sudden changes in the earth's surface; and also, figuratively, of any great and violent change which sweeps away the existing social or political order. 

CATACOMB, a subterranean excavation for the interment of the dead or burial-vault. In this sense the word "catacomb" has gained universal acceptance, and has found a place in most modern languages. The original term, *catacombe*, however, had no connexion with sepulture, but was simply the name of a particular locality in the environs of Rome. It was derived from the Greek κατακόμβη, "a hollow," and had reference to the natural configuration of the ground. In the district that bore this designation, lying close to the Appian Way, the basilica of San Sebastiano was erected, and the extensive burial-vaults beneath that church—which, according to tradition, the bodies of the apostles St Peter and St Paul rested for a year and seven months previous to their removal to the basilicas which bear their names—were, in very early times, called from it coemeterium ad catacombs, or catacombas alone. From the celebrity of this cemetery as an object of pilgrimage its name became extensively known, and in entire forgetfulness of the origin of the word, *catacombe* came to be regarded as a generic appellation for all burial-places of the same kind. This extension of the term to Christian burial-vaults generally dates from the 4th century, and obtained gradual currency through the Christian world. The original designation of these places of sepulture is *crypta* or *coemeterium*. 

The largest number of Christian catacombs belong to the 3rd and the early part of the 4th centuries. The custom of subterranean interment gradually died out, and entirely ceased with the sack of Rome by Alaric, A.D. 410. "The end of the catacomb graves," writes Mommsen (Cont. Rev., May 1871), "is intimately connected with the end of the powerful city itself. . . . Poverty took the place of wealth, . . . the traditions of the Christian tomb-architects sank into utter insignificance, and the expanse of the wasted Campagna now offered room enough to bury the few bodies, without having to descend as once far down below the surface of the earth." The earliest account of the catacombs, that of St Jerome narrating his visits to them when a schoolboy at Rome, about A.D. 354, shows that interment in them was even then rare if it had not been altogether discontinued; and the poet Prudentius's description of the tomb of the Christian martyr Hippolytus, and the cemetery in which it stood, leads us to the same conclusion. With the latter part of the 4th century a new epoch in the history of the catacombs arose—of religious art. In the time of Pope Damasus, A.D. 360-384, the catacombs had begun to be regarded with special devotion, and had become the resort of large bands of pilgrims, for whose guidance catalogues of the chief burial-places and the holy men buried in them were drawn up. Some of these lists are still extant. 1 Pope Damasus himself displayed great zeal in adapting the catacombs to their new purpose, restoring the works of art on the walls, and renewing the epitaphs over the graves of the martyrs. In this latter work he employed an engraver named Furius Philocalus, the exquisite beauty of whose characters enables the smallest fragment of his work to be recognized at a glance. This gave rise to extensive alterations in their construction and decoration, which has much lessened their value as authentic memorials of the religious art of the 2nd and 3rd centuries. Subsequent popes manifested equal ardour, with the same damaging results, in the repair and adornment of the catacombs, and many of the paintings covering their walls, which have been assigned to the period of their original construction, are really the work of these later times. The catacombs shared in the devastation of Rome by the Goths under Vitiges in the 6th century and by the Lombards at a later period; and partly through the spoilation of these barbarian invaders, partly through the neglect of those who should have been their guardians, they sank into such a state of decay and pollution that as the only means of preserving the holy remains they enshrined from further desecration, Pope Paul I., in the latter part of the 8th century, and Pope Paschal, at the beginning of the 9th, entered upon the work of the translation of the relics, which was vigorously carried on by successive pontiffs until the crypts were almost entirely despoiled of their dead. The relics having been removed, the visits of pilgrims naturally ceased, and by degrees the very existence of those wonderful subterranean cemeteries was forgotten. Six centuries elapsed before the accidental discovery of a sepulchral chamber by some labourers digging for pozolana earth (May 31, 1578) revealed to the amazed inhabitants of Rome "the existence," to quote a contemporary record, "of other cities concealed beneath their own suburbs." Baronius, the ecclesiastical historian, was one of the first to visit the new discovery, and his *Annals* in more than one place evidence his just appreciation of its importance. The true "Columbus of this subterranean world," as he has been aptly designated, was the indefatigable Antonio Bosio (d. 1629), who devoted his life to the personal investigation of the catacombs, the researches which were given to the world in 1632 in a huge folio, entitled *Roma subterranea*, profusely illustrated with a few but faithful plans and engravings. This work was published in a Latin translation with considerable alterations and omissions by Paolo Aringhi in 1651; and a century after its first appearance the plates were reproduced by Giovanni Bottari in 1737, and illustrated with great care and learning. Some additional discoveries were described by Marc Antonio Boldetti in his *Osservazioni*, published in 1720; but, writing in the interests of the Roman Church with an apologetic, not a scientific object, truth was made to bend to polemics, and little addition to our knowledge of the catacombs is to be gained from his otherwise important work. The French historian of art, Seroux d'Agincourt, 1825, by his copious illustrations, greatly facilitated the study of the architecture of the catacombs and the works of art contained in them. The works of Raoul Rochette display a comprehensive knowledge of the whole subject, extensive reading, and a thorough acquaintance with early Christian art so far as it could be gathered from books, but he was not an original investigator. The great pioneer in the path of independent research, which, with the intelligent use of documentary and historical evidence, was less so vast an increase in our knowledge of the Roman Catacombs than Padre Marchi of the Society of Jesus. His work, *Monumenti delle antiche cristiane primitive*, is the first in which the strange misconception, received with unquestioning faith by earlier writers, that the catacombs were exhausted sand-pits adapted by the Christians to the purpose of interment, was dispelled, and the true history of their formation demonstrated. Marchi's line of investigation was followed by the Comandatore De Rossi, and his brother Michele, the former of whom was Marchi's fellow-labourer during the latter part of his explorations; and it is to them that we owe the most exhaustive scientific examination of the whole subject. The Catacombs of Rome are the most extensive with which we are acquainted, and, as might be expected in the centre of the Christian world, are in many respects the most remarkable. No others have been so thoroughly examined and illustrated. These may, therefore, be most appropriately selected for description as typical examples. 

Our description of the Roman Catacombs cannot be more appropriately introduced than by St Jerome's account of his visits to them in his youth, already referred to, which, after the lapse of above fifteen centuries, presents a most accurate picture of these wonderful subterranean labyrinths. "When I was a boy," he writes, "receiving my education in Rome, I and my schoolfellows used, on Sundays, to make the circuit of the sepulchres of the apostles and martyrs. Many a time did we go down into the catacombs. These are
excavated deep in the earth, and contain, on either hand as you enter, the bodies of the dead buried in the wall. It is all so dark there that the language of the prophet (Ps. lv. 15) seems to be fulfilled, 'Let them go down quick into hell.' Only occasionally is light let in to mitigate the horror of the gloom, and then not so much through a window as through a hole. You take each step with caution, as, surrounded by deep night, you recall the words of Virgil:

"Horror ubique animos, simul ipsa silentia terrer." 1

In complete agreement with Jerome's vivid picture the visitor to the Roman Catacombs finds himself in a vast labyrinth of narrow galleries, usually from 3 to 4 ft. in width, interspersed with small chambers, all excavated at successive levels, in the strata of volcanic rock subjacent to the city and its environs, and constructed originally for the interment of the Christian dead. The galleries are not the way of access to the cemeteries, but are themselves the cemeteries, the dead being buried in long low horizontal recesses, excavated in the vertical walls of the passages, rising tier above tier like the berths in a ship, from a few inches above the floor to the springing of the arched ceiling, to the number of five, six or even sometimes twelve ranges. These galleries are not arranged on any definite plan, but, as will be seen from the plan (fig. 1), they intersect one another at different angles, producing an intricate network which it is almost impossible to reduce to any system. They generally run in straight lines, and as a rule preserve the same level. The different storeys of galleries lie one below the other (fig. 2) to the number of four or five (in one part of the cemetery of St Calixtus they reach seven storeys), and communicate with one another by stairs cut out of the living rock. Light and air are introduced by means of vertical shafts (luminaria) running up to the outer air, and often serving for several storeys. The drawing (fig. 3) from Northcote gives a very correct idea of these galleries, with the tiers of graves pierced in the walls. The doorways which are seen interrupting the lines of graves are those of the family sepulchral chambers, or cubicula, of which we shall speak more particularly hereafter.

The graves, or loculi, as they are commonly designated, were, in the Christian cemeteries, with only a few exceptions (Padre Marchi produces some from the cemetery of St Ciriaca, Monum. primitiv. tav. xiv. xliii. xlv.), parallel with the length of the gallery. In the pagan cemeteries, on the other hand, the sepulchral recess as a rule entered the rock like an oven at right angles to the corridor, the body being introduced endways. The plan adopted by the Christians saved labour, economized space, and consulted reverence in the deposition of the corpse. These loculi were usually constructed for a single body only. Some, however, were formed to contain two, three, or four, or even more corpses. Such recesses were known respectively as bisoni, trisoni, quadrisoni, &c., terms which often appear in the sepulchral inscriptions. After the introduction of the body the loculi were closed with the greatest care, either with slabs of marble the whole length of the aperture, or with huge tiles, being generally employed, cemented together with great exactness so as to prevent the escape of the products of decomposition (fig. 4). Where any epitaph was set up—an immense number are destitute of any inscription at all—it is usually painted or engraved on these slabs or tiles. In the earlier interments the

---

1 Hieron., Comment. in Ezech. lib. xx. c. 40. The translation is Dean Burgon's.
epitaph is usually daubed on the slab in red or black paint. In later examples it is incised in the marbles, the letters being rendered clearer by being coloured with vermillion. The enclosing slab very often bears one or more Christian symbols, such as the dove, the anchor, the olive-branch, or the monogram of Christ (figs. 5, 6). The palm branch, which is also of frequent occurrence, is not an indisputable mark of the last resting-place of a martyr, being found in connexion with epitaphs of persons dying natural deaths, or those prepared by persons in their lifetime, as well as in those of little children, and even of pagans. Another frequent concomitant of these catacomb interments, a small glass vessel containing traces of the sediment of a red fluid, embedded in the cement of the loculus (fig. 7), has no better claim. The red matter proves to be the remains of wine, not of blood; and the conclusion of the ablest archaeologists is that cloths, or swathed in bands, and were frequently preserved by embalming. In the case of poorer interments the destruction of the body was, on the contrary, often accelerated by the use of quicklime.

Interment in the wall-recess or loculus, though infinitely the most common, was not the only mode employed in the catacombs.

![Fig. 2.—Section of Galleries at different levels. (From Seroux d'Agincourt.)](image)

Other forms of very frequent recurrence are the table-tomb and arched tomb, or arcosolium. From the annexed woodcuts it will be seen that these only differ in the form of the surmounting recess. In each case the arched tomb was formed by an oblong chest, either hollowed out of the rock, or built of masonry, and closed with a horizontal slab. But in the table-tomb (fig. 8) the recess above, essential for the introduction of the corpse, is square, while in the arcosolium (fig. 9), a form of later date, it is semicircular. Sarcophagi are also found in the catacombs, but are of rare occurrence. They chiefly occur in the earlier cemeteries, and the costliness of their construction confined their use to the wealthiest classes—e.g. in the cemetery of St Domitilla, herself a member of the imperial house. Another unfrequent mode of interment was in graves like those of modern times, dug in the floor of the galleries (Marchi, p.s.; tav. xxi. xxvi.). Table-tombs and arcosolia are by no means rare in the corridors of the catacombs, but they belong more generally to the cubicula, or family vaults, of which we now proceed to speak.

These cubicula are small apartments, seldom more than 12 ft. square, usually rectangular, though sometimes circular or polygonal, opening out of the main corridors. They are not unfrequently ranged regularly along the sides of the galleries, the doors of entrance, as may be seen in a previous illustration (fig. 3), following one another in an orderly succession as the bedchamber doors in the passage of a modern house. The roof is sometimes
CATACOMB

493

flat, but is more usually vaulted, and sometimes rises into a cupola. Both the roof and the walls are almost universally coated with stucco and covered with fresco paintings—in the earlier works merely decorative, in the later always symbolical or historical. Each side of the cubiculum, except that of the entrance, usually contains a recessed tomb, either a table-tomb or an arcosolium. That facing the entrance was the place of greatest honour, where in many instances the remains of a martyr were deposited, whose tomb, according to primitive usage, served as an altar for the celebration of the eucharist. This was sometimes, as in the Papal crypt of St Calixtus (fig. 10), protected from irreverence by lattice work (transennae) of marble. The cubiculum was originally designed for the reception of a very limited number of dead. But the natural desire to be buried near one's relatives caused new tombs to be cut in the walls, above and around and behind the original tombs, the walls being thus completely honeycombed with loculi, sometimes as many as seventy, utterly regardless of the paintings originally depicted on the walls. Another motive for multiplying the number of graves operated when the cubiculum contained the remains of any noted saint or martyr. The Christian antiquity has cause continually to lament the destruction of works of art due to this craving. One of the most perfect examples of early Christian pictorial decoration, the so-called "Dispute with the Doctors," in the catacomb of Calixtus, the "antique style of beauty" of which is noticed by Kugler, has thus suffered irreparable mutilation, the whole of the lower part of the picture having been destroyed by the excavation of a fresh grave-recess (Bottari, vol. ii. tav. r5). The plates of De Rossi, Perret, and, indeed, all illustrations of the catacombs, exhibit frequent examples of the same destructive superstition. The illustrations (figs. 11 and 12), taken from De Rossi's great work, representing two of the cubicula in the cemetery of St Calixtus, show the general arrangement of the loculi and the character of the frescoes which ornament the walls and roof. These paintings, it will be seen, are simply decorative, of the same style as the wall-paintings of the baths, and those of Pompeii. Each cubiculum was usually the burying-place of some one family, all the members of which were interred in it, just as in the chantry-chapels connected with medieval churches. In them was celebrated the funeral-feast on the day of burial and on its anniversary, as well as the eucharist, which was the invariable accompaniment of funerals in the primitive church (Bingham,

FIG. 10.—Restoration of the Papal Crypt, Cemetery of St Calixtus. (From de Rossi.)

Orig. Eccl. bk. xxiii. c. iii. 12). The funeral-banquet descended to the Christian church from pagan times, and was too often profaned by heathen licence. St Augustine, in several passages, inveighs against those who thus by "gluttony and insobriety buried themselves over the buried," and "made themselves drunk in the chapels of the martyrs, placing their excesses to the score of religious reverence for the dead" (August., De Mor. Eccl. Cathol. c. 34; Contr. Faust. lib. xx. c. 21; Confess. lib. vi. c. 2). Some curious frescoes representing these funeral-feasts, found in the cubicula which were the scene of them, are
reproduced by Bosio (pp. 355, 391) and others. A romantic air has been thrown over these burial chapels by the notion that they were the places of worship used by the Christians in times of persecution. This to a certain extent is doubtless true, as in the case of the chapel of Santa Priscilla, where the altar or stone coffin of a martyr remains, with a small platform behind it for the priest or bishop to stand upon. But that they can have been so used to any large extent is rendered impossible by their limited dimensions, as none of them could hold more than fifty or sixty persons. In some of the catacombs, however, there are larger halls and connected suites of chapels which may possibly have been constructed for the purpose of congregational worship during the dark periods when the public exercise of the Christian religion was made penal. The most remarkable of these is in the cemetery of Sant' Agnese (see plan, fig. 13). It consists of five rectangular compartments, three on one side of the corridor and two on the other, connected by a passage intersecting the gallery at right angles. Two of the five compartments are supposed to have been assigned to male, and two to female worshippers, the fifth, at the extremity of the whole, being reserved for the altar and its ministers. In the centre of the end-wall stands a stone chair (fig. 14), considered to have been the episcopal cathedra, with a bench for the clergy on each side. There is no trace of an altar, which may, Marchi thinks, have been portable. The walls of the compartments are occupied by arched sepulchral recesses, above and below which are tiers of ordinary graves or loculi. The arrangements are certainly such as indicate a congregational purpose, but the extreme narrowness of the suite, and still more of the passage which connects the two divisions, must have rendered it difficult for any but a small number to take any intelligent part in the services at the same time. Although the idea of the use of the catacombs for religious worship may have been pressed too far, there can be no doubt that the sacred rites of the church were celebrated within them. We have already spoken of the eucharistic celebrations of which the cubicula were the scene; and still existing baptisteries prove that the other sacrament was also administered there. The most remarkable of these baptisteries is that in the catacomb of San Pontianus (fig. 15). Ten steps lead down to a basin of sufficient depth for immersion, supplied by a spring. Some of the subterranean chambers contain armed seats and benches cut out of the tufa rock. These are supposed by Marchi and others to indicate schoolrooms, where the catechumens were instructed by the bishop or presbyters. But this theory wants verification. It is impossible not to be struck with the remarkable analogy between these rock-hewn chairs and those discovered in the Etruscan tombs, of the purpose of which no satisfactory explanation has been given.

Very exaggerated statements have been made as to the employment of the catacombs as dwelling-places by the Christians in times of persecution. We have, however, sufficient evidence that they were used as places of refuge from the fury of the heathen, in which the believers—especially the bishops and clergy, who would naturally be the first objects of attack—might secrete themselves until the storm had blown over. This was a purpose for which they were admirably adapted both by the intricacy of their labyrinthine passages, in which any one not possessing the clue would be inevitably lost, and the numerous small chambers and hiding-places at different levels which might be passed unperceived in the dark by the pursuers. As a rule also the catacombs had
more than one entrance, and frequently communicated with an arena is or sand-quarry; so that while one entrance was carefully watched, the pursued might escape in a totally different direction by another. But, to quote J. H. Parker, "the catacombs were never intended, nor fit for, dwelling-places, and the words of persons living in them for months are probably fabulous. According to modern physicians it is impossible to live many days in the caves of poszolana in which many of the catacombs are excavated." Equally exaggerated are the statements as to the linear and lateral extent of the catacombs, and their intercommunication with one another. Without resorting to this exaggeration, Mommsen can speak with perfect truth of the "enormous space occupied by the burial vaults of Christian Rome, not surpassed even by the cloaca or sewers of Republican Rome," but the data are too vague to warrant any attempt to define their dimensions. Marchi has estimated the united length of the galleries at from 800 to 900 m., and the number of interments at between 6,000,000 and 7,000,000; Martigny's estimate is 587 m.; and Northcote's, lower, at "not less than 350 m."

The idea of general intercommunication is negatived by the fact that the chief cemeteries are separated by low ground or valleys, where any subterranean galleries would be at once filled with water.

It now remains to speak of the history of these subterranean burial-places, together with the reasons for, and mode of, their construction. From the period of the red-letter of the catacombs from the fourth century till comparatively recent times a gigantic fallacy prevailed, repeated by writer after writer, identifying the Christian catacomb-places with disused sand-pits. It was accepted as an unquestionable fact by every one who undertook to describe the catacombs, that the Christians of Rome, finding in the labyrinthine mazes of the exhausted arenae, which abounded in the environs of the city, where the sand used in building had been extracted, a suitable place for the interment of their martyred brethren, where also the sacred rites accompanying the interment might be celebrated without fear of interruption, took possession of them and used them as cemeteries. It only needed a comparison of the theory with the visible facts to refute it at once, but nearly three centuries elapsed before the independence of the arenae and the catacombs was established. The discovery of this independence is due to Marchi. Starting with the firmest belief in the old traditional view, his own researches by degrees opened his eyes to the truth, now universally recognized, that the catacombs were exclusively the work of the Christians, and were constructed for the interment of the dead. It is true that a catacomb may sometimes be found in the earth or sandpit, but, as the discovery of the Christians preferred to adopt that which Minucius Felix calls "the better, and more ancient custom of inhumation" (Octavius, c. 2), there was absolutely nothing, to quote the words of Northcote (Roma subterr., pp. 56, 61), either in their social or religious position to interfere with their freedom of action. The law left them entire liberty, and the faithful did but seek in the way that suited them best, burying their dead according to a fashion to which many of them had been long accustomed, and which enabled them at the same time to follow in death the example of him who was also their model in life. Interment in rock-hewn tombs, "as the manner of the Jews is to bury," had been practised in Rome by the Jewish settlers for a considerable period anterior to the rise of the Christian Church. A Jewish catacomb, now lost, was discovered and described by Bosio (Rom. sott. p. 141), and others are still accessible. They are to be distinguished from Christian catacombs only by the character of their decorations, the absence of Christian symbols and the language of their inscriptions. There would, therefore, be nothing extraordinary in the fact that a community, always identified in the popular heathen mind with the Jewish faith, should adopt the mode of interment belonging to that religion. Nor have we the slightest trace of any official interference with Christian burials, such as would render secrecy necessary or desirable. Their funerals were as much under the protection of the law, which not only invested the tomb itself with a sacred character, but included in its protection the area in which it stood, and the cela memoriae or chapel connected with it, as those of their heathen fellow-citizens, while the same shield would be thrown over the burial-club, which, as we learn from Tertullian...

---

1 In Rome the three strata are known to geologists as tufa litoide, tufa granolare and poszolana. 

2 Cicero is our authority for the burial of Marius, and for Sulla's being the first member of the Gens Cornelia whose dead body was burnt (De Legg. II. 22).
(A. pol., c. 39), were common among the early Christians, as some other existing among the heathen population of Rome.

We may then completely dismiss the notion of there being any studied secrecy in connexion with the early Christian cemeteries, and proceed to inquire into the mode of their formation. Almost without exception, they had their origin in small burial areas, the property of private persons or of families, gradually ramifying and receiving additions of one subterranean storey after another as each was required for interments. The first step would be the acquisition of a plot of ground either by gift or purchase for the formation of a tomb. Christians were not beyond the pale of the law, and their faith presented no hindrance to the property being secured to them in perpetuity. To adapt the ground for its purpose as a cemetery, a gallery was run all round the area in the tufa rock at a convenient depth below the surface, reached by staircases at the corners. In the upper walls of these galleries localia were cut as needed to receive the dead. When these first four galleries were full others were mined on the same level at right angles to them, thus gradually converting the whole area into a net-work of corridors. If a family vault was required, or a burial chapel for a martyr or person of distinction, a small square room was excavated by the sides of the gallery and communicating with it. When the original area had been mined in this way as far as was consistent with stability, a second storey of galleries was begun at a lower level, reached by a new staircase. This was succeeded by a third, or a fourth, and sometimes even by a fifth. When adjacent burial areas belonged to members of the same Christian confraternity, or by gift or purchase fell into the same hands, communications were opened between the respective cemeteries, which thus spread laterally, and gradually acquired that enormous extent which, "even when their fabulous dimensions are reduced to their right measure, form an immense work." This could only be executed by a large and powerful Christian community unimpeded by legal enactments or police regulations, "a living witness of its immense development corresponding to the importance of the capital." But although, as we have said, in ordinary times there was no necessity for secrecy, yet when the peace of the Church was broken by the fierce and often protracted persecutions of the heathen emperors, it became essential to adopt precautions to keep in secrecy the entrance to the cemeteries, which revealed the temporary hiding-places of the Christian fugitives, and to haffle the search of their pursuers. To these stormy periods we may safely assign the alterations which may be traced in the staircases, which are sometimes abruptly cut off, leaving a gap requiring a ladder, and the formation of secret passages communicating with the cemenariae, and through them with the open country.

When the storms of persecution ceased and Christianity had become the imperial faith, the evil fruits of prosperity were not slow to appear. Cemetery interment became a regular trade in the hands of the fossore, or grave-diggers, who appear to have established a kind of property in the catacombs, and whose greed of gain led to that destruction of the religious paintings with which the walls were decorated, for the quarrying of fresh localia, to which we have already alluded. Monumental epigraphs record the purchase of a grave from the fossore, in many cases during the lifetime of the individual, not infrequently stating the price. A very curious fresco, found in the cemetery of Calixtus, preserved by a line of drawings of the earlier investigators (Bottari, tom. ii. p. 126, tav. 90), represents a "fossor" with his lamp in his hand and his pick over his shoulder, and his tools lying about him. Above is the inscription, "Diogenes Fossor in Pace depositus." It is unnecessary to enter on any detailed description of the frescoes which cover the walls and ceilings of the burial-chapels in the richest abundance. It must suffice to say that the earliest examples are only to be distinguished from the mural decorations employed by their pagan contemporaries (as at Pompeii and elsewhere) by the absence of all that was immoral or idolatrous, and that it was only very slowly and timidly that any distinctly religious representations were introduced. These were at first purely symbolic, meaningless to any but a Christian eye, such as the Vine, the Good Shepherd, the Shepherd, the Fisherman, the Fish &c. Even the personages of ancient mythology were pressed into the service of early Christian art, and Orpheus, taming the wild beasts with his lyre, symbolized the peaceful sway of Christ; and Ulysses, deaf to the Siren's song, represented the Believer triumping over the allurements of sensual pleasure. The person of Christ appeared but rarely, and then commonly simply as the chief personage in an historical picture. The events depicted from the life of Christ are but few, and always conform rigidly to the same traditional type. The most frequent are the miracle at Cana, the multiplication of the loaves and fishes, the paralytic carrying his bed, the healing of the woman with the issue of blood, the raising of Lazarus,
Catacombs differ materially from those of Rome. They were certainly originally stone-quarries, and the hardness of the rock has made the construction practicable of wide, lofty corridors and spacious halls, very unlike the narrow galleries and contracted chambers in the Roman cemeteries. The mode of interment, however, is the same as that practised in Rome, and the loculi and arcostolia differ by little in the two. The walls and ceilings are covered by locked doors, the marks of the hinges and staples being still visible. The walls are in many places coated with stucco being still visible. The walls are in many places coated with stucco adorned with frescoes, including palms, doves, labara and other Christian symbols. The ground-plans (figs. 19, 20), from Agincourt, of the catacomb and of one of the circular halls, show how widely this cemetery differs in arrangement from the Roman catacombs. The frequency of blind passages and of circular chambers will be noticed, as well as the very large number of bodies in the cruciform recesses, apparently amounting in one instance to nineteen. Agincourt remarks that this cemetery "gives an idea of a work executed with design and leisure, and with means very different from those at command in producing the catacombs of Rome."

Denon also describes catacombs at Malta near the ancient capital of the island. The passages were all cut in a close-grained stone, and are very narrow, with arched ceilings, running very irregularly, and ramifying in all directions. The greater part of the tombs stand on either side of the galleries in square recesses (like the table-tombs of the Roman catacombs), and are rudely fashioned to imitate sarcophagi. The interments are not nearly so numerous as in other catacombs, nor are there any vestiges of painting, sculpture or inscriptions. At Taormina in Sicily is a Saracen catacomb, also figured by Agincourt. The main corridor is 12 ft. wide, having three or more ranges of loculi on either side, running longitudinally into the rock, each originally closed by a stone bearing an inscription.

Passing to Egypt, a small Christian catacomb at Alexandria is described and figured by de Rossi. The loculi here also are set endways to the passage. The walls are abundantly decorated with paintings, one of a liturgical character. But the most extensive catacombs at Alexandria are those of Egyptian-Greek origin, from the largest of which, according to Strabo (lib. xvii. p. 795), the quarter where it is placed had the name of the Necropolis. The plan, it will be seen, is remarkable for its regularity (figs. 21, 22). Here, too, the graves run endways into the rock. Other catacombs in the vicinity of the same city are described by Pocock and other travellers, and are figured by Agincourt.

Subterranean cemeteries of the general character of those described are very frequent in all southern and eastern countries. A vast necropolis in the environs of Saïda, the ancient Sidon, is described in Renan's Mission en Phénicie, and figured in Thobois's plates. It consists of a series of apartments approached by staircases,
CATACOMB

the sides pierced with sepulchral recesses running lengthwise into the rock.

The rock-hewn tombs of Etruria scarcely come under the category of catacombs, in the usual sense, being rather independent family burial-places, grouped together in a necropolis. They are, however, far too remarkable to be altogether passed over. These sepulchres are usually hollowed out of the face of low cliffs on the side of a hill. They often rise tier above tier, and are sometimes all on the same level “facing each other as in streets, and branching off laterally into smaller lanes or alleys”; and

hewn from the rock. Opening out of this and the other chambers, and connecting them together, are a series of low winding passages or *cuniculi*, just large enough for a man to creep through on all fours. No plausible suggestion has been offered as to the purpose of these mysterious burrows, which cannot fail to remind us of the labyrinth which, according to Varro’s description as quoted by Pliny (Hist. Nat. lib. xxxvi. c. 19, § 4), was the distinguishing mark of Porsena’s tomb, and which have led some adventurous archaeologists to identify this sepulchre with that of the great king of Etruria (Dennis, u.s., pp. 393 ff.). (E. V.; O. M. D.)

**Modern Discoveries.—** In 1873 was discovered, near the cemetery of St Domitilla, the semi-subterranean basilica of Santi Nereo ed Achilleo, 100 ft. by 60 ft. This is now covered with a roof, and the fallen columns have been raised up. The lower part of a pillar, which once supported a baldachino over the altar, still preserves the name *Achilleus*, and beneath it a bas-relief of the martyr, with his hands bound, receiving his death-blow from the executioner. The base of a similar column has only feet in the same attitude, and probably bore the name *Nereus*. In a grave in the apse was found a large fragment of an inscription, composed by Pope Damasus, but set up by his successor Siricius, which, from the note-book of a Salzburg pilgrim of the 8th century, can be completed thus:

Military nemone dedenter saevum
Oflcium pariter spectantes juss
Præcepitis pulsante metu servi
Mira fides rerum subito posse
Conversa fugiunt ducis inpia car
Projiciunt clupeos falerni tel
Confessi gaudent Christi portar
Credite per Damasum possit quid

Nereus (see Rom. xvi. 15) and Achilleus, said to have been baptized by St Peter, refused to do the bidding of Domitian as praetorians, and entering the service of Flavia Domitilla, suffered martyrdom with their mistress Petronilla, of the Aurelian family closely connected with the Flavii, and the spiritual daughter of St Peter, who was buried in a sarcophagus with the inscription:—

*AVRELIAE•PETRONILAE•FIL•DVLCISSIMAE*

This is now in St Peter’s, but was probably originally behind the apse of this basilica, for there is a fresco of her in an arcosolium, with a matron named Veneranda. The original entrance to the cemetery leads directly into a spacious corridor with no *loculi*, but recesses for sarcophagi, and decorations of the classical style of the 2nd century. From this a wide staircase leads directly down to a chamber, discovered in March 1881, of a very early date. Within an arcosolium is a tablet set up by “Aurelius Ampliatus and his son Gordian, to Aurelia Bonifatia, his in- comparable wife, a woman of true chastity, who lived 25 years, 2 months, 4 days, and 2 hours.” The letters are of the 2nd century; but above the arcosolium was found a stone with great letters, 5 or 6 in. high: “AMPLIAT, the tomb of Ampliatus.” Now Ampliatus is a servile name: how comes it to be set up with such distinction in the sepulchre of the Flavii? Romans xvi. 8 supplies the answer: “Salute Ampliatus, most

![Fig. 23. Plan of a Tomb at Cervetri. (From Dennis.)](image)

Occasionally forming “a spacious square or piazza surrounded by tombs instead of houses” (Dennis, Cities and Cemeteries of Etruria, ii. 31). The construction of the tombs commonly keeps up the same analogy between the cities of the living and those of the dead. Their plan is for the most part that of a house, with a door of entrance and passage leading into a central chamber or *atrium*, with others of smaller size opening from it, each having a stone-hewn bench or *triclinium* on three of its sides, on which the dead, frequently a pair of corpses side by side, were laid as if at a banquet. These benches are often hewn in the form of couches with tablets at one end, and the legs carved in relief. The ceilings have the representation of beams and rafters cut in the rock. In some instances arm-chairs, carved out of the living rock, stand between the doors of the chambers, and the walls above are decorated with the semblance of suspended shields. The walls are often covered with paintings in a very simple archaic style, in red and black. As a typical example of the Etruscan tombs we give the plan and section (figs. 23, 24) of the Grotta della Sedia at Cervetri from Dennis (pp. 32, 33). The tombs in some instances form subterranean groups more analogous to the general idea of a catacomb. Of this nature is the very remarkable cemetery at Poggio Gaiella, near Chiusi, the ancient Chusium, of a portion of the principal storey of which the woodcut (fig. 25) is a plan. The most remarkable of these sepulchral chambers is a large circular hall about 25 ft. in diameter, supported by a huge cylindrical pillar

![Fig. 24. Section of the Tomb of the Seats and Shields, Cervetri. (From Dennis.)](image)

![Fig. 25. Plan of a portion of the principal storey in the Poggio Gaiella. (From Dennis.)](image)
beloved to me in the Lord." De Rossi thinks the identification well grounded (Bulletino, 1881, p. 74). Epitaphs of members of the Flavian family have been found here, and others stating that they are put up "Ex indigentia Flaviae Domitiae Versians Neptis." So that De Rossi did not hesitate to complete an inscription on a broken stone thus:

De Rossi began his excavations in the cemetery of Santa Prisca in 1851, but for thirty years nothing but what had been described by Bosio came to light. In 1880 he unearthed a portion near the Cappella Greca, and found galleries that had not been touched since they were filled in during the Diocletian persecution. The loculi were intact and the epitaphs still in their places, so that they form a kind of museum, in which the development, the formulae, and the symbolic figures of Christian epigraphy, from its origin to the end of the 3rd or 4th century, can be noticed and contemplated, not in artificial specimens as in the Lateran, but in the genuine and living reality of their original condition. (Bullett., 1884, p. 68). Many of the names mentioned in St Paul's Epistles are found here: Phoebe, Priscus, Aquilus, Felix, Amphialus, Epenetus, Olympia, Onesimus, Philemon, Asyncritus, Linus, Julia, Caius, Timothy, Tychicus, Crescens, Urbanus, Hermogenes, Tryphaena and Tryphosa (on the same stone). Petrus, a very rare name in the catacombs, is found here several times, both in Greek and in Latin. The neighbouring Coemeterium Ostrianum was anciently known as "Fons S. Petri," "ubi Petrus baptizavit," "ubi Petrus prius sedid." This cemetery derives its name from Priscilla, mother of Publius, who is said to have given hospitality to St Peter the Apostle. We are reminded of St Paul, and of his friends Aquila and Prisca, by a monument erected by an imperial freedman who was praefectus tabernaculorum—chief tentmaker. In 1888 a corridor was discovered which had at one time been isolated from the rest of the cemetery. It had no loculi, but recesses in the wall to receive sarcophagi. At the end of the corridor there was a large chamber, 23 ft. by 13 ft., once lined with marble and the ceiling covered with mosaic, a few fragments of which still remain. The only tomb here was a sarcophagus, of which the broken front bears the letters which show it to have been the epitaph of one of the Acilian family:

Acilio Glabrioni Filio

In the vicinity are fragments of the epitaphs of Manius Acilius and Prisca, of Quintus Acilius and Caia Acilia in Greek, another Greek inscription "Acilus Rufinus most thou live in God." After careful examination of the nine Acili, who were consuls, De Rossi concludes that this was the resting-place of that Acilius Glabrio, consul with Trajan, a.d. 91, who in the year of his consulate was compelled by Domitian to fight with beasts in the arena, and then banished and put to death in 95. The question of his Christianity seems settled by the discovery of the sepulchre of these Christian Acili. From this tomb a staircase led up to the basilica in which Pope Silvester was buried, and on the whole plan of which was laid bare by De Rossi. The tomb of St Silvester could be identified, and that of Pope Syricus "at his feet," as the pilgrim noted (Bullett., 1890, pp. 106-110).

Just before De Rossi's death, Mgr. Wilpert discovered in the Cappella Greca a painting of the "Fratric Panis" or eucharistic feast, which he cleansed from the dust with which it had been covered. The picture of the Blessed Virgin and Child, which De Rossi ascribed to the 2nd, if not to the 1st century, has received an unexpected proof of its antiquity. In 1890 the floor of the gallery in which it stands was excavated, and another floor was found to be 6 ft. below its supposed level. The loculi in this lower portion were intact, with inscriptions of the 2nd century still in their places, proving that the niche in which that picture was painted must have been considerably older than the lowering of the floor. A flight of iron steps enables the visitor now to examine this venerable specimen of early Christian art.

After the death of De Rossi, one of his pupils, H. Stevenson, since dead, discovered in 1896 a small subterranean basilica in the catacomb of Santi Pietro e Marcellino on the Via Labicana, with pious acclamations on the platter similar to those in the Papal crypt in St Calixtus. Near the well-known subterranean chapel in the Coemeterium Ostrianum was discovered by Mgr. Crostarosa, in 1877, another chapel, in which Signor Armellini found traces of St Emerentiana, foster-sister of St Agnes. Near this a whole region of galleries has been brought to light with loculi intact.

Explorations conducted in the cemetery of Domitilla in 1897-1898 brought to light a fine double crypt with frescoes representing Christ seated between six male and female saints; also an inscription relating to a new saint (Eualius) in a cubicle of the 3rd century. In 1899-1900 were discovered two opposite cubicula in the catacomb of Santi Pietro e Marcellino. These were unknown to Bosio, and are both covered with frescoes, the vault being in one case decorated with the scene which represents Christ seated among the apostles and pronouncing sentence upon Judas. An inscription discovered on one side of the ancient cemetery of St Cirica, and dating from a.d. 405, states that one Euryalus bought a site ad mensam hostis martyrili Laurentii from a certain fonsor whose name has been erased. This is interesting as an example of what was known as memoriae damnativa or the blotting out of a name on account of some dishonourable action. From the end of the 4th to the first half of the 5th century, the fonsorae had the privilege of selling sites, which frequently led to grave abuses. In 1901-1902 excavations in the cemetery of Santa Priscilla, near the Cappella Greca, revealed a polygonal chamber. This may have originally been the nymphaeum of the great villa of the Acili Glaibriones, the hypogaeum of which was discovered by De Rossi near this spot in 1888. It may have been used as a burial-place for martyrs, and Professor Marucchi is inclined to see in it the sepulchral chapel of Pope Marcellinus, who died in a.d. 304 during the persecutions of Diocletian. In 1902, in that part of the Via Ardeatina which passes between the cemeteries of Calixtus and Domitilla, was discovered a crypt with frescoes and the sanctuary of a martyr:

It is thought that this, rather than a neighbouring crypt brought to light in 1897, may prove to be the sepulchral crypt of SS. Marcus and Marcellianus. In a cubicle leading out of a gallery in the vicinity there was also discovered an interesting impression in plaster of an inscription of the mother of Pope Damasus, beginning:

Hic Damasi Mater Fosvit Lavren[nia Membran].

In the same year building operations in the Via di Sant' Onofrio revealed the presence of catacombs beneath the foundations: examination of the loculi showed that no martyrs or illustrious persons were buried here.

In 1903 a new cemetery with frescoes came to light on the Via Latina, considered by Marucchi to have belonged to a heretical sect. In the same year the Jewish cemetery on the Via Portuense, known to Bosio but since forgotten, was rediscovered. The subterranean basilica of SS. Felix and Adactus, discovered by Boldetti and afterwards choked up with ruins, was cleared again: the crypt, begun by Damasus and enlarged by Siricius, contains frescoes of the 6th-7th centuries.

A good plan of the catacombs at Albano (at the 15th milestone of the Appian way), discovered by Boldetti and described by De Rossi, has been published by Marucchi (Nuovo Bulletin di archeologia cristiana, 1902, pp. 89 ff.). In 1904 a small subterranean cemetery was discovered at Anagia. Catacombs have also been recently discovered on the site of Hadrumetum near Souss in Tunisia.

Authorities.—The classical work on the catacombs of Rome is G. B. De Rossi's Roma sotterranea, on which most of the accounts in other languages than Italian have been based. The fine volume by Mgr. Wilpert, Le Piture delle catacombe romane (Rome, 1903), in which all the important frescoes are reproduced in colours, is to be regarded as an addition to the Roma sotterranea. All new
CATALEPSY (from Gr. κατάθλησις, a seizure), a term applied to a nervous affliction characterized by the sudden suspension of sensation and volition, accompanied with a peculiar rigidity of the whole or of certain muscles of the body. The subjects of catalepsy are in most instances females of highly nervous temperament. The exciting cause of an attack is usually mental emotion operating either suddenly, as in the case of a fright, or more gradually in the way of prolonged depression. The symptoms presented vary in different cases, and even in the same individual in different attacks. Sometimes the typical features of the disease are exhibited in a state of complete insensibility, together with a statue-like appearance of the body which will retain any attitude it may be made to assume during the continuance of the attack. In this condition the whole organic and vital functions appear to be reduced to the lowest possible limit consistent with life, and to such a degree as to simulate actual death. At times the mental excitement will accompany the cataleptic symptoms, and the patient will sing or utter passionate exclamations during the fit, being all the while quite unconscious. The attack may be of short duration, passing off within a few minutes. It may, however, last for many hours, and in some rare instances persist for several days; and it is conceivable that in such cases the appearances presented might be mistaken for a sudden itinerant of the brain, and occasionally such cases have been confused with the spasm of the mind.

Catalaunya or Cataluña (Catalan: Catalunya), a country in Spain, in the Pyrenees, bounded on the N. by the Pyrenees, on the E. by Aragon, on the S. by the Mediterranean Sea, and on the W. by France and Navarre. The province of Catalonia comprises the mountains of the Pyrenees, and the principal towns are Barcelona, Girona, Lérida, and Tarragona. The capital of Catalonia is Barcelona, which is the chief town and seaport. It is the most important city in Spain, and is situated on the coast of the Mediterranean Sea, about 124 miles N. of Valencia. The city is built on a promontory of the coast, and is connected with the mainland by a peninsula. The district is rich in manufactures, and is celebrated for its fine woolens, lace, and silk. The capital of Catalonia is a remarkable city, with a population of about 400,000. It is the seat of the Catholic Church, and is the most important city in Spain.

Catalánuca (Catalan: Catalánuca), a city in Spain, in the province of Barcelona, on the coast of the Mediterranean Sea, about 124 miles N. of Valencia. The city is built on a promontory of the coast, and is connected with the mainland by a peninsula. The district is rich in manufactures, and is celebrated for its fine woolens, lace, and silk. The capital of Catalonia is a remarkable city, with a population of about 400,000. It is the seat of the Catholic Church, and is the most important city in Spain.
